Blanche McManus's *American Woman Abroad*² differs in many ways from Mr. Pollard's book, but no more conspicuously in any respect than in the fact that it aims at being, up to a certain point, directly instructive. No doubt many a reader will find the introductory chapter on the cost of living abroad valuable indeed. So, too, the following chapters: Servants and the Servant Question, Markets and Marketing, Some Housekeeping Experiences, etc. In spite of the fact that a great part of the volume is thrown into the anecdotal or conversational form, the standpoint of the author is predominantly practical; and she has

¹VAGABOND JOURNEYS: THE HUMAN COMEDY AT HOME AND ABROAD. By Percival Pollard. New York: The Neale Publishing Co. Pp. 328. \$2.

²THE AMERICAN WOMAN ABROAD. Written and profusely illustrated by Blanche McManus. New York: Dodd, Mead & Co. Pp. 534. \$2.

much to tell her readers of what the lone woman traveler may expect, what women may find in the shops, what tipping amounts to, and so forth. Sketching grounds, winter sports in Switzerland, touring clubs, the hotels and cafés, auto-mobiling abroad, all have their chapters. An interesting novelty is the abstract of French law for foreigners. Not the least noteworthy feature is the charming illustration of the book in black and white.

Pleasing, no less, are the drawings which, with colored reproductions of paintings by A. H. Hallam Murray, illustrate Julia Cartwright's *The Pilgrims' Way*.³ From Winchester to Canterbury is the route. The volume has already appeared, in different dress and with different illustrations, but is neither less instructive, nor less good reading, for that.

The fourth of our English-made travel books describes voyages Oriental.⁴ The writer is a London surgeon, who shipped for the Far East in his professional capacity in order to enjoy a temporary change from London fog—and to take something like a rest cure. As surgeon to the steamship "Clytemnestra" he fared from Liverpool to Port Said, and took delight in observing the ways of "the old man" (the "Clytemnestra's" captain) and the Chinese stewards. The Indian Ocean and its ports—Japan and the shops and streets and tea houses of its coast towns; all these matters have been treated by many another before the author of *The Surgeon's Log* yielded to every traveler's temptation; yet his book is genially and engagingly, if not brilliantly, composed. Several chapters are devoted to impressions of Java and Batavia.

Martin Luther

THE perennial interest in Luther and his work is occasionally heightened by the discovery and publication of new materials, the observance of special anniversaries, and the opening of fresh lines of attack and defense in the theological struggle that has been carried on over the cleft which Luther's work made in

the religious life of Germany, not to say of the western world. The celebration of the fourth centennial of the reformer's birth nearly thirty years ago gave a stimulus to Luther study which has resulted in many valuable finds in German and Italian libraries, in the writing of vigorous biographies from both the Protestant and Catholic standpoints, and in the production of some exhaustive monographs on mooted points such as Luther's intellectual development and his connection with the double marriage of the Landgrave of Hesse. As was natural, the research work has been done largely by German Protestants, but Catholic investigators and helpers from other lands have not been wanting, and their efforts are bearing legitimate fruit in worthy contributions to Luther literature. Witness to this last statement is borne by three new lives of Luther,* each of special value and significance, and all coming from non-Lutheran sources. It must be said, however, that these investigations and additions to biographical material have not changed the general lines of the picture of Luther, altho much light has been thrown on particular episodes and phases of his career. Indeed, the new estimates of Luther and his work have been elicited largely by a changed attitude on the part of his biographers. Older writers regarded his life as necessarily involved in estimating Protestantism, and sought in retelling his life story to justify or stultify the course and present existence of Protestant separation from Rome. Fortunately, a better day is dawning, in which Protestants will no longer feel it incumbent upon them to defend Luther's theology and morals, or look for his sanction as a bulwark to their own faith; and Roman Catholics will find it increasingly difficult to justify their claims by vilifying the life and work of their most powerful opponent. Signs of this new day are quite apparent in the most striking of the recent biographies of Luther.

*MARTIN LUTHER, THE MAN AND HIS WORK. By Arthur Cushman McGiffert. New York: The Century Company. \$3.

THE LIFE AND LETTERS OF MARTIN LUTHER. By Preserved Smith, Ph.D. Boston: Houghton Mifflin Company. \$3.50.

LUTHER. Von Hartmann Grisar, S. J., Professor an der K. K. Universität Innsbruck, Drei Bände. Erster Band: Luther's Werden. Zweiter Band: Auf der Höhe des Lebens. St. Louis, Mo.; Herdersche Verlagshandlung. Band I, \$3 90; Band II, \$4.50.

³THE PILGRIM'S WAY, FROM WINCHESTER TO CANTERBURY. By Julia Cartwright. New York: E. P. Dutton & Co. Pp. 225. \$5.

⁴THE SURGEON'S LOG: BEING IMPRESSIONS OF THE FAR EAST. By J. Johnston Abraham. With forty-four illustrations. New York: E. P. Dutton & Co. Pp.

that by Professor McGiffert, of Union Theological Seminary. The book is published without preface, notes or bibliography, for it is evidently meant, not for the scholar or theologian, but for the intelligent lay reader. The author has put into popular form the stirring story of Luther's life, pointed out its relations to the movements of the time, and interpreted the reformer's significance for the modern world. Professor McGiffert's portrait of the great German is that of a hero who in a critical period embodied and exemplified the passions and purposes of his people. "To a degree true of few great men he was a child of his age and its mouthpiece." His theological

If Professor McGiffert's book is to be regarded as the best popular work on Luther, Dr. Preserved Smith's volume must surely be accorded the first place in the library of the student and preacher. It is not, however, written from the theological point of view, and it is free from ecclesiastical bias and prepossession. The efforts of the author are directed toward an accurate delineation of Luther's career and an intimate knowledge of the man himself in all his mental, moral and physical characteristics. To accomplish well this double purpose Dr. Smith has thoroly acquainted himself with the latest researches in the details of Luther biography, and has

CLOISTER OF THE AUGUSTINIAN MONASTRY IN ERFURT AS IT
WAS IN LUTHER'S TIME
(Century)

and ecclesiastical conceptions are not treated as subjects of special interest in themselves, but only as they reveal the man or bear upon his work as a successful leader in the uprising against prevalent abuses and a revolt against oppressive power. This account of Luther, based on the most recent and careful scholarship, is written with due perspective in a style that is clear in expression and swift in movement. The reader gains a distinct impression of the larger outlines of Luther's life and work, while the details are not distorted or too much obscured. The work falls little short of being an ideal popular life of a great man.

studied carefully the reformer's writings, particularly his "table talk" and letters, wherein Luther most fully reveals himself. The author does not hesitate to present the evidences of Luther's grossness as well as those of his greatness. He does not try to justify Luther's harshness and blunders in the matters of the Peasants' Revolt and the bigamy of Philip, but regards the reformer's relations to both as the greatest blots upon his career. One of the pleasantest features of the book is the large number of Luther's letters freshly translated by the author into excellent English. An unusual and altogether welcome side of Luther, whose

outward and public life was so crowded and stormy, is shown in such delightful and sometimes playful letters as the one concerning the Diet of Birds, or that directed to his little son, Hans, or the simulated complaint against Wolfgang, his servant. It is characteristic of Dr. Smith's work that these translations do not misrepresent the spirit of the original, but they are often so far from being literal that they would not stand the strain of polemical usage. Occasional notes and a good bibliography add to the serviceableness of the volume.

When we turn from these American studies to the extended biography of Luther by Prof. Hartmann Grisar, S. J., University of Innsbruck, we find ourselves at once in another atmosphere of investigation and presentation, as well as in another language (German). The changed point of view is signaled in the introduction, where the author declares that the question of Luther's divine mission is a point of highest interest, and, while but one chapter is specifically devoted to it, nevertheless it is really under general consideration thruout the whole work. This, then, we may expect to be a biography in which the old religious interests and controversies are predominant, however well they may be held in leash and regulated by a high regard for scientific accuracy. But the author's avowed purpose of freeing the life of Luther from all legendary elements and his emphasis on the objectivity and un-polemical character of his work lead one to expect many departures from the type of Luther biography presented in Denifle's book, the tone and content of which Grisar himself severely criticised. And this expectation is largely fulfilled by a reading of the two bulky volumes already published. Scores of derogatory stories and incidents which have been associated with Luther are cast aside as worthless, altho generally given first in full detail. There is usually a reserve in pronouncing judgment and always a lack of violence and invective, which distinguish Professor Grisar's method from that of many Catholic writers on this subject.

He gives no countenance to the moral aspersions that have been cast on Luther's early career, and dissents from

the theory that moral corruption was the occasion of his revolt from Rome. He is always careful to present both Protestant and Catholic views of contested points, and his results are enforced by a large array of evidence. Some of the features of Professor Grisar's work which call for special attention are his emphasis on Luther's superficial knowledge of scholasticism and early departure from Catholic standards of teaching, his theory of a bitter strife on the part of Luther against the "observants" of his order, and the assignment of the real origin of Luther's revolt to these causes, reinforced by the reformer's contentious nature, his pride, self-consciousness and other like elements of his peculiar psychological make up. Indeed, one gets the impression that the author's main effort is directed toward accounting for Luther's life and work on the basis of his unusual psychological development and character as opposed to the notion of his religious inspiration and reaction against current abuses. Grisar would say that Luther made his surroundings rather than his surroundings him, and that in the process the sources of his inspiration were by no means the divinest elements in human nature. In presenting this view the author can hardly be called impartial. It is necessary to use much conjecture and to do some violence to Luther's statements in order to find a place for his struggle with the "observants." Side by side with impartial judgments frequently stand unwarranted inductions from some of Luther's fugitive utterances, enforced by the suspicions of his enemies. The groupings of Luther's sayings on particular themes, especially when torn from their contexts and pieced together by a running commentary from the author, are more liable than not to give false or distorted impressions of Luther's ideas and character. Such blemishes tend strongly to weaken confidence in Grisar's work, yet it must be said that if the third volume maintains the same standard as these two, this Luther biography will take its place as the best Catholic contribution to the subject, altho it will add nothing to our knowledge of the man and contribute but little toward revealing the secret of his power.

CHARLES E. HESSELGRAVE.

The Door in the Wall and Other Stories.

By H. G. Wells. Illustrated with photogravures from photographs by Alvin Langdon Coburn. 15 x 11 inches. Edition limited to 600 copies. New York: Mitchell Kennerley. \$7.50.

This sumptuous edition of some of Wells's earliest stories shows how he has advanced in public esteem. Some of us already have them in our scrap books, clipped from stray magazines or Sunday supplements, as they first appeared, in smudgy and careless print, and treasured thru the years as we only treasure the jewels we have discovered for ourselves in the mass of rubbish which pours from the press. And to such early lovers of Wells it is an especial delight to find them now, for the first time, in a setting worthy of their unique character; on paper that it gives one a thrill of sensuous delight to shut one's eyes and feel of, printed with type designed by F. W. Goudy, whose taste in typography is unexcelled in America, and illustrated by A. L. Coburn, whose photographs harmonize with the illusive atmosphere of the tales. From the purely literary point of view Mr. Wells has never done anything better than these, for he was most of a poet when he was most of a scientist, and since he has gone in so heavily for sociology he has lost that delicacy of touch and suggestion of symbolism which were the charm of his first work. Some of these eight tales contain in miniature the germ of his later novels, and we can discern in them the folded cotyledons that afterward were expanded into the full grown plant. "The Star," for example, is the first sketch of "In the Days of the Comet," and the tale is vastly superior to the novel in effectiveness. In the "Dream of Armageddon" we see the author's first vision of that future state of society, commercialism, relentlessly carried to the extreme, which he afterward developed in detail in "When the Sleeper Wakes." But the most brilliant achievement of his imaginative symbolism is "The Country of the Blind," the story of an isolated valley of the Andes, whose inhabitants had long since gone blind when an explorer tumbled into their midst. He recalled the proverb "In the country of the blind the one-eyed man is king," and prepared to demonstrate his superiority. But he

finds himself at a disadvantage at once, and fights a losing battle against the power of public opinion. A single individual, even exceptionally gifted, is powerless to disturb seriously a settled and organized community. The people laugh at his pretensions to superior vision, his stories of distant mountains and other lands. One young girl is captivated by these poetical fancies of his and loves him because of them, but refuses to take him as a husband until he is cured by a surgical operation, which, by removing his eyeballs, will make a normal man of him. What his decision was and whether it was the right one we will leave to the reader's imagination and judgment. If he knows the author he will know his solution.

A Little Pilgrimage in Italy. By Olive M. Potter. With 8 colored plates and 89 other illustrations by Yoshio Markino. Pp. 360. Boston: Houghton Mifflin Co. \$4.

One of the most handsome travel-books recently published is this Italian Pilgrimage, printed in Edinburgh, and issued with the Houghton Mifflin im-

THE LAMPLIGHTER AT GUBLIO
From a drawing by Yoshio Markino, illustrating
"A Little Pilgrimage in Italy" (Houghton)

print. The illustrations lend much of its attractiveness, and are notable in their variety of subject and method; so that the volume is for no consideration to be overlooked because it treats of a well-traveled road. The chapters on Arezzo, Siena, Perugia, and other towns of northern and central Italy are written by one who commands a graceful style and brings to her writing love of the land, its traditions, and its literature.

Literary Notes

....“The Pigeon,” John Galsworthy’s latest play, is a fantasy on the subject of charity. Mr. Walkley, of the *London Times*, writes that the pockets of the hero, one Christopher Wellwyn, “are ‘spiritually’ one enormous hole. Sympathy for the outcasts, just friendliness, liking, is what he feels.” His pensioners include a flower girl, a Frenchman and a cabman. “Then comes the parson, who preaches repentance and reform.” There are other reformers—a professor and a J. P. These, and the somewhat sentimental hero, argue and quarrel about the protégés, who do not prosper under these conditions. The play has been selected for the opening of Mr. Ames’s Little Theater in New York.

....Besides *The Pigeon*, Mr. Ames is to produce Arthur Schnitzler’s *Anatol*. This “sequence of dialogs,” all of them cynical and most of them brilliant, had been “paraphrased for the English stage” by Mr. Granville Barker (Mitchell Kennerley; \$1), who produced it in London. We are informed that Mr. Ames does not plan to use the Barker version: and this is regrettable, for as a translator the Englishman has turned out a piece of work much more striking than any of his original plays. *Anatol*, an idle young bachelor of Vienna, his friend Max, and various ladies of *Anatol*’s acquaintance (as well as of Max’s) move thru the scenes of this frankly unmoral “sequence” with all the illusion of life. The effectiveness of the stage production of *Anatol* is conditioned only by the cleverness of the company presenting it, and the good judgment of the stage director in eliminating the less vital episodes.

....A little volume on *The Culture of Ancient Israel* (Bloch), by Aaron P. Drucker, M. A., contains an enthusiastic account of the art, music, poetry and drama of the Hebrews as evidenced in the Old Testament. The author would have done better had he adopted still more of the results of modern criticism and pressed less vigorously the claims for the drama.

....We call the attention of students of the deeper aspects of the labor problem to *Attitude of American Courts in Labor Cases*, by George G. Groat, Professor of Economics and Sociology in Ohio Wesleyan University. It is scholarly and breaks new ground (New York: Longmans, Green & Co.; \$2).

....Abundant information about the writings, royal scribes and keepers of archives of the ancient Egyptians will be found in E. C. Richardson’s delightful essay on *Old Egyptian Librarians* (Scribners; 75 cents). The facts are drawn from such sources as the Book of the Dead and Prof. Breasted’s Ancient Records.

....Alys Hallard has very admirably translated from the French of the lady who signs herself Pierre de Coulevain. *The Heart of Life* (Dutton, pp. 401; \$1.25). The author is a master of platitude whose sentiment, however, is often admirable and whose popularity is considerable. Here we have introspection, retrospection, and passing comment on all the kinds of people one meets at German and Swiss resorts no less than at Paris; all of it very leisurely in style and with a wealth of literary and casual allusion.

....Special interest attaches to the books by Robert Louis Stevenson shown in the Houghton Mifflin Co. exhibition of bindings by Miss L. Averill Cole, at the publishers’ rooms in Fifth avenue, New York. Every volume contains an inscription by the author to the restaurant-keeper of Monterey, and the “Jekyll and Hyde” dedication suggests that a far stranger case than that described would be R. L. S. forgetting Jules Simoneau, or Simoneau forgetting R. L. S. The restaurant keeper was, before his emigration to America, a prosperous merchant of Nantes; but in the years following Stevenson’s departure from California he sank lower and lower, and took to peddling *tamales* in the streets. Simoneau always refused to sell his Stevensons, however, and when he died, in 1908, at the age of eighty-nine years, he directed that the books should be sold only on condition that they be permanently preserved as one collection, and that they should not go out of the State of California. Nor have they done so, permanently; they are the property of a San Francisco bibliophile who has had them rebound by Miss Cole—one of the best known and most able of American binders. The design is of laurel leaves inlaid in greens and purples on olive-green levant. The linings are of purple silk. The books are shown in a chest of Monterey cypress wood elaborately carved and bound with wrought copper. The Stevenson-Simoneau collection is only a part of Miss Cole’s exhibition, which closes on March 9.

....There are some fine inspirational chapters for Lenten reading in Dr. Arthur W. Robinson's *Spiritual Progress* (Longmans) to which the Bishop of London has written a laudatory introduction.

....*Great Pictures as Moral Teachers* (Winston Co., Phila.), by Henry E. Jackson, contains twenty reproductions with rambling remarks about some moral lesson suggested to the author by each picture or its title. The artistic judgments are no better than the literary style.

....The lectures of Rev. John Barbour, D.D., delivered originally at Princeton Theological Seminary on "The Importance of Music to the Culture and Work of the Ministry" are worthy of wide reading on the part of ministers and theological students, and their publication by the author under the title *Ministers and Music* (Maysville, Ky.; 50 cents) is most welcome.

....The translator of *Family Letters of Richard Wagner*, Mr. Ellis, describes this new contribution to the biography of the composer as "delightful"; but, important tho the letters are to one who wishes to know all the circumstances and psychology of the master, we find the letters rather too much concerned with Wagner's need of money in the beginning and insistence upon good contracts at the end. The volume extends to something over 300 pages and would run far beyond this limit if the pronoun of the first person singular did not fortunately take up so little space. (*Family Letters of Richard Wagner*, translated by William Ashton Ellis. Macmillan, pp. 307; \$1.35.)

....Edgar Jepson has enriched our acquaintance by introducing us to *Pollyooly* (Bobbs-Merrill; \$1.25) a delightful little London girl, who at the age of twelve, attempts the support of her small self and a baby brother called "The Lump." She becomes the dignified housekeeper of a whimsical young barrister in the Inner Temple, and if the reader is immediately reminded of Dick Swiveller and the Marchioness, and they are pleasant old acquaintances to be recalled. Pollyooly and the Hon. John Ruffin are quite as fascinating and much more respectable, and their adventures in the city of London are absolutely original. We leave the tiny heroine learning to dance, that she may go on the stage, for a schoolboy scion of the English nobility informs her that: "Fellows don't marry housekeepers. But if you're going on the stage—dancing too—that makes it all right." And as we are quite sure that nothing can spoil Pollyooly, with her clear little head and her loving devotion to the Lump, we would not thwart her honorable ambition.

Pebbles

TOWNE—I used to think that the best thing to cure a cold was whisky, but on second thought—

Drowne—You mean on "sober second thought," I suppose?

"AND now, sir," thundered the bullying lawyer, "tell the court what you were doing in the interim."

"I never went there," retorted the witness, indignantly; "I stayed in the smokeroom all the evening."—*New York Evening Mail*.

ANOTHER correspondent says that it is safe to say nine out of every ten—some say ninety out of every hundred—of the people even in the imperial province are in sympathy with the rebels.—*Missionary Herald*.

FOR history as she is remade consult the *Congressional Record*. This from the oration of Martin E. Dies, tribune of the people from Texas:

"Like the Bourbons of old, he [the Peerless Leader] has learned nothing and forgotten nothing. He has profited nothing from the lessons of Moscow, Leipzig, and Waterloo."

Such is fame in the mouth of a Congressman!

KING GEORGE was visiting at a country house near the scene of one of Oliver Cromwell's battles. Strolling out one morning alone he met the village blacksmith. "I say, my good fellow," said his Majesty, genially, "I understand there was a big battle fought here?"

"Well-er," stammered the blacksmith, recognizing and saluting the King, "I did 'ave a round or two with Bill the postman, but I didn't know your Majesty 'ad 'card of it."—*Boston Transcript*.

IN DOUBT.

Carolyn Wells, in Life.

We read an author's printed fame,
And yet how can we speak his name?

Do you suppose it is the thing
To talk of Mr. J. M. Synge?

Is that of syllables too stingy?
And should we call him Mr. Synge?

Or is it even more distingué
To speak of Mr. J. M. Synge?

To my mind it sounds light and springy,
Quite carelessly to call it Synge.

And then again the accents ring gay,
If we insist on Mr. Synge,

And yet our claim to truth may hinge
On simply saying J. M. Synge.

While certainly there's no denying,
It may be called correctly Synge.

I shake my head—and wonder dumbly
If haply "they" pronounce it Chumly!

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, \$3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

Mr. Roosevelt and Mr. Taft

MR. ROOSEVELT placed the management of his canvass, last week, in the hands of Senator Dixon, of Montana, and the Senator promptly gave to the public a statement, which had been approved at a conference with the candidate and several members of his campaign committee. In this statement he said:

"The lack of positive leadership during the past three years has turned a Republican majority of sixty in the House of Representatives into an adverse Democratic majority of seventy; has changed a two-thirds vote in the Senate into a bare political control of that body, and temporarily has lost control of a dozen Republican States of the North and West. The lack of leadership, of statesmanship, has produced a condition of business bewilderment which has halted the prosperity of the whole country. There can be no cure for this industrial stagnation unless we substitute a policy of progressive and constructive legislation which shall meet modern conditions with modern laws."

It is not true, of course, that lack of leadership "during the past three years" has made these changes in the House, the Senate and the State governments, for the changes took place at the elections in November, 1910, a year and a

quarter ago. They were due to the Republican party's revision of the tariff in 1909. With respect to that revision there was "positive leadership" in the Senate and the House, but it was leadership of a poor kind, being that of Mr. Aldrich and Mr. Payne. The President sought to improve their work. For his earnest attempts to improve it he should have some credit. At all events, he should not be held responsible, alone, for the tariff blunder which caused a political revolution at the polls. And the criticism is scarcely acceptable when it is offered by, or in the interest of, his predecessor, who made no effort in seven years to improve the tariff laws, and of whose opinions concerning the tariff the people of the United States up to the present time have no knowledge. We remember that on one occasion he did commend Mr. Taft's plan of revising by means of data procured by a board or commission.

In the same statement Mr. Dixon remarks that "the only hope left to those Republicans who are opposing the nomination of Colonel Roosevelt" (meaning the supporters of President Taft) is "to control, thru the prostitution of Federal patronage," the delegates from the South, together with delegates from some Eastern States where they "are named in conventions largely controlled by political bosses." The use of Federal patronage to control the selection and votes of delegates is to be deplored and condemned. Convincing proof that Mr. Taft is so using it has not yet been shown. But Mr. Dixon and Mr. Roosevelt must remember what was done in 1908, when Mr. Roosevelt was President. They have not forgotten, we presume, how delegates from the South were procured for Mr. Taft, and how effectively the "steam roller's" work was done at the convention.

We are confident that many true friends of Mr. Roosevelt do not regard with satisfaction and approval this first official utterance of his campaign manager, this attack upon the President, as to whose high character and exceptional qualifications Mr. Roosevelt has repeatedly spoken with force and eloquence.

We think the Republican party ought to nominate Mr. Taft for a second term. We regret that Mr. Roosevelt has set out

to prevent his nomination and to become the party's nominee in his place. We believe that Mr. Taft deserves the nomination. It has been the custom of the party to nominate its Presidents for a second term. Why should Mr. Taft be the first to suffer the humiliation of condemnation and exclusion? Mr. Roosevelt has given no reason. He has not said to the public that Mr. Taft is not now the man whom he described less than four years ago in the following words:

"I do not believe there can be found in the whole country a man so well fitted to be President. He is not only absolutely fearless, disinterested and upright, but he has the widest acquaintance with the nation's needs, without and within, and the broadest sympathies with all our citizens. He would be as emphatically a President of the plain people as Lincoln, and yet not Lincoln himself would be freer from the least taint of demagoguery."

In office, Mr. Taft has faithfully and earnestly supported the policies with which Mr. Roosevelt's name was associated. He has been and is a sane Progressive. Nothing more progressive has been proposed by a President in many years than his peace treaties and his urgent recommendation that all the highest offices in the postal and customs and internal revenue services be taken out of politics and made subject to the merit rules. These are the offices which he is now accused of using improperly in his own interest. He is progressive with respect to conservation, reciprocity, publicity for campaign contributions, economy and efficiency. He stands now for a downward revision of the tariff, the measure of it to be determined by data procured by a competent board. He would exclude logrolling and bargaining from tariff revision. He is a better Progressive than Mr. Roosevelt, for the latter, we believe, as an advocate of the recall of court decisions, is a reactionary. We have some testimony about Mr. Taft as "the true friend of reform" in a letter written three and a half years ago by Mr. Roosevelt, who then said:

"To permit the direction of our public affairs to fall alternately into the hands of revolutionaries and reactionaries, of the extreme radicals of unrest and of the bigoted conservatives who recognize no wrongs to remedy, would merely mean that the nation had em-

barked on a feverish course of violent oscillation which would be fraught with great temporary trouble, and would produce no adequate good in the end.

"The true friend of reform, the true foe to abuses, is the man who steadily perseveres in righting wrongs, in warring against abuses, but whose character and training are such that he never promises what he cannot perform, that he always a little more than makes good what he does promise, and that, while steadily advancing, he never permits himself to be led into foolish excesses which would damage the very cause he champions.

"In Mr. Taft we have a man who combines all of these qualities to a degree which no other man in our public life since the Civil War has surpassed."

If this correctly describes and characterizes Mr. Taft, why should Mr. Roosevelt desire to displace him, and why should any Progressive desire to oust him from office for Mr. Roosevelt's benefit?

For several reasons Mr. Roosevelt ought not to be nominated. First, because Mr. Taft deserves a renomination and should not be humiliated by rejection. Again, the party would make itself ridiculous by rejecting the President, thus branding him as unworthy or incompetent, and by selecting in his place a candidate the most prominent plank in whose platform at present is the recall of court decisions by a majority vote at the polls. In addition, Mr. Roosevelt, as the nominee, would be weighed down by the objection to a third term and by the belief of a very large number of Americans that in accepting a nomination he had broken his word. Can the party afford to commend in its platform its executive and legislative work of four years, and to withhold a renomination from the President so closely associated with that work and responsible for a large part of it?

Mr. Roosevelt and his party, if he should be the nominee, would have heavy burdens to carry, and not the least of these would be his treatment of Mr. Taft, his friend. The ex-President has been accustomed to extol the virtues of "the square deal." If he should wrest the nomination from the President, would he be able to say that a square deal had been given to Mr. Taft by himself? Can he say now that even in his preliminary canvass there has been a

square deal for either Mr. Taft or Mr. La Follette? Does he relish the frequently published assertion that he has stabbed his old friend in the back to satisfy his own ambition? The third term objection, the promise given in 1904, the recall of court decisions and a divided party would be heavy weights, but widespread disapproval of Mr. Roosevelt's treatment of Mr. Taft might be as great a burden as any of these. The American people like fair play.

Free Sugar and an Income Tax

THE bills presented to the House of Representatives by Mr. Underwood, giving free sugar and an income tax are not bad politics. They are meant for politics, for they are not expected to pass the Senate and be signed by the President. They are meant for use before the people, when the Democratic orators will say, We offered you free sugar, a necessity of food in every poorest family, and they refused it. They do not care for the poor people; they are concerned only for the big corporation magnates, for the very ones who have been robbing on both sides, putting heavy burdens on the people, and then turning around and robbing the government by fraud in the customs. We have been expecting the Democrats to make some stupendous blunder, as they usually do; but thus far not even Mr. Bryan, in his attacks on other Democrats, has succeeded in doing them or his party much harm, not a fraction of the harm which dissensions are doing in the Republican party.

It is good Democratic politics, because the asserted reduction of the cost of living will be made the most of. To be sure it is not much, a cent and half a pound at the most, much less than most people waste on candy; but put it in the bulk, as so many millions, and it will bulk large. Here comes in the bad tactics of the Republican administration. It should have been a prime business of the party to make it clear, by a commission or otherwise, to the common people what are the reasons for the increase in the cost of living. It would then have been

shown that the tariff, or any other legislation, or any trusts, have but a minor part in raising the price of all commodities. The main cause is the enormous production of gold, which is the standard of value. But the unparalleled output of gold of late years has cheapened gold—that is, when one wants to buy with it a bushel of wheat, it will not buy as much wheat; or to reverse the order of terms, it has raised the value of wheat, so that you must pay more gold for a bushel of it. But our people who are not informed on the subject, and are told that this, that and the other thing has caused the increased cost of living, will be much pleased at this legislative act to relieve the burden, when it is a relief they never will feel, since the cause of high prices lies much beyond Congress. It is in Alaska and Australia and South Africa.

Then the proposition to make up the loss of revenue from the poor man's sugar by putting the tax on the rich men is also good Democratic politics, for it is really an income tax, and an income tax is as fair a tax, when fairly imposed, as there is. It is a question, to be sure, whether Mr. Underwood's bill does impose the tax fairly. It skips the poor man, and that is popular; but we see no reason why a poor man should not pay his share of the tax, if his share is not so small as not to be worth collecting. The bill exempts incomes not over \$5,000; but why should not incomes of four or three or two thousand dollars pay their fair tax? There is no good reason, unless it be that the exemption of the smaller incomes is good politics.

It is none the less good politics, because the Democratic leaders cannot expect it to pass the Republican Senate, and that will be charged against the Republican party. It can hardly pass the Senate, because it is an attempt to get around the decision of the Supreme Court that an income law is unconstitutional. • Mr. Underwood proposes to get around this decision by calling every man's work a "business," inasmuch as the Supreme Court decided that to tax the business of corporations is constitutional. So the bill simply extends the corporation law and calls the employment of the teacher, the clergyman, the

lawyer; the artist, a business, as well as that of every partnership. - Thus sixty million dollars is to be received to make up for the fifty millions lost on sugar. It is a fair way of taxation, but we do not see that it fairly escapes the reasons for the adverse decision of the Supreme Court. An amendment is now before the States to allow the income tax, and we should wait to see if it can be approved, rather than to sneak in even a good measure by indirection. Never-

William Dean Howells

For a half century—good measure and now spilling over into a second half—William Dean Howells has been a foremost figure in our national literature. Coming home from Venice shortly after our Civil War, he left his name and his exquisitely beautiful handwriting as a record of his work for his great continental republic, done in a republic of a different sort that had controlled the

WILLIAM DEAN HOWELLS AT SEVENTY-FIVE

theless, the decision was by a divided court, and it might be that, if the bill should pass the Senate and the President, the Supreme Court might now allow it to be valid.

We commend the astuteness of the Democratic leaders and they have given the Republican leaders a stiff task to meet. The two bills are in essence reasonable and popular, but they will have a hard road to travel; and whether enacted or not they will give the Republican party also a hard road to travel.

commercial world for four hundred years. One of the briefest yet saddest letters copied in the consular books was that telling the sorrow felt in his own heart for the murder of his great chief, Lincoln, at Washington.

His own official career was soon ended, and his dearer relation to American life begun. As "traveler and novelist," as he has described himself, he came home, and from that day on his true life has grown of continental importance. No American can visit Italy without

feeling a just pride in the record of our wisest and most observant sightseer displayed in every bookshop and on every hotel table. It has become the guide, philosopher and friend of every scholarly traveler. As a keen-eyed, fair and fearless observer he has laid before us what he saw and knew, not what he fancied he saw and guessed he knew. Weaknesses he has touched tenderly, almost as if he loved them; vices he has handled without gloves. Many a middle age pretty romance floats away from Venice past the Lido, and will never return, but many a homely virtue has come to stand firmly on that shaky foundation of Venetian mud and granite, and the island city is the lovelier for it.

But he came home to his wider usefulness as guide, altruistic philosopher and friend to the bottom millions, and his name there also is an international asset. Trained in the West as a journalist, with a side glance in his happiest moments into the field of verse, where his sweetest and our sweetest blossoms may be found by those who are willing to listen to the undertone of "still, sad music of humanity" that continually stirs those blossoms, he entered with swift feet upon that wonderful race which was to be his in the end. He earned a doctorate in various journalistic offices, whether he got it or not then from the universities. He perfected himself to that finest radiance in the pure English style of writing, and later, when the universities began looking his way, they took off their smoked glasses, gave him the honors, and would gladly have promoted him to the chair of English undefiled had he seen a clear light in that direction.

Taking such rewards as lay in his way, and declining others that beckoned him away from his chosen path, he went still further east and sat in the editorial chair of the *Atlantic*, and in Cambridge and Boston won choice friendships which he has made notable in one of the best books ever written, commemorative of delightful evenings at delightful firesides. Meanwhile he was making the unhandsome detail, the homespun of daily life in New England, New York and the West stand out in contrast with the unmoral yet fashionable tinsel of an ambitious society. For along with the

touch that was graceful and healing he had perfected the surgical touch which has since led him away from the poetry of American simple life to the pathos of it, to the haunts of pain, sorrow and the canker that may eat its way into the heart of the Beautiful Republic.

Traveler and novelist he has been ever since—keen-eyed traveler, sometimes sad-eyed novelist, but always in both traveling toward that goal, as he sees it, of highest, helpfulest friend of humanity, that good physician who smiles at the milder follies of the race, but lays bare to the knife the succulent sources of evil. His has been the best that a good heart may earn, the gladdest reward that persistent honesty may claim. Many have long since passed him in the race as "best sellers," but none can look back from a loftier height on a more shining fame than will, in our judgment, be his. Not yet is it time to think of sunset for him. Not yet

"The clouds that gather round the setting sun
Do take a sober coloring from an eye
That hath kept watch o'er man's mortality."

Rather let it be that future years may sing:

"Another race hath been, and other palms are
won."

A Literary Dearth

OF the career and achievements of our most beloved author and editor, Mr. Howells, we have spoken in the previous editorial. But such an occasion as the great banquet given him by Colonel Harvey has its general no less than its personal uses. It offers opportunity to estimate our civilization, because there is no more trustworthy index of progress than productiveness in the fields of literature and art, including in art those social amenities which are among the finest achievements of the intellectual life.

Looked at in this large and detached way, the Howells dinner was in a measure disappointing. In the list of guests were names of men and women who have given forth ideas, but the number of such was not large, and there was a curious absence of writers who have deeply influenced American thought. An extraordinary proportion of the list consisted of names associated with light

and ephemeral work, pleasing but unimportant stories, trifling verse, magazine "specialties" and good newspaper reporting.

The interpretation of such a guest list is obviously not a suitable subject for criticism. The dinner was given by a popular magazine to one of its staff, and that fact would naturally limit the selection of names, which is no more to be questioned by the public than are the grounds upon which we choose our associates or the friends that we invite to our houses. It is, however, in order to inquire how far the composition of the guest list for a tribute to an eminent man reveals either the actual intellectual productivity of the community or the recognition which intellectual productivity receives.

It is the answer to these questions which the Howells dinner (perhaps quite unconsciously) offered that is undeniably disappointing. If the Englishman or the Frenchman a hundred years from now who happens to be curious about the intellectual life of America in 1912 shall chance upon a list of the Howells dinner guests and shall be able to obtain samples of the authorship which the list represented, and if beyond these data he can get no information, he will necessarily conclude that America had ceased to produce or had not yet begun to produce a literature rich in ideas. He will ask if our vigorous individualistic life had produced no historians, no philosophers, no great names in natural science, no publicists able to clothe their serious thought upon the problems of government and social organization in a form sufficiently attractive to be called literature. He will ask whether the American people really had no such writers or whether they may have existed and been unknown, not only to the masses, but even to the recognized literary set.

Which of these possible explanations is the true one? Have we no serious writers now whose work is worthy to be called literature, or are the American people so incapable of being interested in ideas that serious writers get no hearing and practically are never read? Have we strong and admirable writers

whose very names are unknown among the magazinists and producers of "best sellers" who pass for literary folk in a society which cares for nothing more substantial than pleasantly phrased trifles and gossip talk, from which anything so heavy as a vigorous bit of discussion, a contribution to scholarship or a careful essay in constructive criticism must be expurgated?

We find it easier to ask these questions than to answer them.

Public Speaking in Colleges

IT often falls to the lot of the editor of THE INDEPENDENT in his multiple personalities to visit universities and colleges in various parts of the United States, and in so doing he cannot refrain from making comparisons and drawing from them conclusions which seem to his own mind to have a certain validity, altho he realizes that they are easily disputed and impossible to prove. One such conclusion is that, as a rule, there is a great deal more interest taken by the students in public speaking in the Western institutions than in the Eastern, and in the smaller institutions than in the larger. We have in mind, tho we do not adduce it as evidence in support of our view, a debate we recently attended between two of the leading literary societies of two of the largest universities of the East, the Zelosophic of the University of Pennsylvania and the Barnard, Columbia University, at which there was an audience of a dozen, not the traditional baker's dozen, but the ordinary modern American baker's dozen, that is each debater had two auditors if they had divided them up. At the regular triangular league debate between these two universities, held at Columbia the following week, there was naturally a better attendance; as near as we could estimate about one-half of one per cent. of the student body at Columbia turned out to hear it. About the same time we attended a State oratorical contest at Indianapolis and found the largest hall of the capital packed with enthusiastic students, some of them coming long distances at considerable sacrifice, and the boxes occupied by the prominent men of

the State, among them Senator Beveridge, who won his spurs in such a contest not very many years ago. We happened to be in Beloit when the news came that the representative of that college had won the interstate competition, and the whole town went wild, with ringing the bells and building bonfires, with singing of songs, yelling of yells and making speeches, just such a general jubilation as we have often seen in the East over a football victory, but never for a triumph of an intellectual character.

One reason for the greater popularity of speaking contests in the West is because there they served as the chief outlet for college patriotism long before athletics came into the field. Competitive oratory had been for years the chief occasion of intercollegiate meets in Western States, while football was there known only by name. Many of the Western men now prominent in national politics were trained in these contests, which indeed may truly be called the beginning of their public careers, for the winner of a State or an interstate oratorical contest achieved more than an academic renown. He was already looked upon by the public as "a coming man," just as in England a successful debater in the Oxford Union is regarded as "earmarked" for Parliament.

Later the tidal wave of athleticism swept over the United States from East to West, and became the dominant interest everywhere. At the same time intercollegiate debating was introduced in Eastern institutions, where, however, it never has risen above the rank of a minor sport. The Western universities also adopted the debating system to some extent, but it has not altogether displaced the old-fashioned oratorical contest. It is not desirable that it should, for both forms of public speaking have their peculiar faults and virtues. The debate provides a training in quick-wittedness and team play and command of material. On the other hand, the debater may come to put too high a value upon sharp tactics and may learn the dangerous lesson that it is as easy for a man to talk on the wrong side as on the right. In delivering a formal oration there is not the same excuse for insin-

cerity, since each speaker can choose his own subject and side. He can present his appeal in an orderly and complete manner and adorn it with sentiment and poetry to his taste. His danger is that for lack of adverse criticism he may conceal vacuity of thought and defects of reasoning by the flowers of rhetoric. The debate is practically confined to current political questions. The intercollegiate oration has a wider range and deals often with classical, biographical, literary and religious themes. The debate affords the best training for the bar, the oration for the pulpit. If some future historian should construct his theory of American education upon a collection of the programs of intercollegiate contests East and West he would be apt to come to the conclusion that the Western colleges were founded for the purpose of training men in classical and literary lines under religious auspices, while the Eastern colleges were secular and utilitarian, and devoted chiefly to finance and politics.

The British Bacchæ

THOSE modern mænads who are just now infesting London are hardly less mad than those who tore Orpheus to pieces:

'When by the rout that made the hideous roar
His gory visage down the stream was sent,
Down the swift Hebrus to the Lesbian shore.'

They have the same lawless passion which was then inspired by the Bacchic rites, when men were excluded from their wild dances at the peril of life; only these bacchæ who follow Mrs. Pankhurst are crying for the fellowship of men in all political service. They are so determined on it that they will buffet the men and smash their shops, and pray to be arrested and imprisoned.

They want to call attention to their wrongs. That is all right. Let them do it in a decent, respectable, civilized, not to say ladylike, way. They want to get rights by doing wrongs. Those shopkeepers in Piccadilly have done them no wrong that they should go with hammers and stones and destroy twenty-five thousand dollars' worth of plate glass. Prime Minister Asquith does not

believe in woman's suffrage, and he has the right to his wrong opinion; but that is no reason for assaulting his house. He is not likely to be made amenable by such arguments. The other evening, Mr. Lloyd-George tried to make a speech in favor of woman suffrage and their hideous rout howled him down, a performance which gave no evidence of fitness for the ballot. Their whole campaign is disgusting and absurd.

Suddenly, without suspicion by the police of their intention, the conspirators, worthy of Kipling's description of the sex, descended on Mr. Asquith's house and on the most fashionable shops in London and smashed the windows as far and fast as they could until arrested. Mrs. Pankhurst, who lately visited us, was the leader, and gained the title of martyr she madly wanted by being sent to prison for hard labor for two months, and dozens of others were similarly punished. This time the magistrates showed no leniency. Why should they? Why should rich, well-dressed women be treated with more mercy than a slatternly harridan who disturbs the peace? She should rather be punished more severely. She puts herself in their class. We trust that her apostalate to this country found no converts to her program. The way our women take here to gain their rights will work in England also, given time to educate the women as well as the men. This way never will.

They defend themselves by saying that the coal miners are taking a similar way, and that Mr. Asquith and all the Cabinet hasten to try to help their cause, while they are neglected. In the first place, they are not neglected. A bill to emancipate women will be introduced in Parliament and members of the Cabinet will support it. That is the legitimate way. In the next place, the miners are not smashing windows; they have simply stopped work, as they had the right to. Let the militant suffragets do the same. If not allowed to vote, let them refuse to attend to public service. Let them refuse to pay taxes. That was the legal and peaceable way that the Free Churchmen were doing a few years ago. That would be a public protest that would receive attention.

We fully accept the cause for which these British bacchæ plead, but we are tempted, when the ballot is given to women, to desire a provision which shall exclude from the ballot all those who have been imprisoned for violence against the law.

Heading Southward

THE recent celebration at Key West commemorates a marked stage in the development of internal improvement, hardly excelled by that which noted the completion of the first continental railroad or the interoceanic telegraph. This work was carried on so quietly, and behind the shield of other enterprises, and most of it in one corner of the country, that it called for less notoriety and applause during its progress. It has been almost entirely the work of one man, altho he has kept a small army of laborers constantly at work since 1886—a complete quarter of a century.

We do not know what Mr. Henry M. Flagler intended to do at the outset, any more than we know what he proposes at present. He talked little about his plans and applied for aid to no legislative body. It was in the year we have just mentioned, 1886, that he bought the franchise of a railroad, which was to have been built with one end at Jacksonville and the other somewhere about the Indian River—which is a branch of the sea, heading north and south along the coast of Florida. In just ten years this road was made to extend all along down the river, or coast, to Miami. Miami lies just off the Everglades, which covers the whole of the peninsula for over two degrees of latitude, except here and there a stingy bit of coast line.

The country opened by this new road lay exactly as it did when the Europeans first discovered the country; it was the work of the road to string the most romantic series of towns, along this marvelous coast, and make them the winter homes of the Northern tourists. It began a new history in the evolution of American vacations. Heretofore the Northerner had found his month off in the Adirondacks or Northern Michigan; he began now to turn southward to escape zero and la grippe. The east

coast of Florida was transformed from a wilderness to a realm of beauty unsurpassed since the days of Bagdad and the Caliphs. Magnificent hotels were planted here and there, especially at St. Augustine, Palm Beach and Miami, and these were filled almost as soon as built.

But Mr. Flagler was not satisfied; his disposition is never to be content with the achieved. He found new territories to conquer. From Miami the railroad was stretched down the coast, resting mostly upon the Keys that constitute a thousand islands, and bend westward around the tip of the State into the Gulf of Mexico. On and on, the road was made to creep, from island to island, and key to key, until at last it reached Key West. Steamship service was provided in 1896, from Palm Beach to Nassau, and then the port was changed to Miami, in order that the tourist might enjoy an ocean trip as well as gorgeous hotels and equally sumptuous railroad trains.

Jefferson told us that Cuba fairly belonged to the United States, and politically it should be assumed as our property, or a part of the Republic. He called it the key of the Gulf, an essential to our political safety. Mr. Flagler proposed to make it such by railroad connection. Something never dreamed of before, he carries this railroad, mainly by water, on to Havana, and Cuba shall be physically a part of Florida. De Lesseps never dreamed more grandly, nor did he achieve as surely. Mr. Flagler began as a poor lad, and from first to last he has never established a habit of calling loudly for some one to help. The whole work so far has been the achievement of business genius. He has known how to accumulate wealth, and he has known equally well how to use it for the general good. He has consecrated it, by a series of homes all the way from Jacksonville down the coast, thru the wilderness, over the swamps, everywhere transforming everything, and now he looks over from Key West to Havana.

Naturally, just at this point our State Department understands that Cuba must not be given over to its old fashioned lawlessness. By treaty arrangement it is under the paternal care and brotherly oversight of the United States. Mr.

Flagler will do for it what armies could not do. Over one hundred Congressmen and others, representing all departments of the Government, were at Key West to express their appreciation of the vastness of the work achieved by individual genius. Their presence, we imagine, does not mean that the United States will be now invited to wind up the work, or help to build the last link in this railroad across the sea. The idea belonged to one man; the achievement so far has been purely individual, and we presume it will be such to the end.

All in all we see brought toward its completion one of the noblest of modern enterprises. It involves more of the novel, and of that which was supposed to be impossible, than even the Panama Canal, and it is not sure that, in the end, it will not offer as large beneficence to human kind. We shall now hear the announcement, From Boston to Havana in less than three days; from zero, thru the orange orchards, and into the pineapple gardens, without change of cars. Cuba and Cape Cod will be linked with a tie stronger than treaty bonds or legislative enactments.

But this drift southward means more than is superficially seen. It is more than a tourist's tale, or the second search for the fountain of perennial youth; it involves commercial changes of vast proportions, and a social evolution, involving political, that looks toward the rebirth of South America, while it co-operates with the curve of navigation that will pass thru the Panama Canal. New York City will soon be a port of the Pacific.

The American Bar Association It is a strange thing if a colored man cannot be made a member of the American Bar Association. The case is that of Assistant Attorney-General William H. Lewis, whom Attorney-General Wickersham nominated for membership. He was elected a member by the executive committee, but when the membership committee came to make up the annual catalog they noticed that he was a colored man, and they canceled the election. Now Mr. Wickersham has issued a protest to the members, and the

matter will be decided at the annual meeting. The reason given for canceling his election is race prejudice, and the fact that there is an annual social meeting at which members can bring their wives, who might find a colored woman present. Mr. Lewis is a graduate of Amherst College and the Harvard Law School, and was a famous athlete before he became a successful lawyer. He is seven-eighths white. We fail to see what social prejudice has to do with his right to membership in an organization whose business is to advance the science of jurisprudence and the administration of justice. This action of the membership committee is a clear injustice, something that they had no right to do, and is properly characterized by Attorney-General Wickersham as an outrage. It is something that women not members have nothing to do with. For peace sake he could, as has been suggested, withdraw his application if there were not a principle involved.

"Bigger Than Old Grant" The other day Cardinal O'Connell, of Boston, visited his native city of Lowell, and his official paper, owned by him, gives the better part of two broad pages to pictures and a fulsome account of the reception there of Lowell's "first citizen." It is a flagrant illustration of the evil which non-official Catholic journals have begun to condemn ever since the editor of that journal declared that none but official journals could properly be called Catholic. In the same issue the Cardinal prints under the head "Official" a notice "To the Reverend Clergy," telling them that no official business must be directed to him, but to his chancellor or secretary; and that no lay person will be heard in any chancery business. He adds that he is so busy that he has no time to receive personal calls, and that only very rarely should any personal visit on business be made. He explains:

"I feel it my duty to say that disregard of this plain statement would indicate lack of consideration for those whose whole time must be given to the care and responsibility of the great work of the archdiocese."

We have not observed that any President of the United States has ever hedged himself in with such elaborate dignity.

A Call for Archimedes

Over a million workmen in the British coal mines are on strike, and 40,000 more men in six hundred mills will be thrown out of work this week, with others to follow if no settlement is speedily made, either by agreement or by legislation fixing a minimum wage. Then this is the time for our physicists to get themselves busy. In a hundred years or two the mines of coal will be exhausted, and we shall have to depend on some other source of supply. Why cannot the students of physics hurry up a little and do what they must do in a century or so? Did not Archimedes set fire to the Roman ships that besieged Syracuse, utilizing no source but the sun's heat? Why should we be dependent on coal when we have the same supply inexhaustible for a million years? Our inventors have been more or less mulling over the problem for years; we need a modern Archimedes to solve it.

Beyond all question, by an official Japanese statement, over a hundred persons in Northern Korea have been arrested by the Japanese authorities charged with a conspiracy to murder General Terauchi, Governor of Korea, and teachers and students in the Presbyterian Sin-Syong Academy are charged with being the leaders, and most of those arrested call themselves Christians. No missionaries have been arrested. It is said that those arrested have confest. The statement adds:

"The arrest had nothing to do with the Church or their faith. In spite of this plain fact some of the missionaries affected by this affair are reported to have disseminated various hypotheses calculated to protect their own interests."

Therefore Governor Terauchi met a leading missionary of the Presbyterian mission and explained to him the facts. It is very unfortunate, but it is not strange that conspirators should have imagined that a cloak of religion might protect them.

Oxford and Cambridge universities are still forbidden to give degrees in theology to Nonconformists or to give a professorship in divinity to any but a clergyman of the Church of England. There is now a movement to remove this

antiquated disability. In this country a soundly Protestant college has given the degree of Doctor of Divinity to a Catholic graduate.

Our older readers will see in the swift logic of the Chinese revolutionists a parallel to American experience in the Civil War. We take from *The Chinese Records* this story:

"In a church in Shanghai a meeting was called, and circulars were sent round soliciting subscriptions in aid of the revolutionary army. The foreign pastor reasoned with the church leaders and suggested to them that whatever individual preferences we had as a church, we ought to maintain a neutral attitude. He suggested that the funds raised should be given to the Red Cross work by which both sides would be benefited and that in our prayers we should seek God's pity on both parties alike. One church member rose and said, 'This war is God's way of delivering us from all the disabilities we labor under during the rule of the Manchus. Moses delivered the Israelites from Egypt and I do not think the Bible records that they were ever asked to pray for Pharaoh.'"

We ventured to comment on Colonel Watterson's reporting the private interview in which he was present with Governor Wilson and Colonel Harvey, as the result of which the Governor's name was taken down from *Harper's Weekly* as Presidential candidate; and we quoted a line from Spenser about the "blabbing tongue." Now the *State*, published in the capital of South Carolina, quotes us, and calls on Colonel Harvey to come to Watterson's defense, as it was at Harvey's desire and request that Watterson reported to the public. Then let Colonel Watterson print Colonel Harvey's letter to that effect. An old rat does not walk into a trap.

A Montreal court has decided that a marriage between two Catholics by a Protestant minister is valid. That is right, valid in civil law. But the Church authorities declared it invalid. That is right by ecclesiastical law. The two may properly differ. They often have. The State will hold them lawfully wedded and will treat their children as legitimate; the Church will declare them unmarried, and will forbid them the sacraments. The two authorities do not collide; they move on different levels, like an eagle in the sky and a dove near the

ground. It is a question of wisdom between them, but neither needs to yield.

For a little while the present elected President of the Chinese Republic, Yuan Shih-kai, has lost control of his vaunted troops and again it has been necessary to call in foreign soldiers to hold the mutinous unpaid, looting and murdering Chinese soldiers in check. His army is less in hand than that of the south, and it may be that not only is Yuan Shih-kai's position in danger, but there may be peril for the new republic itself. But thus far the foreign nations are showing a right spirit in allowing China to work out her own mighty problem.

It is a pleasant relief from much sartorial flummery to know that the senior class of young ladies in Smith College have voted by an overwhelming majority to have nothing to do with tasseled quatre-cornered caps and black gowns, but will graduate in white dresses with roses. President Seelye was inflexibly opposed to special academic dress which should imitate the display of the vainer sex.

From London it is reported that Mr. Hammerstein is reducing the cost of opera tickets to that of theatrical performances, while a New York theatrical manager has reduced the cost of tickets to all his productions by 25 per cent., and says he makes larger profits in consequence. Yet the increased cost of living is complained of! "The people have no bread?" said Marie Antoinette. "Why don't they eat cake, then?"

There are harrowing reports of the extensive famine in China, and contributions are earnestly sought. There are various channels by which money can be sent, such as the Red Cross, Washington, or any one of our missionary societies having missions in China. Here is a good way to show sympathy for the young republic.

A new national school established in Colombia includes a two-hour course in good manners. Possibly international good manners may be included, such as the speedy reply to a request for arbitration.

Insurance

Our Fire Loss

THE committee on statistics and origin of fires of the National Board of Fire Underwriters reports that during the year 1910 there was a per capita loss from fire of \$2.33 for the entire country. During that year there were thirty conflagrations in each one of which the loss was over half a million dollars. The

	Per Capita Loss.
United States	\$2.39
England44
France92
Germany19
Ireland45
Norway25

The European countries endeavor by means of proper building construction to reduce the danger from fire. In

total loss from these large fires was somewhat over \$22,500,000. Since 1866 the loss from large conflagrations of this nature has been over a billion dollars.

If the extent of the loss in the United States was approximately the same as that in European countries we might become reconciled to its magnitude. Note, however, the per capita loss thru fire in European cities, as compared with that in 297 cities in the United States having a population of over 20,000 in 1910:

American cities we seem to have paid much less attention to proper construction and more to the development of apparatus and means for fighting fire. The result is that in provision for fighting fires we lead the world. It has been due only to good luck and the heroism of the members of our fire departments that more serious conflagrations have been avoided in our American cities. The European is superior to the American method of meeting this problem.

Securities and Business

SALES on the New York Stock Exchange last week amounted to 1,772,460 shares. In the week preceding they had been less than 1,000,000 shares. In corresponding weeks, one, two and three years ago, the totals were from 2,500,000 to 3,000,000. Trading in stocks was marked by great dullness in February, the daily average having been about 310,000 shares and the total the smallest for a February since 1897. Last week's transactions showed a small net gain. Sales of Reading, Union Pacific and Steel were 42 per cent. of the week's business, and the gains for these stocks were 1, 3, and $2\frac{5}{8}$, respectively. The Republic Iron and Steel Company passed the quarterly dividend on its preferred shares. It is operating at approximately 90 per cent. of its capacity, but prices are low and profits small. In the last half of 1911, its net profits were only \$798,772, against \$1,267,855 in the corresponding months of 1910. In connection with these figures for the Republic may be considered the recent reports of several other independent companies in the steel industry. The Lackawanna Steel Company's net income for 1911 was only \$2,450,000, against \$4,963,000 in 1910. The Cambria Company's net earnings were reduced from \$5,200,000, in 1910, to \$3,492,000 in 1911, and the gross receipts of the Pressed Steel Car Company were cut down from \$28,000,000 to \$11,331,000, with a surplus for the year of only \$17,000, against nearly \$700,000 for the year preceding. The Republic Company took the initiative, last May, in reducing prices and making a canvass for orders. Its reductions were met by other companies, and all of them have been doing business on a small margin of profit. The steel car trade has been affected by the economical policy of the railroad companies, adopted after permission to increase rates was withheld. Dullness in stock market operations has been due to the political situation, preparations at Washington for an investigation concerning a so-called Money Trust, the coal strike in England,

the menace of a coal strike here, and the threatening situation in Mexico.

Reports about the condition of general business and trade are encouraging, altho the movement is a highly conservative one. Retail stocks are low. There is a steady demand, but purchases are made with caution. The undertone is healthy, but there is a tendency to await developments in national politics and tariff legislation. This is a Presidential election year, and the issues are those which to some extent may directly affect manufactures and prices. Business rests upon a sound foundation, but probably will be conducted under some restraint of caution thruout nearly the entire year.

....In the Canadian northwestern Province of Alberta, \$2,000,000 will be spent this year for telephone construction, the work including 3,000 miles of rural lines, 500 miles of long distance lines over new routes, and several new town exchanges.

....Twenty-five years ago, our imports of eggs exceeded 16,000,000 dozen annually, while our exports were only 250,000 dozen. But the course of international trade in eggs has since been reversed. Last year the exports were 13,250,000 dozen, and the imports less than 1,000,000 dozen.

....The holdings of Steel Corporation common stock in foreign countries amount to \$114,840,800, or $22\frac{1}{2}$ per cent. of the total. To this may be added \$29,241,500 of the preferred stock. Thirty-seven countries are represented, but 90 per cent. of the total is owned in England and Holland.

....A large body of anthracite coal has been discovered at the head of White River, in Yukon Territory, Canadian Alaska, and within 60 miles of copper mines and a railroad on the American side of the line. Coal lands in Canadian Alaska are leased by the Government for twenty-one years at an annual rental of \$1 per acre, with a royalty of 5 cents a ton on the output.

No. 3302

Survey of the World

The Republican Situation

Addressing the students of Princeton University on March 8

Senator Lodge denounced the initiative, referendum and recall as obsolete, impracticable devices, subversive of the fundamental ideas of representative government. The Massachusetts Senator held that "a majority of the voters are not necessarily the people, and do not at all times represent the real wishes of the people," since the majority may be a narrow one or ephemeral. The trial made of the referendum showed, he said, that a large proportion of the electorate refuse to pass upon questions submitted. In combating the innovation Mr. Lodge quoted Governor Wilson's book on "Constitutional Government," published in 1908. (The day before, Governor Wilson told the members of the Maryland Legislature that the demand for the initiative, referendum and recall comes from the people "because they do not feel that they control the methods of legislation." He favored provisions for the recall of administrative officials, but not the recall of judges.) Mr. Lodge argued at Princeton that "the more elections are multiplied and the more elaborate the machinery for selecting and electing candidates, the larger the field for professional politicians and for the employment of money to control election results." He cited the return of Isaac Stephenson to the United States Senate from Wisconsin, a State where the primary system is in full operation. Some of Senator Lodge's ideas were phrased, with different emphasis, in the President's Toledo address, delivered the same day. Thus the proposal to recall judicial decisions by a popular vote, "a remarkable suggestion," is, said Mr. Taft,

"so contrary to anything in government hitherto proposed that it is hard to give it the serious consideration which it deserves because of its advocates and the conditions under which it is advanced."

Only by inference did the President refer to Mr. Roosevelt, but he said the Roosevelt program

"lays the ax at the foot of the tree of well-ordered freedom and subjects the guaranties of life, liberty and property without remedy to the fitful impulse of a temporary majority."

Mr. Taft welcomed the progress made and making toward "securing greater equality of opportunity," and destroying the undue advantage of special privilege and accumulated capital, but urged that human progress be advanced without recourse to "feverish, uncertain and unstable" votes upon judicial decisions.

"Such a proposal is without merit or utility and instead of being progressive is reactionary; instead of being in the interest of all the people and of the stability of popular government is sowing the seeds of confusion and tyranny."

Defects in our judicial system are due, not to the corruption of judges, but to faulty procedure, and the difficulties judges have in aiding juries to reach just decisions. Corrupt judges may be impeached, and, if the apparatus for impeachment be too cumbersome, let it be simplified. On March 9 the President made six speeches in Chicago. "Progressive is as progressive does," he declared. Mr. Taft referred to the distorted versions of his Lincoln Day address circulated by his enemies and said: "We all believe in popular government." However, in suggesting that mistakes might be made thru hasty action, he supposed he laid himself open to the criticism of those who "constantly fawn upon the people as if they were incapable of error." The American people, in draw-

ing up its Constitution, "recognized the danger of hasty action by themselves, and . . . voluntarily maintained a protection against it."—President Taft and his administration were defended against political criticism at Chicago by the Secretary of War, on March 5. Mr. Stimson praised the President for faithfully carrying out "the Progressive faith of the Republican party." Referring to the fact that he had entered public life "under the inspiration of Theodore Roosevelt," Secretary Stimson expressed his belief

"that those who are forcing him, contrary to his original intention, into the arena against Mr. Taft are jeopardizing instead of helping the real cause of Progress."

Mr. Roosevelt seemed not a little disturbed by Mr. Stimson's speech, which contrasted Mr. Taft's methods with his to Mr. Taft's advantage, and which made a favorable impression. Mr. Roosevelt disclaimed any wish to exact gratitude, but declared that the party leaders supporting Mr. Taft for renomination were

"managing the campaign against me; and if they were deliberately trying to wreck the Republican party they would follow precisely the tactics they have been following."

The activity of Federal officeholders in the President's behalf is complained of by Mr. Roosevelt and his campaign manager, who challenge the Taft forces "to support real primary bills," and to come out for "preferential Presidential primaries." The reply of Representative McKinley is that the plan suggested amounts to "the recall of conventions." Properly conducted primaries he favors on general principles; but

"all but seven States have already made provision for holding primaries and conventions."

Mr. McKinley does not favor "changes in the rules of the game while the game is in progress." This phraseology shocks Mr. Roosevelt and Senator Dixon.

The Arbitration Treaties The Senate, by a vote of 42 to 40, eliminated from the pending arbitration treaties with France and England the vital paragraph relating to the joint high commission, and otherwise limited the application of the treaties. It is a question whether the mutilated treaties will now

be submitted for ratification by the Powers named. Negotiations for similar treaties with Germany, Japan, Switzerland, etc., will now be abandoned by the Administration. The failure to pass the treaties as amended by Senator Lodge's resolutions is laid at the door of the Democratic Senators, supported by several Roosevelt Republicans, notably the Roosevelt campaign manager (Dixon, of Montana), and Lorimer, of Illinois. The treaties in their emasculated form were passed with three dissenting votes: Lorimer (Rep.), Martine, of New Jersey, and Reed, of Missouri (Democrats). We discuss this subject editorially.—Senator Dixon denies having sent the following telegram to Mr. Roosevelt after action was taken on the treaties:

"The Senate has ratified your contention in regard to the treaties. Our Democratic friends have come to our rescue."

This telegram, published in the *Washington Post*, is branded by the Montana Senator as an "evidently premeditated forgery." Mr. Roosevelt exclaimed to interviewers who asked him his opinion of the action of the Senate: "No, no. I will not comment on it." Mr. Taft said: "We will have to begin all over again. I am not discouraged, only disappointed." Another disappointment was the action of the Senate in holding up its confirmation of Mahlon Pitney, of New Jersey, as the successor to the late Associate Justice Harlan, of the Supreme Court. This action followed its confirmation of Chancellor Pitney, and was based upon opposition to the nominee on the ground that his judicial decisions have been hostile to labor unions.

Labor Troubles at Home

A general coal strike in the United States is likely to be declared on April 1. On March 5 the anthracite operators, meeting at New York, formally rejected the miners' demands for increased pay, shorter hours and recognition of the union. A conference of the executive committees of the operators' and miners' organizations was scheduled for March 12. Retail prices have been advanced.—John Mitchell, vice-president of the American Federation of Labor, declined on March 6 to give to Judge Wright, of the Supreme Court of the District of Columbia, any

assurance that he would "hereafter lend adherence to the decrees of the judicial tribunals of the land." To do this, he declared, would be to admit that he had previously failed to comply with lawful decrees. This is an echo of the contempt charges against Messrs. Gompers and Mitchell in the Buck Stove and Range boycott case.—Tho the correspondent of the Boston *Transcript* estimated that there were 15,000 employees working in the Lawrence mills on March 5, the Industrial Workers of the World claimed that 15,000 were still on strike and only 5,000 at work. The report of the American Woolen Company for the year ended December 31, 1911, shows net profits of \$3,222,916, to be compared with \$5,798,058 in 1909 (the best year in the history of the company) and with \$1,280,000 in 1908. The company's total surplus after paying the usual dividends was \$11,597,731; total assets, \$76,888,801.—Sixty children were sent from Lawrence to Philadelphia last week and one hundred more will follow this week, it is announced. Col. Leroy Sweetser, who has been in command of the militia at the mill town, and who opposed sending children away, has been relieved from duty at his own request. The military force is now reduced to 350 officers and men. At Washington, the examination of witnesses by a Congressional committee has continued, Mrs. Taft having attended several sessions. Witnesses have testified to the roughness of the police; that thoro provision had been made for the entertainment of the children prevented from entraining at Lawrence, and that the permission of the children's parents was secured before they were taken to the railroad station. An inquiry into the capitalization and operations of the American Woolen Company will be recommended by the House Committee on Rules, which has held these hearings, and this investigation by the House Committee on Labor will extend to labor conditions.—More than 125,000 employees of the textile interests in Northern New England will profit by an advance in wages declared at Boston on March 9. The general rate of advance is from 5 to 7 per cent. The Lawrence millers offer an average increase of 7½ per cent.

Dangerous Condition of Mexico

The situation in Mexico was not improved last week. In the north Orozco held the city of Chihuahua, and was joined there by 2,000 rebels from Juarez. Their commander, Salazar, suspecting that Orozco had not really turned against Madero, insisted that he should come to his camp, near the city, and take a revolutionist's oath. Madero's former lieutenant promptly complied. Whereupon he was proclaimed general in chief and he gave notice that he was about to march to Mexico City at the head of 5,000 men. He deserted Madero, because the latter, having paid to him 50,000 pesos, refused to pay 50,000 more. The commander at Juarez looted the banks there, and Orozco demanded from the railroads all their traffic receipts. Governor Gonzales fled, and the Legislature elected one of Orozco's men in his place. Villa, commanding a small Federal force, remained inactive and was not disturbed. From the national capital a force was sent northward, and at the beginning of the present week it was expected that a decisive battle would soon be fought in the vicinity of Torreon. Anarchy prevailed in Sinaloa, where the Americans were huddled together in two or three towns. The movement of troops northward left but a small force in or near the capital, as Mexico's entire army is said to be only 7,500 men, with 55 scattered companies of rural guards. Madero called for volunteers, and made use of 85 military school cadets. Foreigners remaining in the capital prepared to defend themselves, but thousands had fled. There was danger that the city would be captured by rebels near at hand. In half a dozen southern States there was fighting. Thousands of mill employees quit work and joined the bandit armies. There was talk of intervention, and Foreign Minister Calero declared, it was said, that resident Americans would be held as hostages if our troops should cross the boundary. He denies that he said it. Madero considered the formation of a new cabinet, with De la Barra at the head of it. France decided to send a warship to Vera Cruz. All the political clubs at the capital petitioned Congress for the resignation of Madero. The banks sent their cash to the national

treasury. Americans agreed to defend themselves in the walled enclosure of a packing company, if the city should fall. Foreign ambassadors talked of calling upon their governments for marines. Additional regiments of our troops were sent to the border, and at Washington General Wood considered a plan for mobilizing an army of 100,000 men, two-thirds militia.

Central and South America

Secretary Knox left Costa Rica on the 4th, after a round of festivities at the capital, and sailed for Nicaragua. At the Pacific port of Corinto he was greeted by officers of the Nicaraguan Cabinet, who accompanied him to Managua on a special train. To avoid misfortune this train was preceded by one carrying fifty soldiers and a machine gun, and followed by another armed in the same way. Colombians and supporters of Zelaya, the deposed President, had attacked Mr. Knox in certain newspapers, even suggesting violence. On the day of his arrival at the capital, all the newspapers were suppressed and the staffs of two of them were arrested. In all, about one hundred men were placed in jail. One of them had been Zelaya's Minister of Finance. These malcontents excepted, the people of all factions united in giving Mr. Knox a hearty welcome, and in a public address President Diaz expressed gratitude for the moral protection and aid of the United States, which had enabled the removal of Zelaya by revolution. At a reception given by Congress, Mr. Knox said:

"My Government does not covet an inch of territory south of the Rio Grande. The full measure and extent of our policy is to assist in the maintenance of republican institutions in this hemisphere. We have a well known policy regarding causes that might threaten the existence of an American republic from beyond the sea, and shall always be found willing to lend proper assistance to preserve the stability of sister American republics."

The Secretary went from Nicaragua to Honduras. Colombia's chargé d'affaires at Washington has been authorized by his Government to say that Mr. Knox was not invited to visit Colombia. Colombia merely said he would be welcomed.

The South Pole Discovered

Roald Amundsen reached Hobart, Tasmania, on the "Fram,"

March 7, and sent the following cablegram in cipher to his brother, Leon Amundsen, at Christiania: "Pole attained, December 14-17, 1911. All well." A preliminary account of his expedition was dispatched next day to the *London Chronicle*, *Paris Matin*, and *New York Times*, but Amundsen refused to give out any further information or to permit any of his crew to land except himself. No one was allowed to go on board the "Fram" except the officer of the port. It was rumored from New Zealand that Robert F. Scott, who was in charge of the British expedition, had also reached the South Pole, but there appears to be no basis for this report and Amundsen denies any knowledge of the matter. Captain Scott left England June 1, 1910, on the "Terra Nova" with sixty men and an expensive equipment, including motor sledges and ponies. The British Government contributed \$100,000 toward the undertaking and the same amount was raised by public subscription. After landing Scott's party at McMurdo Sound the "Terra Nova," in exploring the Bay of Whales, ran across the "Fram," 400 miles to the eastward, on February 4. Amundsen had not announced in advance his intention of entering the race for the Pole, and when the "Fram" left Europe it was supposed he was bent on Arctic exploration. The "Fram," which the Norwegian Government had placed at Amundsen's disposal, was constructed expressly for polar work, and is fortified on the sides with nearly three feet of tough timber, four feet at the bow, to withstand the ice pressure. On her maiden trip in 1893-6 she carried Nansen to the north, and again in 1905. The vessel is only 113 feet long and 36 feet of beam. Captain Amundsen was educated at the University of Christiania as a physician and attained world-wide fame when, in 1903, he made his way with the sloop "Gjoa" and seven men thru the Northwest Passage, which explorers had been seeking in vain for three centuries. He states that it was not until he had reached Madeira in October that he proposed to his crew to strike for the South Pole. They

THE "FRAM" LYING AT ANCHOR AT STAVANGER

voted unanimously for the change of plan, and by January 14 he was settled at "Framheim," on the Bay of Whales, longitude 164 degrees west, latitude 78 degrees 40 minutes south. The "Fram" returned in February to Buenos Aires. Amundsen and his men spent their time until the sun disappeared on April 22 in establishing depots of seal meat and provisions along the line of their proposed route southward, the third and last at 82 degrees. On August 24 the sun returned and by September 8 a start was made, but it was found too early in the spring, so the undertaking was delayed until October 20. The party was then divided; three men to explore King Edward Land to the east and the rest, numbering five, to start for the Pole with four sledges and fifty-two dogs. The ground was good and the dogs were able to make 20 miles a day. Provisions were cached at every degree, the chief depot being established at the edge of the great ice barrier at 85 degrees. The ascent of the barrier was difficult, but was surmounted in four days, and the plateau reached at an altitude of 10,600 feet. Here they encountered terrible

blizzards lasting eight days. All of the dogs were killed off and eaten excepting six for each of the three sledges. Their route was straight south, following the course of a range of mountains to the eastward, which they named after Queen Maud. Several of its peaks were found to be about 15,000 feet high. The range was passed by means of the "Devil's Glacier," the ascent of which required three days on account of the crevices and holes. Beyond the ice field was smooth, but was hollow and treacherous. The highest altitude reached on the journey was here, 10,750 feet. On December 8 Depot No. 10 was established just beyond the farthest point reached by Shackleton two years before, 88 degrees 65 minutes. On December 14 the latitude was determined as 89 degrees 55 minutes, and on the 16th a camp, called "Polheina," was made at the exact Pole, as close as that could be determined by the use of a sextant and artificial horizon. The sun was bright and observations were made every hour for twenty-four hours. The Norwegian flag and the "Fram" pennant were hoisted and the vast smooth plain

about the Pole named "King Haakon's Plateau." This, however, is the same plateau as was reached by Lieutenant Shackleton and named by him after Edward VII. On December 17, the return trip was begun and completed by January 25, 1912, an average of nearly 22 miles a day.

British Strikers and Suffragets

No apparent success has been attained in the efforts to stop the coal strike, and its disastrous effects are being felt thruout Great Britain and even affect Europe generally. Besides the million miners who have struck, it is estimated that over 750,000 more workmen have been thrown out of employment in consequence. The unemployment benefit funds of such unions as the Steel Smelters' Union and the Amalgamated Society of Engineers have been heavily drawn upon, and the members are feeling that they will be called upon to make too great a sacrifice in the interests of the

miners if the strike is not soon settled. The miners' unions have funds invested in stocks and mortgages amounting to \$12,500,000, but it is a question whether they could realize on them in the present emergency. The total amount of the trades unions on hand is about \$30,000,000. A national conference to discuss the situation has been called by the Government for March 12, but the prospects for an agreeemnt are not favorable. The miners insist upon the adoption of their minimum scale of wages as the necessary preliminary for negotiations, and the South Wales mine owners declare that if they are compelled to pay a minimum wage they will be put out of business. Syndicalism has become an important factor in the contest and has completely altered the methods and temper which formerly characterized the English trades unions. Secret pamphlets have been circulated, calling upon the miners to adopt a revolutionary policy, and by means of sabotage and dilatory work to destroy the

AMUNDSEN (ON THE LEFT) AND THE CREW OF THE "FRAM"

profits of the mining industry, in order that the miners may take possession of the mines and run them in their own interests. Municipalities and private owners are exercising the greatest economy in the use of fuel. Lights in the houses and streets are turned out as early as possible, and the street car and suburban railway service reduced to its lowest terms. A third of the cross channel boats have been taken off, and such of the passenger and freight trains on the roads as can be dispensed with. The western coast of France, which receives its coal from England, is feeling the shortage seriously.—The Socialist Miners' Union of Germany has announced that over 200,000 miners of the Westphalia coal district will go out on strike this week unless the employers consent to an increase of 15 per cent. in the wages. The Hanover coal miners demand a monthly minimum wage of \$25.—The British Government has determined upon more severe measures for the suppression of the suffrage disturbances. Seventeen of the women who took part in the window smashing were sentenced to hard labor for a month or two. Among them is Miss Alice Morgan Wright, an American artist, a graduate of Smith College, who came over from Paris on purpose to take part in the fray. Mrs. Eleanor Jacobs, the wife of W. W. Jacobs, writer of sea stories, was sentenced to one month at hard labor for window smashing. Mrs. Emmeline Pankhurst and the other women imprisoned in Holloway jail refused to conform to prison discipline, tearing up their clothes and work and smashing windows. For this they were put into solitary confinement. It is understood that they will adopt the policy of the hunger strike and force the Government to the alternative of permitting them to starve or resorting as formerly to forcible feeding. The Government has decided to bring action for conspiracy to riot against the leaders of the movement, and Mrs. Emmeline Pankhurst and others were arraigned on that charge. The maximum penalty for conspiring to incite malicious damage to property is seven years' penal servitude. The police raided the headquarters of the Women's

Social and Political Union and seized the books and papers in order to secure evidence of the conspiracy.

The Inauguration of Yuan

Yuan Shi-kai was inaugurated President of the provisional government of the republic of China at the Foreign Office in Peking, March 10. The ceremony, like all others under the republican auspices, was characterized by extreme simplicity and informality. The secretaries and military attachés of the American Legation were the only official representatives of foreign legations in attendance. Yuan Shi-kai made the following declaration:

"Since a republic has been founded there is much work to be done. I will try faithfully to develop the republic, remove the disabilities of absolutism, observe the constitutional laws, develop the country's welfare, and bind the five races of the nation strongly together. When the National Assembly appoints a permanent President I will retire. I swear this before the Chinese republic."

At the conclusion of his address, two yellow-robed Lamas approached the President and presented to him a ceremonial scarf, which he laid upon their necks, symbolizing the sovereignty of China over Tibet. The President has appointed Tang Shao-yi, who was educated in America, as Premier of his Government, and Wu Ting-fang, formerly Minister to the United States, to be Minister of Justice. The international syndicate of bankers representing the United States, Great Britain, Germany and France has agreed to advance to the Peking and Nanking governments sufficient money for their immediate needs. A sum of about \$224,000 was placed to the credit of the new President, and similar funds will follow from week to week. The four Powers constituting the financial group have agreed to admit Russia and Japan whenever the financiers of these countries are prepared to contribute to the loans. The rioting by the soldiery appears to have had loot for its sole object, and altho similar disorders are reported from many parts of the country, it does not appear that they represent any organized movement against the new Government.

The New Grand Central Terminal

BY SYDNEY REID

NEW YORKERS will find it difficult to restrain a thrill of wonder and admiration when they realize what the New York Central Railroad has done, is doing, and is going to do in regard to its new terminal. Piece by piece, it is making all things new—and better. The old terminal—that was one of the wonders of the world forty years ago—has been torn down and carried away and the new put in its place without disturbing train service, tho more than 400 trains a day are going in and out. Blasting and excavating on an immense scale have proceeded beneath yards and tracks, so that the railway has burrowed underground and restored the surface to usefulness.

The new Grand Central terminal is to be the greatest in all the world from many standpoints, but instead of further crowding and inconveniencing the center of Manhattan, where it is located, it will relieve the crowding, obviate the inconvenience, and make things pleasant and easy to ordinary New Yorkers as well as to railway passengers.

The old terminal and its yards blocked

that portion of the city which lay between Forty-second and Fiftieth streets and Lexington and Madison avenues. No streets traversed this area, and the only way to get from the east to the west side of the yards was either to walk all the way around or to climb up to the footbridges and to cross by their means.

When a corporation swallows city streets they generally stay down, but this is an exception. All the streets that the New York Central Railway swallowed for its old terminal and yards are now to be given back in good order and full width. The yards are eliminated; steam has gone; electricity does all of the hauling in the city limits; all the tracks go underground on two levels, and the cleared surface of the area formerly occupied by the yards is to be covered with beautiful buildings harmonizing in architecture and design with the terminal itself.

Park avenue, which for so many years stopped short at Forty-second street, is to be graded up to make elevated roadways around the new terminal—fifty feet broad on each side. These roadways will grade down again on the

northern side of the terminal building, and Park avenue will continue on to Harlem from Forty-fifth street, a grand boulevard, one hundred and twenty feet in breadth.

Besides the very great convenience which the new arrangement will make for citizens generally, there will be as great or even greater convenience for the railway passengers who use the terminal. These now number about seventy thousand a day, having grown from sixty thousand five years ago. Express and suburban passengers will be handled on different levels, the express level being immediately under the street surface

and the suburban level below that. The express level will have forty-two tracks and the suburban level twenty-five. Each level will throw a loop around the terminal, which will front on Forty-second street, as did its predecessor. This separation of services will obviate a great deal of present congestion and confusion. Incoming trains will run in on the western side of the terminal, where passengers will step off. The trains will then go around the loop, the baggage cars be shunted

to the baggage room, the other cars going to the storage yard, where they will be examined and cleaned, batteries re-charged, and dining cars re-stocked for another run. There is to be no mixing, therefore, of passengers and baggage trucks on the same platforms. The suburban traffic will

be handled in very much the same way. The levels are to be connected by four approach tracks—two for inbound and two for outbound trains—about Fifty-third street. Each level can be run independently, and equipment can be transferred without confusion, an insurance against serious block.

The Interboro subway to Brooklyn and the Bronx, the McAdoo tube to New Jersey, and the Belmont tube to Long Island City all come into the new terminal. The Interboro subway station will be on the express floor, the McAdoo tube station on the suburban floor, and the Long Island tube station

below that. Incoming passengers of the New York Central and New York, New Haven & Hartford lines will have only a short walk inside the terminal in order to get trains to any part of Manhattan, Brooklyn, or nearby New Jersey or Long Island.

In its last issued timetable, "January 15th, 1912," the New York Central Railway devotes a page to cheerful announcements about its great undertaking. It says, concerning the "New Grand Central Terminal":

"This magnificent structure now in course of construction will displace a station that for forty years has been the only terminal in New York City. The construction of the new building will in no way interrupt or delay the traffic of the terminal."

"The Grand Central terminal is the center of the hotel, residence, club and theater district, and is the only station on the subway, elevated and surface lines, these offering quick

MAIN OUT-BOUND CONCOURSE OF THE NEW GRAND CENTRAL TERMINAL.

CROSS SECTION OF MAIN BUILDING, GRAND CENTRAL TERMINAL

Note the use of inclined ways thruout in place of staircases

access to all parts of New York and Brooklyn. The architecture is an adaptation of the French renaissance."

Some of the details are as follows: Total area of the old terminal, 23 acres; new terminal, 70 acres (including both track levels). The new station at the street level will be 600 feet long, 300 feet wide and 105 feet high. Below the street level it will be 745 feet long, 480 feet wide and 45 feet deep. The old terminal had a capacity of 366 cars. The new terminal will have a capacity of 1,149 cars.

The company triumphantly announces that "the new terminal will be the best in point of construction and in all details of arrangement that money and engineering skill can provide."

The new terminal is to be finished this year. The front will be of white marble, with the central part of the façade in the form of a triumphal arch, surmounted by a statuary group measuring forty-four feet across. The central figure will represent Progress, and other two figures will stand for Physical and Mental Force. Underneath the group will be a clock with a fifteen foot face. With concourses and other annexes, the new terminal will extend from Forty-second to Forty-fifth street.

The main terminal building will be for outgoing passengers only. The express train waiting room there will be 200 feet long, 80 feet wide and 50 feet high. The walls will be cream colored and without adornment. Under this express train waiting room will be the suburban waiting room, not quite so large.

Adjoining the waiting rooms on their different levels will be the concourses, enclosed and heated, presenting an agreeable contrast to the open, windy spaces wherein passengers formerly were obliged to transact some of their business. Here will be found ticket offices, baggage checking booths, information bureau, etc. Conveniences are arranged progressively, ticket window first, Pullman window next, baggage office third, and so on, in order that no steps need be retraced.

Travelers will not be compelled to visit the baggage room. They will present their railway tickets and claim checks at a window in the concourse and

receive their baggage checks. Their claim checks will go down to the baggage room by means of a pneumatic tube.

Just north of the concourse will be the driveway for cabs and baggage wagons. There will be two large baggage rooms, one for incoming and the other for outgoing. Three groups of elevators at this point will make easy access to all the levels. There are to be no stairways in the new terminal. Ramps, or inclined ways, with a grade of six to eight per cent., take their place. The gentle slope is hardly perceptible to pedestrians.

The "Kissing Gallery" is to be a balcony in the incoming station, especially arranged for persons who come to meet friends or relatives. There will be room for two lines of these expectants, and the elevation will give them a clear view of the doors through which arriving passengers must enter.

An agreeable innovation is to be the dressing rooms for men and women. These will particularly appeal to commuters planning to attend theaters or social functions. They can check their suit cases and engage rooms when they arrive in the morning. In the evening they can return to the station and dress, leaving their business clothes in the parcel room to be picked up on their way home. But this convenience pales into insignificance when we learn that a hotel twenty-three stories high, costing about \$5,500,000, is to be one of the buildings erected over the terminal. The structure will contain more than a thousand rooms, and will accommodate 1,200 guests at a time. In cubic space, this will be the largest hotel in New York.

Three million cubic yards of excavating have been or are being done, and two-thirds of this has been through solid rock, necessitating blasting, so that the engineers have had constantly to provide against the danger of destroying tracks, crowded trains and buildings. They have had to solve a succession of appalling problems, and their triumph comes near to marking the limit of human achievement.

Perhaps the greatest performance was taking down the old train shed while the rushing traffic went on underneath. The building was of brick, glass, steel and iron, 600 feet long, and having a

A BIRD'S-EYE VIEW OF THE NEW TERMINAL AND ITS SURROUNDINGS

span of 200 feet.' An enormous moving traveler was built to conform to the contour of the train shed and move on wheels. This traveler was floored over, and had wind shields at one end. The shed was removed in sections of 20 and 40 feet. Work of removal went on during the day, while at night, when regular traffic slackened, work trains came in and carried away the debris. In this manner were removed 1,350 tons of wrought iron, 350 tons of cast iron, 90,000 square feet of corrugated iron, and 60,000 square feet of glass.

The New York Central Railway, under a joint agreement with the New York, New Haven & Hartford, has done

or is doing all the work. The total cost will amount to about \$180,000,000, and the railway company expects to get this back by means of the exceedingly valuable real estate which it has reclaimed. It will lease some of its property, with restrictions compelling harmony of architectural design within the terminal area. Some of the finest apartment houses in the city are to be erected upon the extension of Park avenue.

Buildings already constructed or planned for the terminal group include the Merchants' and Manufacturers' Exchange (completed and in use), thirteen stories high; the railroad office buildings, some of which are already occupied and

which will ultimately extend from Forty-third street to Forty-fifth street on Lexington avenue and over to the main station; an incoming station west of the main station, and a railroad Y. M. C. A. on Lexington avenue.

The plans provide not only for the twenty-three story hotel above the incoming station, but also for the possibility of a twenty story office building over the concourses. The steel frame and foundations of the main terminal building are strong enough to bear the additional burden which ultimately may come upon them. There is a tentative plan for a great opera house and a rumor concerning a vast wholesale mar-

ket where goods and produce brought in by trains may be sold. But these projects are still nebulous.

The work began about six years ago, when the railway company quietly bought in the additional property that they needed. Since then labor has continued strenuously—night and day for the most part—and it will continue for several years longer, though, as said, the main terminal building will be completed by 1913.

When 1916 arrives, Manhattan will have a new beauty spot, its very heart, where erstwhile utilitarian ugliness despotically reigned.

NEW YORK CITY.

Our Monetary System

Part II. Its Need of Reformation

BY NELSON W. ALDRICH

EX-SENATOR FROM RHODE ISLAND AND CHAIRMAN OF THE NATIONAL MONETARY COMMISSION

THE Monetary Commission has made its report to Congress; the result of its arduous labors to devise some plan for the betterment of our financial system, and it now remains for the people and their representatives to give all possible and thoughtful attention to the subject, with the determination to reform the weaknesses of our present methods, and establish our banking system upon a firm foundation, where it will command the respect of and be able to co-operate on equal terms with the great banking organizations of the world for the safety of all of our business institutions at home and the honor and integrity of our credit abroad.

The formation of clubs and societies for the study of economic questions is a hopeful sign of the times. Modern economic conditions have developed new problems of vast importance, which are pressing upon the American people for solution. And among them none is more important, with reference to the future development and welfare of the country, than that which was submitted to the Monetary Commission: the question of

how best to secure a comprehensive organization of our financial institutions and a thoro reconstruction of our monetary system. It is one of vital interest to the people of every class and in every section.

There can be no wise or permanent legislation, no final solution of this problem, which is not supported by intelligent public opinion. And the enlightened public opinion must be based on the final judgment of thoughtful men who have thoroly investigated the great question from every practical and theoretical point of view. But at the outset we must fully realize that no plan for the reorganization of our credit institutions, no plan for regulating our note issues, can or should be adopted where there is the slightest possibility that the organization or its business can be controlled by political influences or by any combination or clique in New York or elsewhere.

The most important task assigned to the National Monetary Commission was that of devising a means by which this great country may, in the interest of all

its people, of every class and every section, secure that immunity from financial disaster which, for half a century, has been enjoyed by the people of every other great commercial nation—immunity from the disastrous results of monetary panics and acute financial disturbances. Every effort has been made to devise a method which will protect the rights and afford security to bank depositors and enable banks at all times to respond to every legitimate demand for the credit and currency so essential for the development of our industries.

If it has been successful in solving the complex and intricate problems, of planning a monetary system for the United States which will answer the present and prospective needs and requirements of the economic life of this great people, it will have done much to create and sustain a feeling of confidence in the safety and efficiency of our banking system. Its work is done and the matter now rests with every intelligent citizen of the United States and our representatives in Congress.

The first question which presents itself to us is whether we will allow to continue a condition of affairs in which the whole country is absolutely dependent upon the accumulated capital in New York City, or whether we will insist upon a reorganization of credit which will put the control of the cash reserves of each section of the country and its rediscounts into the hands of local organizations under local control and beyond the control of others, either in New York or elsewhere, except by voluntary consent.

Today, for example, our banking institutions have little to do with financing in a large way the movements of our products. It is not thru any lack of banking facilities in this country. In fact, it is almost impossible to realize what the recent growth has been and what progress we have made in every direction, physically and financially. In the last ten years the banks of the country have increased in number from 10,000 to 25,000. In the same time the banking resources have increased from \$10,000,000,000 to \$21,000,000,000. Today I believe the banking resources of the United States are equal to those of all the other commercial nations of the

world combined. Why not give these banks an opportunity to participate, for the benefit of their depositors, with the foreign banks and the banks of New York in furnishing the credit so essential to the satisfactory movement of our crops to the markets?

We have \$2,000,000,000 worth of exports and \$1,500,000,000 of imports annually. We have a value of manufactured products and of agricultural products that is almost beyond the power of conception or imagination. We have \$9,000,000,000 worth a year of agricultural products alone. To assist in the movement of these products from the producer to the market, the furnishing of facilities by which this great internal and external commerce is carried on is the proper and legitimate function and duty of the banks of the country; and the fact that the financing of our imports and our exports is entirely in the hands of foreigners is a disgrace to the United States and to the intelligence and progressiveness of the people.

In devising a plan suitable for the United States we must consider the magnitude of the interests involved as well as the resources, the wealth, and the remarkable development and growth of the country, financially. We must provide not only for the necessities of today but with reference to the future needs and development of the great nation. The principles must be laid down and the machinery provided that will properly take care of any possible increase. And it is another absolute prerequisite to any plan that it shall be superimposed upon existing banks, and not in any way or to any extent involve their independence, their local business or their character.

The frequent failures of our monetary system to sustain the credit of the country in times of stress can be attributed in the main to three apparent weaknesses, to the obliteration of which we must direct our attention in forming any plan which will prove successful. First, there is our inability to enforce that effective co-operation of banks which is necessary to protect public and private interests in times of crisis. Then there are the limitations and restrictions imposed by antiquated laws with reference to the treat-

ment of reserves, rendering the banks all over the country helpless at the moment when they must be most ready to help. And, last, a defective, inelastic and unscientific system of note issue.

The natural co-operation of banks for mutual support at critical times is now rendered impossible by unwise, artificial restrictions. And the lack of co-operation in times of pressure transforms the individual banks from a condition of independence to one of complete isolation and dependence. In emergencies they are without power to serve successfully the interests of either their stockholders or the public. The banks and the business of the country have now no reliable resource upon which they can depend at all times for the protection of vital interests. Exceptional demands made upon the banks for credit, and the regularly recurring movements of lawful money from one section of the country to another, are important disturbing elements, liable to lead to widespread distrust, resulting at times in a general suspension of payments and the complete disruption of all exchanges.

It is not the anticipation of danger from inadequate reserves or an insufficient volume of currency which creates the conditions of distrust. It arises to a large extent from a knowledge on the part of the banks themselves and on the part of the public dependent on them for credit that when trouble comes the banks may at any time find themselves, by reason of our present rigid provisions in regard to reserves, absolutely powerless either to furnish currency or to afford customers the credit accommodations so essential to the needs of their business. For example: If the afternoon papers should announce that there had been a disturbance in Wall Street, and that one of the great financial institutions in the city had failed, there is no one anywhere in the country who would not be properly apprehensive of serious trouble. For in the last analysis, the banking institutions of New York today control the monetary situation of the country. The country bank is dependent upon its correspondent in a near city, and the city bank is directly or indirectly dependent upon its correspondent in New York. When New York suspends the country

suspends. In the panic of 1907 how many sound banks and trust companies and savings banks had to close their doors so far as payments were concerned? The suspension of banks was universal.

Why is it that these defects have not been cured? Why is it that when all of the other great nations of the world have been operating for fifty years under systems which have rendered them absolutely immune to panics and financial crises the United States alone—the country which, by virtue of her vast resources, is at the head of the great commercial nations of the world—is still clinging to an antiquated monetary and banking system—or want of system—which is a disgrace to the American people? It seems inexplicable, and yet we have not far to search for an answer. Were it not for our unrivaled natural resources and the characteristic energy of our people, which have given us such an unprecedented prosperity and rapid growth in wealth in spite of all obstacles, we should long since have found the defects to which I have referred intolerable. Our great natural advantages have enabled us to go on suffering losses that would have ruined any other country. Great and continued success creates in the people a natural condition of inertia, which produces an unwillingness to consider reforms involving a solution of difficult problems. With the conservative character of our business men and bankers, who dread all radical changes, and the extreme difficulty of securing an agreement on the character of adequate legislative remedies, the work of monetary reform in this country has moved slowly. The experience of the other countries has been different from ours for reasons not difficult to understand.

Every financial institution in the United States is in peril, today, whenever confidence is impaired in the strength of the New York banks or in the wisdom of their management, and this dangerous condition of dependence will continue until we have a thorough reorganization of our banking system. This was the task to which the Monetary Commission devoted itself, and their conclusions are now placed before Congress and the people of the United States in the

hope that they will receive equally earnest attention from the public, and from mature deliberation result in a new and better method, avoiding the weaknesses of our present system and possessing, instead, the strength, stability and invulnerability of the monetary systems of the other great commercial nations of the world.

Is it not worth while to do this? To take the banking institutions of the United States out of a condition of dependent helplessness and place them where they belong, in a class with the best and strongest banking institutions in the world?

There is not a particle of reason why prime sterling bills should forever remain the highest form of credit. We can make, and we ought to make, New York, New Orleans, Chicago, financial centers of equal importance with any in Europe. There is no reason why the entire export and import business of the United States should be financed by the banking institutions of Germany, France and

England, with a toll therefor amounting to millions of dollars every year, levied by the foreign bankers and always paid, in the last analysis, by the American producer. We can and we ought to make a documentary bill drawn by a producer anywhere in the United States, drawn in dollars and cents, equal in currency and value to any drawn in pounds, shillings and pence.

The bankers of the country cannot do this alone. And they are not the people who have the greatest interest in this matter. I invoke for the wise solution of these problems the careful examination and the calm judgment of the American people, confident in the belief that they will find that the march of progress, their own interests, the welfare of their children and grandchildren, and the highest aspirations of American citizenship all urge them to an active participation in the consummation of this great work.

PROVIDENCE, R. I.

A Dialog

BY MARY RUSSELL MILLS

In dim gray sweeps with murmurous swell
The sad sea rose and fell;
In shining, foaming, sparkling grace
The glad sea ran a race.
In deep waves billowing soft and long
The sweet sea sang a song;
In fury lashed with thunderous roar
The mad sea struck the shore.

"O sea," I cried, "art thou no friend
On whom I can depend?
When I would find thee thus or so
Other thy mood doth show."

"I am thy friend," the sea replied,
"In every mood and tide;
For thou, too, hast a changing heart
Of which I am a part.
Thy mind doth change and shift and play
With every passing day.
And thou hast ever-varying powers
To match the varying hours.
I show thyself, but not the whole;

For in thy deeper soul
Dwells a large synthesis and plan.
Wherein the higher man
Collects, commands his powers at will.
Works steadily and still;
In patience, love and large control
Finding the perfect goal"

"O sea, my friend," again I cried,
"On every wave and tide
Thou bearest me a word of grace;
And I can wisdom trace
In all these words. In my own life
Lie power, and calm and strife.
In my own nature dwelleth all
To please or to appal;
Victim or ruler I may be
Of my own destiny.
Greatness and beauty of the sea,
As thou, too, art in me,
I will be beautiful and great
And serve the larger fate."

LOS ANGELES, CAL.

Winter Sports in Switzerland and Tyrol

BY F. W. STODDARD

WINTER sports! What happy visions the words recall of healthful days spent in the mountains shod with ski or skate, tobogganing, bobsleighing or curling, while breathing invigorating air and enjoying the glorious winter sunshine. Should there occasionally come a day of unfavorable weather, the time is well utilized in cleaning skates, repairing damages to ski or toboggan, or in letter writing, which has probably got sadly into arrears. Altho two decades ago ski-running was all but unknown to Americans, it has worked its way steadily to the front rank among winter sports, and its popularity has latterly grown by leaps and bounds. Summer resorts, which a few years ago went to sleep all the winter, now wake up in December and are full of life for several months. New hotels, too, have sprung up in answer to the demand, and wherever there is sufficient snow and a

comfortable hotel, winter sportsmen will find their way.

One still hears the question asked, What is ski-ing? A few words suffice to explain, but no description can convey an idea of the glorious sensations experienced by the expert, when, after a stiff climb, he glides at great speed to the bottom of a long steep hill, descending in the graceful, serpentine curves which enable the practised ski-runner to fly down the steepest mountains, provided the snow is suitable.

The nearest approach to the joys of the ski-er are those of the tobogganer or bobsleigher, and only the excitement of galloping to hounds on a good hunter over a grass country can rival the emotions experienced by the ski-runner in his downward flight. The ski is made of a long strip of thin board a few inches in width and six to eight feet in length, according to the hight of the user, and

the points are curved up so as to ride over the snow. With such snowshoes one slips along over the deepest snow, sinking but slightly, excepting when it is newly fallen, while on crusted snow one does not sink at all.

When you read of great jumps of a hundred or more feet on skis, do not imagine that the runner can clear a house in his stride, for his powers of jumping are limited to performing on a steep hill prepared for the purpose, with an artificial platform of snow from which to make his spring. These flying leaps, partaking nearly as much of the nature of a drop as of a jump, have no real part in the business of ski-ing, which consists in climbing in mountainous regions—oftentimes with great toil—for the pleasure and excitement of the run down.

Bandy or ice hockey is a favorite and exciting pastime, which is practised wherever suitable ice is found. It calls not only for skill in striking and directing the ball to the goal and dodging opponents, but also in skating, and only those who are young and are active skaters can take part in this fascinating game, whereas grayheaded men may be seen ski-ing, tobogganing and curling. Trotting matches on the ice are popular in Tyrol, but the records do not compare

with those made in America, and the American trotter stands *facile princeps*—the fastest trotter in the world.

Ski-jöring (driving a horse on ski) is a sport which, tho introduced only a few years ago from Sweden, has "caught on" rapidly, and is practised more and more. The sportsman or sportswoman—for many of the latter now indulge in every description of winter sport, accompanying the men on long tours or mountain ascents on ski—drive a horse with long reins, the animal pulling them while standing on their ski at whatever pace the driver fancies over the roads or snow-covered lakes. Considerable skill is required in driving the horse and to avoid coming on his heels going down hill, for which purpose "breaking" is called into play, and it is necessary to maintain an even balance going over rough places. Races for ski-jöring take place at St. Moritz in Switzerland, and ski-running and ski-jumping competitions are brought off at every winter resort on the Continent.

Jumps on ski of over 100 feet are frequently made, and the Norwegians, who first introduced this sport and teach ski-running at some of the principal winter sport resorts, have jumped nearly 150 feet. Tho fascinating as a spectacle,

"FOR THE PLEASURE AND EXCITEMENT OF THE RUN DOWN"

A SKI-RUNNER IN THE TYROL

ski-jumping is by no means a necessary accomplishment for the runner, as he is never called upon to take large jumps on his excursions. To learn to ski is much easier than to learn to skate, and in a few days, after innumerable falls in the snow, when one is tied up into apparently inextricable knots, the beginner learns to balance and to proceed in a fashion, while in a week he is comparatively at home, and, if he have aptitude, in a month he may become an expert. The skater, on the other hand, must practise for months and even years before attaining proficiency.

Tobogganing and bobsleighbing have an enormous number of votaries, who care for no other winter sport, and at St. Moritz and Davos, in Switzerland, there are the two finest runs on the Continent, where competitions frequently take place. The bobsleigh, which seats six persons, is steered by a wheel in front, and owing to the weight, the hard ice bed and the terrific speed, this form of sport is much more dangerous than ski-ing, where falls take place in the soft snow, and in ski-running but few accidents occur, while fatalities are confined to being buried by an avalanche or losing the way and being frozen in the snow. Such disasters are happily of rare occur-

rence, but bobsleighbing accidents are more frequent, and fatal occurrences have taken place.

Curling is another sport which is practised by many enthusiasts, tho the number of these is small compared with the great army of other winter sportsmen, and as yet it has been principally confined abroad to Switzerland, which is the premier country for winter sports, tho Tyrol is waking up and in time may rival its neighbor, as the facilities for all sorts of snow and ice sports in the latter country are unsurpassed. Curling is essentially a Scotch game, dating hundreds of years back, and in whatever part of the world Scotchmen and ice are coexistent there is sure to be curling. Of late years artificial ice rinks provide the where-withal where natural ice is non-existent. The game is played with highly polished rounded granite stones with handles inset, and their weight is about forty pounds. The number of players in each rink is eight—four on a side—and the object of the game is to slide the stones, of which each player has two, along the surface of the ice from one "tee" (the central point) to another "tee," a distance of thirty-eight yards, which he accomplishes with a swinging motion of the arm when standing on the "crampit."

"A HUNDRED FEET OR MORE"

Round the "tee" several rings, each larger than the other, are marked on the ice, serving to indicate the relative positions of the stones after they have been played, and the stone in the central ring counts first. Each player is provided with a broom, and the players on one side sweep the ice clear up to the "tee" before the stones of their side when required to do so, while the opposite side have the right to sweep after the stones have reached the "tee," in order to carry them clear of the circles.

There is much hard work, and perhaps as much skill in knowing when to sweep as in throwing the stone, and it is the duty of the "skip" (captain of the side), who plays last, standing meantime at the "tee," to direct a player where to place his stone (much may be effected by guarding the winning stone by placing other stones in front of it), and when to sweep or to abstain from doing so. By vigorous sweeping a stone may be landed the winner, whereas if left alone it might

have remained short of the circles, and a stone which would have remained near the "tee" may be swept out of the circles.

The excitement displayed among curlers is unrivaled at any other game. Broad Scotch is shouted, and the stentorian exhortations of the "skips" to sweep or refrain from doing so—"Soop, soop, man"; "Haud up, noo"; "Man, yer a curler"—resound loudly thru the Alpine valleys. Only those who have witnessed the game of curling can form any idea of the keenness of the players, who at times shake each others' hands, embrace and wave brooms in the air in their joy at some successful shot. Now and then a man may be seen prone on his stomach on the ice watching the progress of his stone, and curlers generally conduct themselves as tho their welfare in this world and the next depended on the course taken by a stone and the exact spot where it finally came to rest.

At the annual curling "Bonspiel" to compete for the cup, which was held lately at Kandersteg in Switzerland, where the writer took part in the competition, there were nine rinks, composed of seventy-two players, with the exception of four Swiss, all Scotchmen living in Scotland and England. The "skip" of the winning rink, which won by one stone or point after a breathless final, was carried shoulder-high off the ice amid the wild hurrahs of the spectators. At the presentation of the cup in the evening, in thanking for the trophy, the "skip" modestly declared that the worst rink had won. Such is the generous spirit by which brother curlers, who have a guild of their own somewhat akin to that of the Free Masons, are animated the world over.

To instance the love of Scotchmen for curling and the extent to which it is played in Scotland when the ice permits, the other day a "Bonspiel" was held at Lochwinnoch, in which no less than thirty-six rinks, with 288 curlers, took part in the "roaring game."

Just before Christmas special trains carry thousands of winter sportsmen and sportswomen, provided with ski, skates and curling stones, from London to the Continent, and some of the Swiss resorts, where there is a round of even-

ing gaieties, are as full, if not fuller, in winter than in summer. New places are constantly being opened up for winter sports, many English taking their holiday abroad now in winter in place of summer as formerly.

While Switzerland was the first country on the Continent to draw winter sportsmen to its mountains, and tho it is still by far the most frequented, Tyrol, a Crown land of Austria, which bounds it to the east, has snow and ice facilities every whit as favorable; the scenery is more wonderful, and it only requires to be more known to attract an increasing number of winter sportsmen. The great charm of the landscape in Tyrol consists chiefly in the fantastic Dolomite Mountains, whose counterpart is seen in no other part of the world. These rocky elevations, said to be the work of the coral insect, with their towers and battlements recalling the ruined castle, and their jagged spires and pinnacles, when seen in the alpen glow, as the sun sets, lighting up the rocks with a brilliant red, is a sight never to be forgotten.

The customs and people in Tyrol are primitive and interesting; at the same time there is excellent hotel accommodation. The university town of Innsbruck, capital of Tyrol, which is situated 2,000 feet above the level of the sea, has

ample facilities all round for reaching winter sport ground, besides having one of the finest skating rinks on the Continent. Innsbruck is a lively little garrison town, and in carnival time, when public balls are held, one may see the Tyrolese in native costume. There are also masked and fancy balls, where the fun is kept up till morning. Many people choose some place for winter sports where, after the day's work or play is done, evening distractions can be enjoyed. For such Innsbruck, with its theaters, concerts, balls, etc., is specially suited, and the Hotel Tyrol has long been the headquarters of English and American visitors. Near by is Igls with splendid ski-ing grounds and toboggan runs, and further afield are the villages of Kitzbühel, unrivaled for ski-running; Gossensass, Cortina, in the heart of the Dolomites, and many other places.

The voyage over the Atlantic is now so rapid and easy that it is somewhat remarkable that American sportsmen do not run over for a few weeks at least and join their brother sportsmen from England in Switzerland or Tyrol. Winter lasts from the middle of December until the middle of March, and those who once taste the joys of winter sports in the Alps return again and again.

WESSOBRUNN, MERAN, TYROL.

The Meadow Lark

BY ADALENA F. DYER

THE trumpeter of March had blown
Defiance to his wintry foes;
But still their white encampments shone
On northern slopes in hostile rows.
My heart was hungry for the spring.
Long had her absence been and drear,
When suddenly I heard him sing—
The meadow lark—"Spring o' the year!"

From leafless boughs he sweetly sang,
No doubt was in his cheery note;
But faith and trust unshaken rang
In music from his golden throat.
He knew that no caprice of man
Could check, like Joshua of old,
The mighty sun's approaching van
Or spring in icy fetters hold.

My heart grew lighter at that voice
Undaunted by the frozen fields,
Foretelling earth would soon rejoice
In all the largess summer yields.
Perched on the elm tree's shrunken boughs,
He sang, that March day, sweet and clear—
Well knowing May would keep her vows—
"Spring o' the year, spring o' the year!"

SOUTH PORTLAND, ME.

What Democratic Revision of the Tariff Really Means

BY REED SMOOT

UNITED STATES SENATOR FROM UTAH.

AMONG the greatest questions with which every government is confronted is that of keeping its people employed, and at a wage rate sufficient to allow them to live in accordance with the standard established in the particular country in which they reside. The older governments of the world have long struggled with this problem. As civilization advances in each particular country, the problem becomes more serious and it requires the judgment and wisdom of the greatest statesmen to even partially solve the question.

The God of Nature has so blest this country with vast areas of fertile soil, natural resources of untold wealth, and mountains filled with precious metals, that up to the present time our Government has not been compelled to consider seriously this question; but the time is fast approaching, if not already here, when it must be met and solved by the representatives of the American people.

The standard of living of our laboring man is the highest in the world. This can only be maintained by our Government adhering to the policy of protection. By protection I mean a tariff rate sufficiently high to enable our industries to maintain their present wage scale and keep their plants in operation. No honest manufacturer or believer in the principle of protection would expect a higher rate. A consistent protectionist I honor; an open and avowed free trader I respect; but a man who demands high protection on the wares made by himself and free trade on everything he has to purchase I neither honor nor respect.

During this session of Congress the American people will have an opportunity to see the difference between a Democratic tariff bill for revenue only

and a Republican measure providing a rate of duty sufficient to cover the difference in the cost of production in this and foreign countries. The tariff bills passed during the extra session of Congress by a Democratic House, if enacted into law, would have destroyed many an American industry, not in one section alone, but in every part of our country.

So far this session the Democratic House has, under caucus domination and gag rule, passed but one tariff bill. This bill revises the present rates of duty on the metals and manufactures of the metal schedule. Hon. Oscar W. Underwood, in speaking for the new schedule, admits the reduced rates will allow twenty million dollars of additional importations the first year. It may allow one hundred million or more, but whatever the amount of increase in importations, be it twenty or one hundred million, the American laboring men will be deprived of the employment required to produce the increased imports and the foreign laborers will reap the benefit.

If newspaper reports are true, other schedules of the Tariff Act are to be treated in even a more drastic manner. The sugar schedule is to be revised and rates made low enough to destroy the home production of beet and cane sugar, thus placing in the hands of the Sugar Trust and sugar refineries the importation and distribution of all the sugar consumed by the American people. The public is informed thru the press that the Democrats claim that, in the revision of the sugar schedule, a saving of 2 cents per pound will result to the American people. The rate suggested is to be 1 cent per pound, with the present differential of 20 per cent. allowed to Cuba. It is rather strange how 2 cents per pound will be saved by such a

revision when the present rate from Cuba, where we get practically all of our imported sugar, is 1.34 cents per pound, and the proposed rate from Cuba would be 8/10 of a cent per pound, or a difference of only 54/100 of a cent per pound.

The loss of revenue to the Government which would be caused by the proposed reduction on sugar is admitted to be from twenty to twenty-five million dollars per annum. This particular loss of revenue is to be met by a revision of the tariff rates on rubber and manufactures of rubber in a most remarkable way—a way that the tariff tinker of 1893, if he is alive yet, will condemn himself for not having conceived and incorporated in the Wilson bill. In other words, the rubber manufacturers of this country are to receive a double Democratic blow. Not content with lowering the rates on rubber goods so as to encourage increased importations sufficient to raise a portion of the twenty million dollars, the Democrats propose to place a duty upon raw rubber which is now, and always has been, upon the free list.

If this reported plan proves unpopular or meets the disapproval or ridicule of the public press, then some other scheme will be resorted to in order to provide for the loss of revenue which will be caused by the reduction of the duty on sugar. Articles used by the American manufacturer, now on the free list and not produced in this country, are to be transferred from the free to the dutiable list, and at the same time the rate of duty on the manufactured article is to be reduced to any old rate which may be agreed upon by the Ways and Means Committee of the House.

These are but two of the twelve schedules which have to run the gauntlet of the Democratic House, with the ever-present thought of what is best to do in order to assist the Democratic candidate to the White House in the coming Presidential campaign. If the Democrats were in a position to give force and effect to their present tariff program, the balance of trade in our favor last year of nearly one-half a billion dollars would be wiped out and a bond issue would be in order immediately. But

that would be nothing unusual under a Democratic administration, when the laws are based on theory and the Government maintained in part on borrowed money.

The Democratic House, after having refused hearings to laboring men, manufacturers and every one interested directly or indirectly in the bill dealing with metals and manufactures thereof, pushed that measure to passage with little more than a day's consideration and debate, notwithstanding there are eighty-three distinct industries which produce goods included in this schedule. The public has been led to believe that the schedule relates almost exclusively to iron and steel, and if reductions were made they would affect only the Steel Trust. The truth is, there are in the United States about twenty-five thousand establishments producing articles covered by the iron and steel schedule. They have a capital invested of nearly four billion dollars, employ one and one-quarter million wage earners, who receive for their labors seven hundred and fifty million dollars in wages, and have an annual production of more than four billion dollars. And yet we find the future of these vast American industries turned over to a sub-committee for consideration and a determination of the rates of duty without granting a single person a chance to be heard as to what effect the proposed rates would have upon these American industries.

The chairman of this sub-committee, Hon. A. Mitchell Palmer, now serving his second term in Congress, in his opening remarks defending the measure, made this confession:

"I am not an expert upon the general tariff question, nor have I any other than the ordinary knowledge of that particular phase of the question which is involved in the discussion of the proper rates to be levied upon metals and the manufactures of metals."

Due credit should, however, be given to the expert knowledge of the Democratic members of that sub-committee, for it must not be forgotten that Congressman Dixon, of North Vernon, a village in Indiana, who is a lawyer by profession, was the other Democratic member of the sub-committee that revised the iron and steel schedule. I ask the American people if an industry of

such vast importance, having millions of stockholders, and employing a million and a quarter of wage earners, should be treated so flippantly. I do not hesitate to say that it is not a tariff bill for protection, or one for revenue only, but a tariff bill purely for political purposes. I do not believe the American people will be deceived or that confidence will be inspired in the Democratic party by any such actions.

Evidently, the manufacturers of this country are not the only ones to feel the blighting acts of Democracy, for in the naval appropriation bill a plan is proposed which, if carried out, will mean our early elimination as a sea power. The Democrats could have directed no more fatal blow at our navy than to abandon the battleship program which has put the American navy in the first rank of the world today. Our army also is to be weakened by cutting down the cavalry one-third, and at a time when the necessity of patrolling two thousand miles of border for an indefinite period makes a heavy demand upon our mounted service.

This is all done in the name of economy, but it is really for political use in the coming campaign. Hon. Champ Clark, in an article in *THE INDEPENDENT* of January 25, 1912, makes this statement:

"The tariff bills which we passed and which President Taft vetoed would have saved to the American people about five hundred millions of dollars and yet at the same time would have raised abundant revenue to support the Government."

The United States imported in the year 1911 \$750,981,697.04 worth of dutiable goods, yielding a revenue of \$309,581,943.65. The Democrats boldly claim that the rates of duty imposed in the bills passed by the Democratic House and vetoed by the President last session would have reduced the duties nearly one-half. If the revenues were to be increased, as claimed by the Democrats, or even maintained, the importations of foreign goods would have to be increased to double the amount imported today.

Can the American workingmen afford to have foreign labor employed in making these hundreds of millions of dollars' worth of goods in addition to what the foreigner is already making for the

American market, knowing that every dollar so made will displace a similar quantity of American-made goods? How will the American business man be benefited by having our laboring men idle and foreigners employed as they were under the Wilson bill? No country or its business institutions can be prosperous and have an army of unemployed men. Instead of five hundred million dollars being saved to the American people if the Democratic political tariff bills of last session had not been vetoed by the President, I maintain that that amount or more would have been lost to the American people if the President had signed those bills. The harassing of business for the last two years for political effect has cost the laboring men and the American people hundreds of millions of dollars. In the coming campaign, as a Republican, I welcome the issue between the two great parties, of protection to American labor and American industries.

The Speaker of the House also says the chief desire of the Democrats is to save to the taxpayer every dollar not necessary for the economical and effective administration of the Government. I wonder if it were for this purpose that the Sherwood pension bill was passed by the Democratic House, carrying an increase of pensions of nearly seventy-five million dollars per annum? I really believe that Democratic economy was not the motive in passing that pension bill. This belief was strengthened when Congressman Berger, of Wisconsin, the only Socialist member of the House, congratulated the Democratic party on having played successful politics in its passage.

When I recall that the "paramount" issues of the Democratic party have changed in every campaign since 1892, I am convinced that it will have a new one for 1912, hoping that all former paramounds will be forgotten and that the new issue will be sufficiently popular to carry the party.

The paramount issue of the Democratic party of 1896, under the leadership of the "peerless one," was the re-monetization of silver. Democratic orators told the farmer that if the issue of "sixteen to one" was successful he would

receive double price for his wheat, his cattle and all the products of his farm. The laboring man was to have his wage more than doubled. The storekeeper was to have his profits greatly increased. In fact, every commodity would be enhanced at least twofold in value. The millennium was promised to be close at hand. Democracy expected to come into her own by the adoption of the free silver theory. That paramount issue was not successful. Silver was not remonetized, nevertheless prices have advanced, but for other reasons than those ascribed by Democracy. Sixteen years ago Democracy was in sackcloth and ashes on account of low prices, and today she is again expressing pity for the poor American people, but this time because prices are too high. The promise made in 1896 was free silver and high prices; for 1912 it will be tariff for revenue only and low prices.

The three other paramount issues, beginning with imperialism in 1900, have also been relegated to the scrap pile.

Scarcely two years ago the Democrats of the House, with a few insurgent Republicans, had a spasm of reform; and on June 17, 1910, Mr. Clark, the present Speaker of the House, proposed a rule, which was adopted, taking from the Speaker of the House the right of arbitrary recognition on suspension days. The Speaker was stripped of his power, and it was claimed that this power was given back to the representatives of the people. This victory was heralded thru the newspapers and magazines, on the Chautauqua platform and on the stump. It was announced that a mighty achievement for the people had been accomplished thru the wonderful leadership of Mr. Clark. A few days ago Representative Henry, of Texas, chairman of the Committee on Rules, introduced into the House a proposition to amend the new Democratic rules. His amendment reclothes the present Speaker of the House with the power that was taken from Speaker Cannon on June 17, 1910.

By another new rule the Democrats have simply transferred the power of appointing committees from the Speaker to the chairman of the Ways and Means Committee. The chairman of this committee selects its members, and they in

turn name the members of all the other committees of the House. When the change is fully understood, my opinion is the American people will as soon have Cannonism of the North as Underwoodism of the South.

During the discussion of the tariff act of 1909, Mr. Clark and other leading Democrats of both the House of Representatives and the Senate pleaded for, insisted upon, and demanded the creation of a non-partisan Tariff Board which should gather the facts as to the difference in cost of production in this and foreign countries, so that Congress might act intelligently in revising the tariff in the future. So eager then were the Democrats to secure a "scientific" report on what they considered the most wicked schedule, that a leading Democrat offered an amendment in the Senate directing the Tariff Board to report on Schedule K (the wool schedule) by the first week in December, 1911. A unanimous report of the three Republican and two Democratic members of that board was made as directed. The Democratic Ways and Means Committee of the House has had this report in its possession for sixty days now, but I predict the Democratic party will ignore the Tariff Board's report and submit a wool bill to the House similar to the one it passed at the last session of Congress, when no Tariff Board report was available upon which to base a scientific revision.

I also expect to see the Democratic House refuse to make an appropriation for the continuance of the Tariff Board. Evidently the information gathered by the Tariff Board does not meet the approval of the Democratic leaders. Yet the great business organizations of this country have requested such a board, hoping that the information collected by it would be utilized in making future tariff changes. The National Tariff Commission Association obtained from President Taft permission to investigate the methods of the Tariff Board and in its report said:

"Our committee finds that the Tariff Board is composed of able, impartial, and earnest men who are devoting their energies unsparingly to the work before them; that the staff has been carefully selected for the work in view; is efficiently organized and directed,

and includes a number of exceptionally competent technical experts; that the scale of salaries is reasonable, indeed very moderate and all of their expenditures are closely scrutinized and equally reasonable; that the work of the board, vast and intricate in detail, is already highly organized, well systematized, running smoothly and that Congress and the people can now wait the completion of that work with entire confidence that it is progressing as rapidly as consistent with proper thoroughness and that it will amply justify all of the time and expense which it entails. We believe that the value of the work when completed will be so great and so evident as to leave remaining no doubt as to the expediency of maintaining it as a permanent function of the Government for the benefit of all the people."

The Tariff Board by its research has made the solution of the tariff problem a matter of scientific accuracy, but for so doing it may have to cease to exist because it has effectually exploded an issue the Democrats had expected to have for the coming fall election.

The Democratic party hopes to be successful at the next Presidential election on the theory that the American people endorse their present scheme of revising the tariff and that the people have forgotten that Democratic success means stagnation in business and idle men in every industry.

The Democrats believe that the Republican party is divided and that their

party is united. Yes, we see every day the unity, brotherly love, and the sincere friendship manifest among the leaders of the Democratic party. For instance, witness the love that exists between Woodrow Wilson and Marse Henry; the sincere friendship between William Jennings Bryan and Oscar W. Underwood; the neighborly feeling between Speaker Clark and Joseph W. Folk; the honeyed words with which Hobson, Hay and Fitzgerald are describing each other in the *Congressional Record*; the unity between the regular and insurgent Democrats of the Senate, with the latter in absolute control.

I cannot believe that the men who depend upon their daily wage for a livelihood, whether on the farm or in the factory, in the mill or in the mine, in the store or on the railroad, will vote to transfer the administration of the affairs of this Government to a party which has already demonstrated what it would do to our industries if it had the power.

Democratic success means the lowering of our standard of living; it means that our workingmen will be walking the street, while the foreigner will be busy and prosperous making goods for the American market.

WASHINGTON, D. C.

The St. John of Andrea del Sarto

BY ROBERT C. McMAHON

WHAT dost thou see beyond our mortal ken,
 O virgin lad with thy pellucid eyes?
 It cannot be the merriment of men,
 Nor see I there the look of wild surprise;
 And yet a heavenly vision surely lies.
 Before thee, lights thy lids, as rest
 The sun's last rays upon a mountain glen,
 And all the depths with mystery invest.
 Yea, thou art there, thy spirit forward flies
 Unconscious, unelated, truly blest;
 For thou art what thou willest; naught doth pen
 Thy spirit human frailty; hope ne'er dies
 In waking; for thy vision self-confest
 Was given to thee at divine behest.

FLORAL PARK, L. I.

Japan in 1911

BY DANIEL CROSBY GREENE

[For some years Dr. J. H. De Forest, a most competent authority, and long a missionary in Japan, has given us an annual survey of the notable events in the history of that empire. We are glad to give herewith a similar survey for the last year from the pen of Dr. Greene, who was a close associate of Dr. De Forest.—EDITOR.]

IT will be remembered that in the late Dr. De Forest's report of the year 1910 he referred to the impending trial of certain persons alleged to be guilty of a conspiracy against the Imperial family of Japan. The trial, before a specially constituted court, was conducted with closed doors, but many persons, including a number of lawyers unconnected with the case, and one or more members of the resident diplomatic corps, were allowed to be present. This procedure was much criticised, both by Japanese and foreigners; but it was in accord with the provisions of the Code of Criminal Procedure, which allows for such trials in cases which, in the opinion of the court, might otherwise exert an unfavorable influence upon public morals. Twenty-four persons were found guilty and sentenced to death; but the sentence of twelve of these was commuted to imprisonment for life.

Several of the defendants had been connected with Christian churches, and consequently in some quarters there arose a strong suspicion against the Christian community. For a time several prominent Christians were subjected to an annoying espionage, quite unreasonably, it would seem, since the leader of the conspirators, one of the so-called Christians, spent his last hours in writing a book embodying an argument against Christianity and the credibility of the Gospel story. This book has been widely circulated by the opponents of Christianity.

The Ministers of Education and of Home Affairs in the Cabinet of the day

looked this event sorely to heart. It would seem that they regarded it as an indication that the policy of a purely secular education, which had been diligently followed for many years, had failed. Accordingly, the common school teachers were exhorted to use their influence to foster the worship of the Shinto deities and the maintenance of the village shrines.

Many have seen, in all this, antagonism to Christianity; but some of the most influential of the educational authorities have denied any hostile intent. Still the form of the ministerial exhortations did in some country districts furnish the occasion for a decided opposition to the Sunday school work of the churches. In the larger towns, however, the Christians have won an independent position and they are well supported by a large body of what might be called adherents, who, while they may not often, perhaps never, attend public worship, have large sympathy with the Christian movement and contribute in various ways, directly or indirectly, to its support. The sum total of the benevolence of these adherents in behalf of various forms of charity under Christian leadership is very large, altho most of it fails to be recorded. The Christian movement has gained a momentum which renders all purely local or even national opposition relatively harmless. The only really serious obstacle in its path is the alleged decline of Christianity in the West and its failure to deal effectively with the great social evils which afflict America and Europe. Japan

is no longer leading a life of her own planning. She is caught in the tide which makes for unity in the spiritual and intellectual life of the civilized world. She cannot isolate herself, and seemingly adverse currents are but eddies upon the surface of a deep-flowing stream. The battle which the Christians of Japan must fight is in its essentials the same which confronts their compeers in the West.

The year has witnessed the revision of the treaties between Japan and the principal nations of the West. Those with France, Germany and Austria were approved in December. The special feature of the new treaties is the recognition of Japan's right to tariff autonomy and the control of her coasting trade. It is worth noting that as long ago as 1878, while William M. Evarts was Secretary of State and John A. Bingham the American Minister in Tokyo, a convention was concluded which was intended to provide for the full recognition of Japan's right of control in both these matters, in return for certain concessions; but much to Mr. Evarts's disappointment, a clause was inserted suspending the operation of the convention until similar agreements were arrived at with other Powers. This clause was due to a declaration on the part of the British representative in Tokyo that any concession made to any Power under specified conditions should accrue to British subjects irrespective of those conditions. Mr. Evarts felt that even at that early day Japan might have ventured to appeal to the public sentiment of the world against a policy so manifestly unjust; but the Japanese Government preferred to await a more favorable season. The American treaty was the first in the new series, and was published April 4. A treaty regulating the hunting of seal was also signed in Washington, December 14, by representatives of the United States, Great Britain, Japan and Russia. It is hoped that this agreement will enable these nations to work in harmony, for alleged irregularities on the part of Japanese seal hunters have been a fruitful source of irritation for many years.

The Katsura Ministry resigned August 25, and three days later Marquis

Saionji became Minister President. Marquis Saionji, tho the head of one of the old court noble families, had been the president of the *Seiyu Kwai*, the name given to the more moderate liberal party of Japan, since Marquis (later Prince) Ito's resignation from that post. He has been President of the Privy Council, and as such was three times Acting Prime Minister *ad interim*. He was also Minister President from January, 1900, to July, 1908. Marquis Saionji still retains the presidency of the *Seiyu Kwai* and has brought into his Cabinet three of his political associates, thus securing a nearer approach to a party ministry than Japan has seen before. The *Japan Times*, a paper owned and edited by Japanese, tho printed in English, recently stated that Prince Katsura himself had confessed that the bureaucratic system so far adhered to had failed. Whether this statement be quite correct or not, there is a large and growing number of thoughtful Japanese who believe that the British system is more consonant with the traditions of the Imperial house than the German system which they have hitherto essayed to copy.

One of the most noted features of this ministry lies in the fact that the treasury has been committed to Baron Yamamoto, for many years the Governor of the Bank of Japan. This means an earnest effort to secure an up-to-date business administration. The budget just submitted to the Diet shows the marks of the Baron's thoughtful purpose to curtail expenses so far as the national interests will allow.

The year just past has been on the whole not unprosperous. The crops were, it is true, not much if any above the average, but they have brought good prices. The volume of foreign trade was the largest in Japan's history, the exports amounting to Y. 447,000,000 and the imports to Y. 513,000,000; that is, a total of Y. 960,000,000. If the Korean trade be added, the total rises to Y. 1,018,000,000. Taxation is still high, but work is apparently abundant, and while the wages of the working people are low as compared with those of the same classes in America, they have risen greatly in the last few years.

An effort was made some years ago to

secure more efficient factory legislation, but the Diet rejected the Government's bill. Last winter a bill was passed by the Diet, but, while it does look toward an improvement in the condition of operatives, it is a sore disappointment to all interested in the welfare of the laboring classes. For example, the limit of hours for male operatives under fifteen years of age and of female operatives is placed at twelve hours a day, and they must not work between 10 p. m. and 4 a. m.; but even these provisions may be set aside under certain conditions, with the consent of the authorities, during the period of fifteen years from the enforcement of the present law. The careful provision for exceptional cases thruout the bill suggests the fear that even the small restraint put upon the millowners will not in practice prove a very important relief to the hardly worked boys and girls in the large factories which are springing up here and there thruout Japan. Still, it is a beginning, and may prove the germ of really efficient legislation.

In the sphere of religion there seems to be a broader outlook, and it is reported that a conference is to be held the coming spring, under government auspices, in which shall sit representatives of the Shinto, Buddhist and Christian faiths. There is room for useful co-operation in the direction of various much needed reforms. The information before the public does not warrant a more definite statement, but the prospect of a fuller recognition of Christianity as a result of the preliminary conferences would seem to be bright.

A large fund for the benefit of the sick poor has been established during the year under the inspiration of an imperial rescript, accompanied by a gift from the Emperor himself of Y. 1,500,000. The pledges amount to about Y. 25,000,000. Of this sum perhaps a fifth part is in cash, and the remainder is to be paid in ten annual instalments. Y. 3,000,000 are from the Iwasaki, Mitsui and Okura families. The intention is to use the income in establishing free hospitals and

in the distribution of tickets providing for free treatment at hospitals and by private practitioners.

The revolution in China has, as a matter of course, awakened great interest in Japan. In Government circles sympathy, it is understood, has been strongly in favor of a constitutional monarchy and consequently with Yuan Shi-kai; but outside those circles the revolutionists have received sympathetic support. Two distinguished professors of law, one from the Imperial University of Tokyo and one from Waseda University, have on invitation acted as advisers in drafting the constitution of the contemplated republic.

On first thought one is inclined to regard a constitutional monarchy as the true solution of the great problem before the Chinese people; but when the question arises, "Out of what materials?" the answer is not clear. The Manchu dynasty would seem to have become simply a source of irritation to the leading men of the majority of the provinces. There is no material in sight for the building up of a native dynasty, and the European plan of importing a king when the native stock fails is confessedly impracticable. Hence, in spite of the acknowledged drawbacks a republican government appears to be the only solution possible. It is claimed, too, by Japanese students of Chinese history that previous experience indicates that the Chinese people can and probably will readily adjust themselves to republican institutions; but the role of a prophet is a precarious one.

The past year will have an important place in the history of the Far East. The opening year promises to unroll before us a panorama of not less dramatic interest to all the world; but especially so to Japan, for in the birth of a new China she is above all other nations most deeply concerned. It must react profoundly upon her national life in many directions, and her statesmen are watching the progress of affairs across the narrow sea with hope, no doubt, but hope not unmingled with anxiety.

An Idyl for Old Folk

BY E. P. POWELL

AUTHOR OF "THE COUNTRY HOME," ETC.

ONE-THIRD the sky is an orange sunset; the pines, eighty feet tall, stand sober and worshipful. Two hundred years old, they are the Druids of the land. Gray mosses hang ten feet down from sixty feet above. Not a ripple of wind; no comment of Nature, as the months go rolling on. In the North March makes maple sugar. Here it makes orange blossoms and ripe mulberries. Marechal Niel roses are on my table, and the perfume blends with honeysuckle to crowd out that from the orange orchard just outside. A wide-spreading jasmine covers my study windows, with small white stars on twining arms of reddish green.

The latest cannas of 1911 meet the earliest cannas of 1912, and they blossom together; the heart of the old year throbbing with the heart of the new. A honey bee, sucking apples that came from the North till tipsy, has flown astray and into my door. Honey-maker! The world cannot spare one honest worker. I cautiously help him on his flight. This is a world of cooperative effort—everywhere. One must be blind not to see it, and dull not to feel it; and yet I hear that some of my neighbors are dining off robins. These feathered tourists are not idlers, either here or at their Northern home. It is pleasanter to know that the white herons are better protected, and just now I see half a dozen of them winging about my lake, or standing in the shallows, fishing. Alas, it is hard to tell just where this killing is permissible. Certainly we will protect our robins and egrets; and not discuss their dietary.

The loquat has been wantoning for four months; opening great bunches of deliciously perfumed flowers, as long ago as last October; it is just now swelling out with great bunches of medlars. What a fruit it is, a choice blending of a Bartlett pear with a Mayduke cherry. As it cannot bear fruit every month, it satisfies itself with producing blossoms

the rest of the time. Most wonderful of all, the Ponderosa lemon blossoms every month in the year, lengthens its branches every month, and sets a few of its massive fruits each month.

Nothing is stable; why should it be? One would not rob the years, each one of its right to create its own apples and oranges; only there must be improvement; always something better, and this is due not to the Burbanks and Hansens only, but to wild Nature herself. I do not care to have the years come back, nor to go back myself—neither one year nor fifty; and yet as I think of them, each one had its own charm, and was well worth the while; and now I have eighty of them, every one of them twelve months long and choke full of blackberries and milk, mothers' love, worth the while friendships, and expectations. I have great sympathy with Micawber. Had I no worries; have I no fears? Yes, I have them in plenty, as Coleridge had his ghosts—he saw so many of them that he did not believe in them. When a fret wakes me at midnight I dress him up in highest style, put on all his feathers, and then lie back and laugh at him. Once in a while, when one is likely to get the better of me, I hug him to death. But the cherry blossoms never fail, and the roses are not going to give up evolution. Away down in the far future there will be improved General Jacks, to cheer those children not yet born.

If you cannot sing, do not whine, nor groan—no, not in prayers even. Of all things on earth a prayer should be cheerful. Why else should you go to a "good" God, and a Father at that? If you cannot sing in your heart, and in your voice as well, it only shows that you are not keyed right. Why should we not have a moral tuner, as well as have one for our pianos only? If your Bible makes you happy, read it every day. But if not, try work—hoeing in the garden may be just what you need—for somehow our moral status is strangely

affected by our stomachs. Hoe until you are sweet and cheerful, and full of the spirit of self help and help for others—then hoe some more. Try the effect of paying your debts, or of saying good things about your neighbors. But to most people I say, Do what your hands and hearts find to do, and then shut up. That is blunt advice, but I have found it very useful with myself. There is too much tongue in the world.

The oranges in yonder orchard are all the work of 1911. The great cones on the pines, and the acorns that the blue-jays are puncturing on the oaks, they also are the products of 1911. Our property is the past; we have just got the old young year, and got him forever. It is in storage at last, and it belongs to us forever more. It is we ourselves only that are going on, and that is the wonderful part of it; we really do go on. It is because we only in all this crowd can be born over again. "Marvel not that I say unto you ye must be born again." This is the greatest of all truths concerning man, and it was ages ahead of us when Jesus found it out. It was pre-Darwinism two thousand years ago. Jesus was an evolutionist. What we owe Darwin in these later days is the unveiling of Jesus Christ; the scientific exposition of Christianity.

This rebirth offers itself continuously; and then again by periods. The boy is born over with adolescence, and then born again at the voting age. At forty we are told that every man becomes a physician or a fool; it is along there somewhere that he is likely to find out that he has defaulted in his body frame or in his moral habits, and needs a rebirth in both. At sixty or thereabout one comes to the decision whether he will just grow old, according to custom, and drop off; or will renew his life. This is the problem at every point; can you keep yourself flexible, or are you getting thru with yourself? Are you new every day, and a little newer, or are you just growing old; an old event that occurred forty or fifty or sixty years ago, without a new thought or a new capacity, and without a broader vision.

It always seemed a strange thing that we should live only just long enough to know how to live, and then die; genera-

tion after generation following the same lines. In this way our human customs and institutions are almost wholly left to the influence of the boyish and tentative period. Just as very few folk get ripe, so our institutions lack sweetness. It takes even a great man a long while to get any degree of common sense into his politics. There are cycles of guesses, there are repetitions of attempts. Fashions come round and round; and we find that even the hoop skirt is as sure as Halley's comet—likely to get here a little before female suffrage wins its majority. If we could link the next generation on somewhere, every time, at the sixties or seventies, instead of on at babyhood, there would be big gains for each century. We do not, however; we hitch the future to an uncertain childhood. This makes our gains slow; possibly all the better for the struggle. Yet we are a good hundred years ahead of Washington's generation, if they did fight the War for Independence. Taft and Bryce are working for world-wide peace and not for the hide-in-the-wilderness scheme of Washington and Jefferson.

There is a conceit abroad that old folk are behind the times, conservative, and slow to catch on with new ideas. There never was a greater blunder of judgment. The oldest friend I have, almost one hundred, is one of the most radical reformers that I know, and president of the most radical farmers' club. Not a big revolution has this world ever seen that was not led by old people, from Abraham and Confucius down to Gladstone. All the more reason, however, that the old comprehend themselves. The world is really theirs, not to stop its evolution, but to facilitate it. As the world grows older, oldness needs more and more to be displaced by life-fullness. Have you ever thought what Jesus meant when he said, "I came that ye might have more life." It is the stupid fact that there are so many dead people abroad, that makes most of the trouble—dead at forty or at fifty. They may not snuff out at that age, but in achievement are moribund. Their fire has gone down into the ashes. Poke the embers for a bit of heat, but not for a spark that will kindle a blaze. The other few

are the ones that are born again; keeping the sacred flame fed with enlarging purpose and life-fullness.

I am not quite sure on this point. I cannot quite get rid of the fact that the old have gone on growing 14½ bushels of corn to the acre, while the boys are beginning to show us how to grow 214 on the same map of ground. The World Scouts are boys, and they are showing us how to rescue knight errantry; the social honor and love that were liable to be destroyed by individual greed. Carnegie can give away grandly; but it is these corn-lot boys that are leading the way to a world of average plenty, and the new romance of being equally handsome and equally happy—and when "everybody" will be the topic of the next novel. A new age is just dawning, and you can look over the horizon already, where there are no Rotten Rows; no swollen cities full of disease and beggary, but a continent full of corn fields and cotton fields and cottages. President Schurman has uttered the wail over "the disheveled times"; but, as I see, there was never more God-love in our potato fields than there is today.

Seventy years ago my father showed me how to shell corn, by scraping it across the edge of a spade, lying across a half bushel with the handle on the floor. Sitting astraddle, we soon left the corn in the measure, and tossed the cobs aside. Then with the cobs he built me houses. They were not very stable, but they did not need to be in order to fill, and to fulfill, their purpose. I have learned since not to wish that anything be permanent; only that the fittest shall outlive the unfittest, and shall become the ruling idea everywhere else, as in architecture. And I am learning, too, that the fittest is that with the most honor in it—the preacher calls it love. All the same, love and honor alone are eternal, thanks be to God and to this human capacity for being born over; the flexibility of right manhood. I get tired of the word love, but not of duty. Love is only the blossom; duty is the plant itself. Do your plain duty, nothing else. Life is not a posy blossom. Water the roots; cultivate the plant; and let the flowers take care of themselves, as they surely will.

Human life is getting pretty well adjusted to flux. It was not a mere chance that made true, "Westward the star of empire takes its way." Race after race has chased its ideals. The Puritan stock was the result of migration. It became essentially progressive and wide-visioned as a consequence of not being allowed to settle down. It was always moving on. It looked for new things socially, and it got them; and looking for better politics it got better and broader religion. In America it bred a great race of Emersons and Whittiers and Lowells and Longfellows. Going across the continent it needfully let go of a fungoid faith. It is ready now for another age of sterling progress. Our boys of today will express a new power, moral and intellectual, that was never before known. Not only are bigotry and patriotism going out, but war. We are moving on, these old years that we own are full of our ventures and our lessons. 1912 is a sequence, as it will, by and by, be a precedence.

As I was leaving Missouri, an ex-Governor said to me, "You should never change your locality after you are forty," and I was near forty. I do not believe the Governor was right. I have lived since that in five different States, and in more than that number of houses—not built of cobs, yet I feel with Hawthorne that the worst thing about old Rome was that its houses were so nearly imperishable. I have heard the roar of the sea; and I have nestled in folds of moonlight, in my snug apple orchard; and now, at eighty, I am walking at sunrise where the bees are making honey of the superfluous orange nectar. Why not? If one can have a choice, let him have it; but let him not waste the life that he has with wishing for something else.

Yes, my mockingbird, I hear you on the ridgeboard; and I think you are telling me that migration is not altogether a mistake. It seems to me that what we want is more bigness; to get big enough; so big that we cannot change residence; so large in sentiment and in vision and in love that the whole world is home. My Missouri friend was right, only for the immensely important fact that a man can be born again—born

over several times. Jesus himself was born again, when He went up to the mount of far seeing. No one could have saved Phillips Brooks or Henry Ward Beecher who was not full-blooded. If you cannot be born over again, if you have not life enough for it, surely it is good advice for you to hide yourself at forty.

A change of environment is, you see, not necessarily a change of home; that is, if it be an enlarged environment. Nor is it changing home to live in another house or in another town; but to live into another religion, or another philosophy, or into another spiritual or intellectual atmosphere, that is changing home. The chief point is to keep track of yourself, so that the identity will not be lost, thru all the change. Am I the morning poet or the noon business man or the night good fellow? I have been puzzling myself lately to keep track of my political affiliations. I am not quite certain which party I belong to, or which church; and I am not sure that I care. In the affluence of splendid candidates what a pity we cannot try each one of them, rather than elect one, only to nag him down for the next four years. We have but one church in the town, but instead of uniting all the creeds that exist, it stands for only one, and there is no unity about it. Most of us are in the woods.

I have neighbors, whether in the North or in the South I will not tell, to whom a creed that takes in two or three of the old Councils of two thousand years ago is more important than creating a new sort of grape, or making the soil bring forth twice as much grain. To me the grape is more important. I do not care what Paul believed when he wrote the Epistle to the Ephesians; I want to know what he thinks about women speaking in meetings since the California election. The fine thing about Jesus is that His common sense was so complete. He knew the plants and the trees, and the animals and birds, and on the whole was what nowadays would pass for a progressive farmer. He had a poet's soul, and He had an eye all the time to lilies and wheat fields. On the

top of the mount Confucius and Lao tse and Buddha and Jesus stand together with God, in one group, and teach the same LIFE.

And "We alone." Yes, I said that. Is it conceit? I am troubled that "Togo," my loving and brave collie, my friend, has no chance. Has he nothing in this rebirth? Had he no conscious part in the past; in the long progress of canine improvement that preceded the collie? Rose petals lie all over the ground, and I can easily feel that the only future of the rose family lies in man's supervision and superwill. But "Togo" comes closer; almost to the individuality that insists on being born again. I planted him at the foot of an orange tree; and I am going on alone thru my rebirths. When they plant me at the roots of an apple tree I shall not be unable to go farther. It is this power of still changing, of growing, of expanding, of advancing, that demonstrates human immortality. "Togo" was complete with a single birth; I am not. "Marvel not that ye must be born again."

Socially also we are going thru with a series of rebirths. Ours is not the mankind nor the society that existed ten or five centuries ago. Even China faces around to the sun. The world to-day is inconceivably in advance of 1800. Our republic has been born over, and the rebirth we called a civil war. Social consciousness is becoming social conscientiousness; common sense is becoming conscience. Nowhere in America, today, is anybody being damned because he refuses to believe my creed or my candidate. Philanthropy is steadily and ruthlessly displacing patriotism. The old maxim was "To the Jew first, and also to the Gentile." Today we almost believe in human equality.

Well, well, I began with March. I intended to make some of the Florida music sing up there where the icicles jingle in the blasts, and where the folk grow weary waiting for hyacinths and dreaming of lilacs. And now where have we been, you and I? I do not care, so long as my idyll has done you no harm, and has made you my friend.

Local Fiction

GEOGRAPHICAL location has come to exercise an influence upon fiction little short of tyrannical. So fixed has become the public idea of the type of story befitting each separate locality that rare, indeed, is the author to whom it seems to occur to run counter to accepted tradition as to certain well known combinations of the time, the place and—above all—the girl, for the immutability of the feminine type peculiar to each section is an especially striking feature of modern fiction. But whichever sex may be depicted, it would be refreshing to meet an author who has discovered that the Bostonian is oftentimes slangy, the Westerner not infrequently sedate, that “the soft-voiced Southern woman” exists in fiction principally, and that the Englishman sometimes sees—and perpetrates—a joke.

Upon the whole, none of the following group of books shows any marked departure from the beaten track in the above respect, and, indeed, when one of them does depart at least from its author’s peculiar beaten path, the result is rather to tempt one to wish that she had not strayed. Not that, perhaps, the last one of Ruth McNery Stuart’s quartet of short stories¹ might not be considered a rather artistic chapter of revelation of a woman’s inmost soul, if it had come from another pen, but the very joy of her inimitable work in her earlier-chosen field causes a sense of disappointment when she so absolutely abandons it. Yet the other three stories are something of a disappointment too. As to location, they are just where we would have her abide—in the social circles of the “poor white” and the plantation negro—but both the fun and the paths fall something short of her accustomed spontaneity and whimsical charm.

Another Southern story, *Joyce of the Jasmines*,² is bright and most readable,

altho the New York lover, the Southern maiden and her uncle are precisely the same New Yorker and Southerner served up in every other novel of those localities. But the story moves rapidly and entertainingly, and there are occasionally shots at the idiosyncrasies of both sections which are not quite the same old thing.

A long flight it is from cotton fields and jasmine to the wheat fields of Manitoba, but at least it is very easy and inexpensive by the airship of the imagination, and *A Prairie Courtship*³ depicts the Canadian Northwest vividly enough greatly to facilitate the flight. The book strikes one at first as singularly devoid of literary arts and graces, as well as of very thrilling incident, compared with the average “Wild Western” novel, but at the close one is not sure that its author has not employed a considerable degree of art in a style and plot not unlike those vast Canadian plains themselves, which only seem monotonous before you have seen much of them. The experiences of a lone English girl, well born but impecunious, from the day she reaches Winnipeg with five dollars in her purse until she consents to be a farmer’s wife, are worth reading, and give one a fresh respect for the pluck and ability of the settlers of Western Canada.

Our mental aeroplane may well make one stop in the Middle West to break the long flight eastward again, and its point of descent will be “Friendship Village.”⁴ Miss Zona Gale has already made this community known to fame, and continues the account of its happenings and its strivings toward civic improvement, mainly thru the agency of the Friendship Married Ladies’ Cemetery Improvement Sodality. The scope of the sodality becomes considerably widened before the end of the book thru a succession of events, the foremost being the advent of a pathetic but amusing little waif abandoned by a drunken father, and wearing

¹THE HAUNTED PHOTOGRAPH. By Ruth McNery Stuart. New York: The Century Company. \$1.

²JOYCE OF THE JASMINES. By Ralph Henry Barbour. Philadelphia: J. B. Lippincott Company. \$2.

³A PRAIRIE COURTHSHIP. By Harold Bindloss. New York: Frederick A. Stokes Company. \$1.25.

⁴MOTHERS TO MEN. By Zona Gale. New York: Macmillan Company. \$1.50.

a pair of shoes of which he observes that "my biggest toe went right thru a hole, and it choked me awful." And a broad interest in the general welfare of the town might be expected of a sodality in which the prevailing sentiment was that "Anyway, we felt we'd ought to encourage self-made graves and not pauperize our corpses." We doubt that the residents of Middle Western villages uniformly speak an English so ungrammatical as that of Calliope Marsh and her neighbors, but aside from this the book is an entertaining picture of much to be found in such communities.

Flying east, we pause at New York to meet *The Moon Lady*,⁵ who resides there, tho the title suggests some residence less prosaic. Her story is the rather improbable one of a beautiful and brilliant auburn-haired mother, whose mastery by one deadly habit brings many complications into the course of true love between her son and his adored one. The story is not without some interest, however.

New England furnishes occasion for our longest pause, but we should not advise anyone, unless in time of absolute dearth of literary refreshment elsewhere, to linger long over *A Country Lawyer*⁶ or *The Love That Lives*.⁷ Both books contain an interminable length of uninteresting and unessential detail, and have a crudeness amazingly amateurish for authors with other books to their credit. *The Love That Lives* also defies all commonly accepted rules of punctuation, with results often so startling that we grieve that quotation is forbidden by lack of space. For a time the effect of this is rather exciting and tends to inspire interest if the book does not, but the monotony of meeting the vocative case *always* as guiltless of an enclosing fence of commas as the lawns of a spic-and-span Western town eventually palls—to excess.

May we digress here to say that a number of these books deepen a previous impression that a good many popular writers would do exceeding well to take

a few weeks off from creative activity and go to school to some old-fashioned teacher of English grammar? "Split infinitives," "like" as a prelude to nominative case and finite verb, "in" for "into," and similar violations of grammatical laws are not confined to passages meant for "dialect"; and the most gifted and best known writer in all this group apparently does not distinguish between "lay" and "lie."

*The Long Green Road*⁸ is very much the best of the three New England novels, altho it has a looseness of structure which makes the separate chapters better reading than the book as a whole. The various odd and interesting human specimens which greet the hero as he passes on the "long road" of an eventful life are most cleverly portrayed, but it is hard to see in what way many of them pertain to the plot—if one may say that the book *has* a plot.

*Awakening*⁹ demands of us a flight to which owners of material air craft have only aspired—across the Atlantic to sundry European scenes. The unusual theme of the love and marriage of a high-caste Hindu girl and a titled young Englishman, with the consequent shocks to and readjustment of the ideals of both, is well developed, but it would have been more effectively done in about half the space.

We have been trying to think of a fitting simile by way of excuse for including *The Amazing Adventures of Letitia Carberry*¹⁰ in this group of geographical books. Perhaps "*lucus a non lucendo*" suggests an analogy, since the adventures belong to no definitely named locality, except that they are distinctly of these United States. But if they had occurred in Patagonia, they would still be worth following. And one may suspect that Letitia would encounter amazing adventures there too—or on India's coral strands—if she saw fit to run her motor car thither. She is a brand-new and wholly delightful type of old maid in fiction, and we wish to amend our

⁵THE MOON LADY. By Helen Huntington. New York: Charles Scribner's Sons. \$1.25.

⁶A COUNTRY LAWYER. By Judge Henry J. Shute. Boston: Houghton Mifflin Company. \$1.25.

⁷THE LOVE THAT LIVES. By Mabel Osgood Wright. New York: Macmillan Company. \$1.30.

⁸THE LONG GREEN ROAD. By Sarah P. McLean Greene. New York: The Baker & Taylor Company. \$1.25.

¹⁰THE AMAZING ADVENTURES OF LETITIA CARBERRY. By Mary R. Rinchart. Indianapolis: Bobbs-Merrill Company. \$1.25.

opening remarks by the admission that if there is distressing lack of originality in heroines of North, South, East and West, there is found one here in the good State of Spinsterhood who is distinctly unique.

Modern Drama and Opera. A Reading List. Compiled by Clara (Mulliken) Norton, Frank K. Walter, Fanny Elsie Marquand. Boston: The Boston Book Co. \$1. (Bibliographies on D'Annunzio, Hauptmann, Ibsen, Jones, Maeterlinck, Phillips, Pinero, Rostand, Shaw, Sudermann, and Debussy, Puccini, Richard Strauss.)

In 1907, a very serviceable pamphlet by Clara A. Mulliken was issued. "Reading List on Modern Dramatists" was the title. It was a contribution offered by a student in the New York State Library School. With this as a foundation, a more pretentious book has just been published, the bibliographies having been increased by titles of importance appearing since 1907, and including the names of Pinero and Jones, in addition to the three composers. In its new form, the reading list is practical and handy. The compilations have been conscientiously made, and exhibit a wide acquaintance with the casual magazine literature of the subject. The 1911 edition is more complete than that of 1907 in the notation of editions, and opinions are more frequently quoted. The annotations are concise and suggestive, tho sometimes misleading. But there is no manifest principle of selection regarding magazine articles, and no careful discrimination between topics that have been digested, and the articles themselves. Under Ibsen we note the omission of several important articles by Archer, such as "Ibsen's Imperialism" (*Nineteenth Century*, 61:244-255), the oversight of Huneker's essay in "Iconoclasts," and no mention of Maeterlinck's estimate of Ibsen. Arthur Symons's articles are also passed over (see *Quarterly*, 205:375-397), and tho Mansfield's "Peer Gynt" received extended comment, such references have been cast aside. To show the rapid changes that take place in bibliographical matter, since this small book appeared "From Ibsen's Workshop" has been translated by A. G. Chater, and the definitive

Viking edition has started with the first four volumes. Such an important matter as Ibsen's consideration of the Saga (*Contemporary Review*, 90:318-331) has been ignored. Under Maeterlinck we find no reference to the fact that the Hovey translations have been transferred to Dodd, Mead & Co.; there is no mention of Harry's biography, either in its French or English form, and Huneker's brilliant essay in "Iconoclasts" is not included. Tho Faguet's excellent essay on "Symbolical Drama" was translated in the *International* (8:329-341), it is neglected; and the many accounts of the outdoor performances of "Pelleas et Mélisande" and "Macbeth" are absolutely ignored, even tho Madame Maeterlinck herself considered them. The compilers seem to be in ignorance of the article on Maeterlinck which appeared in THE INDEPENDENT May 4, and we do not see how any general reader could afford to ignore Van Bever's personal record of Maeterlinck, even tho it be in French. Too late to be included here there have appeared biographies on Maeterlinck by Edward Thomas and by Montrose J. Moses, together with Archibald Henderson's Boswellian account of Bernard Shaw. The latter's preface to the Brioux plays needs also to be noted in a later edition. These are merely hasty observations of matter omitted from this *Bibliography of Modern Drama and Opera*. But withal, it is useful and will serve the purposes of the average library and of reading clubs.

The Pilgrims of Iowa. By T. O. Douglass. 12mo, pp. xiv, 422. Boston: The Pilgrim Press. \$2.

All who are interested in the religious history of the West know of the "Iowa Band." They were eleven young graduates of Andover Theological Seminary who, in the fall of 1863, went by train to Buffalo, and from there by steamboat and prairie schooner to Iowa, to double the number of ministers, Presbyterian and Congregational, who had been the pioneers directed thither by the American Home Missionary Society, then supported by the two denominations. Mr. Douglass was not one of them, but he came early enough to know most of the pioneers, and, as secretary of the Iowa

Home Missionary Society for twenty-five years, he knew the churches of the State as well, and has been commissioned to write this very readable and trustworthy story of Congregationalism in Iowa; for, curiously enough, all the members of the Iowa Band chose to be Congregationalists. They gave character to the State as well as strength to their denomination. The volume is enriched by many portraits of the religious leaders whose lives are briefly given.

A Critical and Exegetical Commentary on Micah, Zephaniah, Nahum, Habakkuk, Obadiah and Joel. By John Merlin Powis Smith, Ph.D., William Hayes Ward, D.D., LL.D., Julius A. Bewer, Ph.D. 12mo, pp. xix, 363, 28, 146. New York: Charles Scribner's Sons. \$3.

This volume, which covers six of the Minor Prophets, is the latest of the admirable series called "The International Critical Commentary," edited by Professors Briggs and Driver and the Rev. Alfred Plummer. The series is well advanced in publication. Of the volumes, twenty-five are allotted to the Old Testament and nineteen to the New Testament, and twenty of the forty-four are already issued. They represent the best advance in biblical criticism and interpretation thus far given in English. The writers are American and English, those on the New Testament English mainly, and those on the Old Testament mainly American. In the present volume Micah, Zephaniah and Nahum are treated by Prof. J. M. P. Smith, of the University of Chicago; Habakkuk by Dr. William Hayes Ward, of THE INDEPENDENT; and Obadiah and Joel by Prof. Julius A. Bewer, of Union Theological Seminary. A main task of these authors is to secure as nearly as possible an original Hebrew text, which in not a few cases has suffered deformation at the hands of the earlier scribes. Then comes the work of the higher critic, who must study the date and single or composite authorship of the work, while the exegete will, on such a basis, interpret it. These volumes are not meant for edification; rather for the use of students of Scripture who can appreciate the problems involved; and the present volume is not behind the others in critical value.

One finds the conclusions of the authors after a full study of all the available sources.

Literary Notes

....A wealth of illustrations of biblical manners and customs from the observations of travelers in the Orient at the present time is to be found in the Rev. E. J. Hardy's *The Unvarying East* (Scribner).

....A useful means of keeping track of what is happening in any or all lines is the new monthly *Index to Dates of Current Events* published by R. R. Bowker Company, 298 Broadway, New York, at \$2 a year.

....A convenient and sensible handbook for treatment of minor ills and accidents is *Home Hygiene and Prevention of Disease*, by Dr. Norman E. Ditman (Duffield; \$1.50). It contains a great variety of information alphabetically arranged.

....An international *Who's Who in Science* has been compiled by H. H. Stephenson and published by Macmillan, at \$2. It includes addresses, list of chief publications and brief biographical data for over 4,000 men of science in all lands and also a convenient tabulation of the leading professors in the great universities of the world; altogether a valuable and time-saving work of reference.

....An unusually careful historical and social study of *Modern England* is that made by M. Louis Coziaman, lecturer in the Paris Sorbonne. (Dutton; \$1.50.) He discusses the political, artistic and intellectual movements of the times from an impartial standpoint and resists the temptation to exaggerate distinctions to produce striking effects. His conclusions are on the whole optimistic. He finds that the individualistic traditions of the Liberals do not prevent them from adopting new policies to meet changing economic needs and that pragmatism coming to the rescue of religion has given it new vitality and power over the modern mind.

....*Milestones*, a play by Arnold Bennett and Edward Knoblauch, was enthusiastically received last week in London at the Royalty Theater. This play by an American dramatist and an English novelist is described as an essay on three truisms, as follows: that human nature is human nature, that history repeats itself, and that self-sacrifice reacts upon the self-sacrificing. The drama deals with the fortunes of a family at three important epochs in its career: 1860, 1885 and 1912.

....From G. P. Putnam's Sons we receive four volumes of Molière's plays in the trans-

lation of Professor Curtis Hidden Page, issued now separately, as follows: *The Learned Ladies*; *The Hypocrite*; *The Tradesman Turned Gentleman*; *The Affected Misses* and *The Doctor by Compulsion* (\$1 each). The hackneyed Italian proverb of the translator being a traducer (see how it works out in translating the epigram!) comes to mind as we can these titles as substitutes for *Les Femmes Savantes*; *Tartuffe*; *Le Bourgeois Gentilhomme*; *Les Précieuses Ridicules*, and *Le Médecin malgré lui*. Above all does the inadequacy of "Affected Misses" for *Précieuses Ridicules* strike the reader. The texts are better than the titles, however. Did not Goethe say he re-read Molière annually in order to preserve a sane philosophy of life, and for other almost equally good reasons? Whatever the pretext, let us re-read Molière. In doing so, one will all the same turn with disgust from the emptiness of the contemporary stage. Never was there a time when more interest was taken in the stage by intelligent people and when the stage offered the public so poor an entertainment withal: or, if "never" is too flat a word, "well, hardly ever," as the captain of H. M. S. *Pinafore* used to say. When the Chicago players present Molière in Professor Page's translation one regrets the want of snap in the English version—but one is grateful to him all the same. He has enlarged Molière's visiting list.

....The first number of a new architectural journal, *The Architectural Quarterly of Harvard University*, is published this month. The purpose of the periodical is to make accessible important work by students, special lectures delivered in the school, and contributions by members of the teaching staff and graduates. The first number contains an illustrated paper on "Architectural Acoustics," by Professor W. C. Sabine, with a practical discussion of a number of recent theaters, lecture halls, and churches. The number also contains several drawings of important examples of European architecture and an essay on "The Mediaeval Town Halls of Italy." The annual subscription to the *Quarterly* is two dollars a year.

....Surely Mr. Merrick must have had stage experience of his own, in addition to his vision from the author's armchair in the wings, for many of his best short stories and several of his novels—among them *The Position of Peggy* (Kennerley; \$1.20)—have theater-folk for their heroes and heroines. But they are not stagey folk—these theater people; they are living beings. In innocent entertainment and sentiment without sentimentality, few novelists are Mr. Merrick's equals. He has imagination, humor, pathos, and a lightness of touch that is rare with English story-tellers, and is persistently suggestive of French mod-

els. The Peggy of his latest novel is a teath-er-brained and attractive young actress; the fiancé who is engaged to her so long but does not marry her is an impecunious Christopher Tatham, who fails as an actor and lacks enthusiasm for clerking, before he becomes a respected playwright. A most diverting tale.

Pebbles

DINER—I say, waiter! Remove this cheese quickly.

Waiter—Isnt it all right, sir?

Diner—Oh, quite all right; but it's eating my bread.—*New York Evening Mail*.

"PEOPLE nowadays," said the old house cat, "don't know how to raise children. They let the youngsters have their own way too much."

"That's right," replied the old brood hen. "Look at these chicks of mine. They wouldn't have amounted to a thing if they hadn't been sat upon."

APROPOS of Oscar Browning's memoirs, Brander Mathews recalls a clever epigram once written by a student on Professor Browning's increasing corpulency. It ran as follows:

O. B., oh, be obedient

To nature's stern decrees;

For though you be but one O. B.,

You may be too obese.

—*Catholic Fortnightly Review*.

THE ORANGEMAN'S CREED.

I am a loyalist: let no man doubt my loyalty.
I'll serve the King and honor him: do homage on my knees.

I'll be the firm defender and the champion of monarchy
As long as I'm allowed to do exactly as I please.

I am a patriot: no other man compares with me

In trumpeting the glory of the Mistress of the Seas.

I'll die—or talk of dying—to secure her power and liberty

As long as I'm allowed to do exactly as I please.

I am a legalist: I guard the law's authority.

I find my foremost duty in obeying its decrees.

I acknowledge all the sacred rights of liberty and property

As long as I'm allowed to do exactly as I please.

And loyalist and patriot and legalist I'll ever be

On this simple sole condition (surely no one disagrees):

That no man shall oppose me and that every man shall yield to me.

That I—but no one else—may do exactly as I please.

—*W. N. E., in Westminster Gazette*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, \$3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The Conquest of the South Pole

THE most famous match of might and wits and endurance the world has ever seen or will see is won, and the farthest end of the world has been reached and conquered. It was, in the brave Phenician myth of olden time, the Pillars of Hercules, where the Iberian cliff threatened the Mauretanian shore, that was the world's end; then, after lingering centuries, out from these same Spanish Straits sailed boldly the famed Italian to push the world's confines far across the untried waters and discover the new continent which in the beginning God had made to balance the old, and to teach the older nations great examples of liberty. Then hero vied with hero, nation with nation, to explore unknown lands and unvisited seas, until no portion of the round earth seemed unconquered except the two Poles, patrolled with icebergs and imprisoned behind invincible bars of night and cold. For a century rash men assailed the northern extreme, and many never returned, until, at last, one lucky and intrepid explorer achieved the world's upper extreme, "to the Dark Tower came," and returned to be ac-

claimed the victor in the world's greatest rivalry of conquests.

But there remained the Southern Pole, doubly fortified with mountains and glaciers. But the attack was bravely made by Lieutenant Shackleton, who just failed of reaching the goal; and next together started two runners in a mighty race, the Norwegian, Roald Amundsen, and the English Robert F. Scott, both well tried and brave. It was a fair start, an even match, and a mad but heedful rush across ice barriers, up mountain steepes two miles high, across crevasses, day after day in eternal winter's glint of frozen summer, until the final goal, the world's last goal, was reached. We know that Amundsen reached it, mighty victor, for he has hastened back to tell the great story, and we hope that Captain Scott also reached it, that the two may hold equal honors so long as the world gives its fair guerdon to courage and noble ambition. Thus in the Golden Age of Arcady, Daphnis and Damoetas contended in friendly rivalry for the meed of pastoral song and both bore away the prize.

And the praise of men is all the prize that one or both of these hardy explorers can win. No merchants will ever bear away ingots of gold from the glaciers of the Queen Maud Range, where only death lives, and Nature breeds nothing better than hurricanes of ice. Yet manly courage is a better product than the wealth that Spain brought back from Peru, and the fame of great deeds is a richer possession than escutcheons and estates. Amundsen honors Norway with the names of the sons of Norse sires spread over the southernmost zone, and his name will be held in endless honor from the utmost North to the furthest Polar South.

The Roosevelt Movement

MR. STIMSON, the Secretary of War, visited Mr. Roosevelt at Oyster Bay on January 7. Immediately thereafter he authorized the publication of the following statement:

"I am and have been for many years a close personal friend of Theodore Roosevelt and of William H. Taft, and I have never in the past found, and do not now find, it difficult in the

slightest degree to be loyal to both those friendships. I joined Mr. Taft's Cabinet after consultation with Col. Roosevelt and on Col. Roosevelt's advice. I have never believed that Col. Roosevelt would be a candidate against Mr. Taft, and, after talking with Col. Roosevelt today, I find no reason to change my mind."

There is some evidence that Mr. Roosevelt's determination to be a candidate was reached after this conversation with Secretary Stimson, because he became convinced that in this way he would satisfy an "overwhelming demand." In a letter sent to Frank A. Munsey on January 16, and recently given to the public by Mr. Roosevelt, he said:

"I shall not seek the nomination, nor would I accept it if it came to me as the result of an intrigue. But I will not tie my hands by a statement which would make it difficult or impossible for me to serve the public by undertaking a great task *if the people as a whole* seemed definitely to come to the conclusion that I ought to do that task. . . . If at this particular crisis the people feel that I am *the one man in sight to do the job*, then I should regard myself as shirking a plain duty if I refused to do it. . . . If the people should feel that I was *the instrument* to be used at this time, I should accept, even although I knew that I should be broken and cast aside in the using. . . . I have all along felt that even if there should be a strong popular demand for me, yet that unless *this demand were literally overwhelming* it could hardly make itself effective. But it seems to me that it is better that it should not make itself effective rather than that by any action of mine I should make it seem that I desire the Presidency for my own sake, or am willing to accept it unless it comes to me as the result of a *real popular movement*."

There should be "some tangible evidence" of this real popular movement, he added, before an announcement of his candidacy. A few days later the evidence seemed to him to be sufficient, and, as he said, he threw his hat into the ring.

We see no evidence that the "people as a whole" are calling for him and feel that he is "the one man in sight to do the job," altho his candidacy is by no means without support. Thus far there are no indications that a majority of the people in only one of the two great parties desire his nomination. Many who were his political friends have been repelled by his attempt to introduce a new issue and make it dominant. We refer, of course, to his advocacy of a recall of court decisions on constitutional questions by a majority vote at the polls.

What may take place hereafter we cannot say, but if Mr. Roosevelt thinks there has been shown, up to the present time, an overwhelming demand for him, he is misled.

There were two notable public addresses, last week, one by the President and the other by Secretary Stimson. Mr. Taft's subject was the proposed recall of court decisions, and what he said should be read by all who desire to be familiar with the objections to this revolutionary and reactionary proposition. No brief summary can do justice to this admirable statement. We quote a few words which were not strictly a part of the argument:

"I do not hesitate to say that it lays the ax at the root of the tree of well-ordered freedom, and subjects the guarantees of life, liberty and property without remedy to the fitful impulse of a temporary majority of our electorate. . . . What is the necessity of such a crude, revolutionary, fitful and unstable way of reversing judicial constructions of the Constitution? Why, if the construction is wrong, can it not be righted by Constitutional amendment. . . . Such a proposal as this is utterly without merit or utility, and, instead of being progressive, is reactionary; instead of being in the interest of all the people and of the stability of popular government, is sowing the seeds of confusion and tyranny."

But, aside from such characterizations of this proposition, Mr. Taft was courteous and complimentary in his references to Mr. Roosevelt. In a second speech he said:

"During the Administration of my distinguished predecessor, and by his appeals to Congress and to the public, the people and especially the business communities were aroused to the necessity of action [for the restraint of corporate and vested interests]. The great public benefit arising from this movement cannot be overestimated. It put the people on guard in every State and in every community."

Mr. Stimson, at the beginning of his address, said:

"I entered public life under the inspiration of Theodore Roosevelt. I am a firm believer in the great national policies for which he has fought. And I now remain his sincere friend. But I believe that those who are forcing him, contrary to his original intention, into the arena against Mr. Taft are jeopardizing instead of helping the real cause of progress in the nation. The introduction of such a contest at this time, dragging in, as it necessarily will, new and personal issues which are quite foreign to the great progressive policies for which the Republican party stands, cannot fail to weaken whichever candidate is eventually nominated in June."

We believe that Mr. Roosevelt's candidacy is injurious to the Progressive movement and that his nomination would be still more injurious both to that movement and to the Republican party. Even if that party were now united and harmonious, the prospect of success for it in November would not be highly encouraging. If it should now humiliate Mr. Taft by withholding from him that renomination which custom has given to a worthy President, and should name Mr. Roosevelt for his place, it would have a nominee asking the people to give him honor not given to Washington, Jefferson or Grant, and to say at the polls that now for the first time an American has been found worthy to serve in the White House for more than eight years. He would stand as the advocate of such treatment of judges and court decisions as he himself condemned when he said: "Savages do not like an independent and upright judiciary; they want the judge to decide their way, and if he does not they want to behead him." His conduct with respect to Mr. Taft would be counted against him by many who gladly voted for him in 1904. Only by a great blunder of the Democrats could he be successful. But the nomination of Mr. Bryan is not expected.

The Senate Amends the Peace Treaties

LAST Thursday the Senate of the United States ratified the peace treaties with England and France by a vote of 76 to 3, after making certain amendments the insistence on which is a public misfortune and a national humiliation. Twice before has our Upper House failed to meet the hopes of President and people in regard to arbitration.

Nevertheless the treaties as amended are considerably in advance of those treaties negotiated in 1908 and 1909 by Secretary Root with a score of our sister nations, in which "vital interests," "national honor" and the "interests of third parties" are reserved for the arbitrament of war.

In the present treaties "all differences" which are "justiciable" in nature are to be settled by arbitration, the only exceptions being questions which affect

"the admissions of aliens into the United States, or the admission of aliens to the educational institutions of the several States, or the territorial integrity of the several States or to the United States, or concerning the question of the alleged indebtedness or monied obligation of any State of the United States, or any question which depends upon or involves the maintenance of the traditional attitude of the United States concerning American questions, commonly described as the Monroe Doctrine, or other purely governmental policy."

As all these exceptions, save possibly that of the Monroe Doctrine, seem to be excluded from arbitration within the original terms of the treaty, and as it is quite inconceivable that England or France would ever desire to bring any of them into court, their incorporation into the treaty would seem as harmless as it is superfluous.

The only serious amendment is that which strikes out the clause in Article III, which gives the Joint High Commission power to decide whether a dispute is "justiciable" or not, and therefore to be arbitrated. But the Joint High Commission—the analog on an international scale of the grand jury of private law—remains intact, and much good will come from its investigations, and from its delays in publishing its findings, allowing that time may cool heated passions and reason may be restored.

The most humiliating feature of the Senate's action, however, is the fact that the vote was on strictly partisan lines, the Democrats and insurgent Republicans voting almost solidly for every emasculating amendment. This is the Democratic party's first great blunder in the present campaign. The insurgents seemed to follow the lead of Mr. Roosevelt, who used the full force of his great prestige against ratification, even accusing President Taft of "unctuous and odious hypocrisy."

We shall not go into a detailed discussion now of the arguments used in the Senate against the treaties. Neither do we advise Mr. Taft whether he should attempt to get England and France to accept them as amended, or to pigeonhole them until after the campaign, in the hope that an aroused and renewed pressure of public opinion will force the Senate to yield. Today we only emphasize the fact that the treaties as first drafted were to be binding upon

England and France just as much as upon us. Whatever dangers lurked in their ratification for us were equally unescapable for them. The simple truth is that England and France were not afraid to trust their honor to our safe keeping and sense of justice, while we were not civilized enough to meet them in the same spirit. The United States has, therefore, abdicated, for the present at least, its leadership in the peace movement of the world which it has held from the days of William Penn and Benjamin Franklin till now. Happily, however, the peace movement cannot be stopped, it can only be retarded. President Taft and Secretary Knox need not be discouraged. The enlightened sense of mankind is with them. All obstacles must eventually give way. In the meantime, let us accord them due honor for their noble endeavor for the abolition of war and the progress of civilization.

The Minimum Wage Problem

PUBLIC opinion in favor of a minimum wage, fixed by legally prescribed process and enforced by government, is steadily extending over a widening area. Minimum wage boards have been in operation in the State of Victoria, Australia, since 1896, and in Great Britain since January, 1910. The Legislature of Massachusetts in 1911 authorized the appointment of a commission to investigate the wages of women and minors, and to report on the advisability of establishing minimum wage boards in that commonwealth. The report of the commission was submitted to the Legislature in January. It presents a careful review of the whole problem, and recommends the creation of minimum wage boards.

Such State interference with "freedom of contract" would have been curiously condemned, less than a generation ago, as unconstitutional and a plain flying in the face of "political economy." It finds favor today with men whose knowledge of law and economics is, to say the least, not inferior to that of the jurists and teachers of a past generation, because conditions confront us now which will not bend to *a priori*

theory; conditions to which theory must adapt itself as best it may.

An appalling mass of human wreckage has been produced by the assumption that legal freedom of contract could be freedom of contract in fact when the parties to the bargain were respectively Might and Helplessness. Thanks to that assumption England finds herself today with a population so nearly unfit for military service that the mere suggestion of war almost causes panic. England has ground up more than raw materials in her mills. She has ground up her men and money. America has made a long start on England's road of folly, as the conditions at Lawrence, for example, bear witness.

The report of the Massachusetts Commission on Minimum Wage Boards presents supporting evidence not lightly to be brushed aside. The investigations recorded indicate that the number of wage-earning women in that commonwealth who are working merely to add to their comforts or luxuries is insignificant. "Women in general are working because of dire necessity, and in most cases the combined income of the family is not more than adequate to meet the families' cost of living." In general, woman's wage in Massachusetts is less than "a living wage." At the same time it is shown that in the same industry good wages are paid in certain establishments, while in competing establishments the low wages prevail which bring down the general average. The commission rightly argues that these facts prove exploitation by the low wage establishments, or incompetent management, and that, in any case, the industry which does not on the whole pay a living wage is parasitic, and of questionable social value. In the long run its costs fall on other industries, or on the community. That enlightened employers admit the soundness of this reasoning is shown by the circumstance that in Australia and in England competent employers do not object to the minimum wage laws, and usually welcome the "determinations" made by the minimum wage boards.

Persistent and powerful opposition to the proposed legislation will of course be made in Massachusetts and in other

States which may take up the idea. It will be as futile as opposition to child labor legislation, industrial insurance legislation, sanitary and tenement house legislation, and other policies, which an enlightened public opinion and a sturdier social conscience are bound to stand for. In the political economy of today there is no more fundamental principle than that every industry must meet its own costs, including the cost of maintaining its labor force in unimpaired health and efficiency.

A College of Religion

THERE has been an extraordinary development during the past generation in the courses of higher education in religion. A half century ago, and later, the denominational theological seminary, to educate ministers, was all there was, and was everywhere of one type. When fully equipt it had five professors: of Old Testament Hebrew, of New Testament Greek, of Church History, of Homiletics and of Dogmatic Theology. Of all these the chief and crown was the last, which was often frankly called Polemic Theology, and the students were known as "theologs." There was no provision for the instruction of any who did not plan to enter the ministerial profession.

Very different is the condition now. These five departments have been subdivided and others added to them in the clerical curriculum. The list of teachers in a leading theological seminary rises to fifteen or twenty, while a number of secondary schools, such as those founded by Mr. Moody, begin fitting young men and young women for positions as Sunday school teachers and religious workers in other ways. But just as our hundreds of normal schools called for a higher grade of normal colleges attached to our universities, so our theological seminaries have begun to attach to themselves departments of higher religious pedagogy to fit for the new professions in religious and social service, and for special training of ministers and young women who expect to engage in foreign or domestic mission work. We thus have colleges, or, rather, universities of religion.

While other theological seminaries are thus broadening out their work, we may take as an example Hartford Seminary, because of its large scheme and plans. It is not the only one, by any means, that now has a special department of foreign missions, but it will there be put on a firm and permanent basis, and attached to it is the School of Religious Pedagogy. The Hartford Theological Seminary itself needs no present further endowment, but for these two newer departments Mrs. John Stewart Kennedy has given \$250,000, and promised as much if a third \$250,000 is secured. Already one anonymous giver has offered \$100,000, and the remainder will doubtless be secured, and Mrs. Kennedy will give yet \$100,000 more for a building to house students. Beyond doubt gifts of land and buildings will raise the total immediate sum to \$1,000,000, and for a full endowment as much more is to be sought, and other departments are in mind. The plans provide that there shall be interdenominational schools—since polemic theology has gone out of fashion—for the training of young men and women not only for foreign missions, but for the new professions that have arisen during the last fifty years in Christian service and philanthropy, in the fields of religious education, social settlement work, charitable institutions, secretaryships in the Young Men's and Young Women's Christian Associations, as pastors' assistants and in music. There are thousands of men and women in these fields already, and thousands more will desire training of the most thoro sort.

We are learning—and it is taught us at home as well as abroad—that religion itself bears worthy fruit only as it is supported by the highest education. We are learning just now in both Turkey and China what education can do. It is the mission schools that are reforming or undermining the religions of India.

Over fifty years ago there arose the question about Boston whether the American Board was not wasting good missionary money in developing schools in the mission field of India instead of sticking to its first business of preaching the gospel. So the secretary of the board, Dr. Anderson, was sent to

India to investigate and report, as he was thought to be a very wise man. But he proved a very foolish man. He reported against the schools, and they were closed or reduced to mere primary rank. The result was disastrous, and it took a long while to restore the influence which was lost. A religion that is not backed by education will sink into superstition or worse. That lesson has now been learnt by all Christian statesmen, and the upheavals in Turkey, India, China and Japan have all been made possible by the increased number of young men whose education was fostered by these mission colleges. But we see that a Chicago denominational paper has forgotten, or never knew, what experience of a century has taught, and it is stirring up the churches to demand that the American Board should give up its higher institutions in foreign lands, and that the American Missionary Association should cease to press its Christian educational policy among the negroes of the South, on the plea that it is too great a burden on Congregational money to finance such colleges. It would have what money can be raised devoted to denominational church work, to organizing Congregational churches in cities and towns which are supplied with competing colored Methodist and colored Baptist churches. The one question to be considered is as to which method will have the larger influence for intelligence and Christianity among the masses of colored people. For our part we cannot approve the recrudescence of a long discarded and discredited theory of evangelism which would preach but not teach. The new movement teaches the teachers.

The Middleman in Science

WE hear much complaint nowadays of the middlemen in commerce. They are too numerous, it is said, there are too many links in the chain connecting producer with consumer. But in the scientific field the fault is quite the opposite. There are too few middlemen, not enough qualified persons engaged in the transmission of newly discovered truth to the masses. Writers of all sorts have multiplied amazingly and acquired unprecedented skill, with the exception of

writers of popular science. In this branch of literary art there is perhaps not an actual decline as compared with fifty years ago, but at least it may be safely said that it has not kept pace either with the advance of science or with the growth of scientific education.

There never was a time in the history of the world when scientific discoveries were so frequent or so sensational. There never was a time in the history of the world when so large a part of the population were educated to the point of understanding and appreciating such discoveries. Yet there is a widespread indifference, amounting sometimes to a positive aversion, on the part of the public, to a knowledge of the progress of science. Our literary magazines do not so commonly as formerly give space for a department devoted to science and invention. Once a theater might be filled with a fashionable and distinguished audience to see a watchspring burn in oxygen or a mouse perish for lack of it. Nowadays it is hard to get out a quorum for a demonstration of liquid air or radium. Recent discoveries in heredity are as startling and disconcerting to popular notions as gravitation or evolution, yet they attract little attention and arouse no heated controversies.

It is, of course, easiest to ascribe this popular indifference to the defects of our educational system. The schoolmaster has largely taken the place left vacant in our modern thought by the abdication of the devil. Teachers are nowadays held responsible for anything that goes wrong with either the individual or society. We shall not attempt here to relieve them of any part of the heavy burden of responsibility thrust upon them, for as a class they seem rather to enjoy it, perhaps because it is a tribute to their importance. But it seems to us unwarranted to assume that a distaste for science is due to the introduction of science into the curriculum, as it is also unwarranted to assume that the reason why people do not commonly read the English classics in after life is because they had to study them in the classroom. No; the difficulty is, in our opinion, due largely to the lack of a class of competent and zealous interpreters of scientific thought, and if our educational system is in any

degree responsible for this deficiency in our modern life, it is because it does not lay enough stress on training in the art of popular presentation.

Our universities cannot be expected to discover and train many Mendels or Galileos. The number of persons who can profitably devote their lives to research is relatively small in each generation, even tho it ought to be larger than it is now in this country. These professional investigators for the most part dislike to have people crowd around them and look over their shoulders as they work. We do not think it would hurt them so much as they think it would to give a popular exposition of their researches, but we recognize the fact that they are often incapable of making comprehensible to the lay mind the significance of what they are doing, and in any case it would not be profitable to take much of their time for this purpose from the labors for which they are peculiarly fitted. But here is a task, indeed a duty, for the large number of our graduates who have been trained in the method of science and inspired by its ideals and yet are not able, either for lack of genius or opportunity, to devote themselves to its advancement. They should constitute the middlemen of science, its spokesmen and popularizers. They might stand between the small group of research men, absorbed in their specialties, and the great mass of readers to whom the progress of science is of importance and would be of interest if pains were taken properly to present it to them.

It is not, of course, to be expected that people will follow with interest every step in routine of research, the steady, tedious march of the advance guard of science, ever onward into the unknown. But people are naturally interested in two features of scientific work, in its speculative and practical sides, its theories and its applications. In recent progress of the physical and biological sciences both these features have been present. The new theories are revolutionary and the new applications innumerable. The newspapers and magazines offer unprecedented opportunities for reaching the public, but these channels are insufficiently utilized. Occasionally a brilliant article appears in print

and proves that it is not impossible to be both accurate and popular. But for the most part editors have to sacrifice one or the other of these qualities when they publish a scientific article, and it is not to be wondered at that they often escape from the dilemma by ignoring the subject. But if our bachelors of science had a little more of the missionary spirit and a little more appreciation of popular needs and tastes the deficiency might readily be remedied.

The Case of Mr. Lewis We have received the following letter from the Attorney-General of the United States:

In *THE INDEPENDENT* for March 7th, I read a very satisfactory review of the controversy over the effort of the Executive Committee of the American Bar Association to eject Mr. William H. Lewis from membership on account of his color. There is one error, however, in the article, which states:

"The case is that of Assistant Attorney General William H. Lewis, whom Attorney General Wickham nominated for membership. . . ."

I did not nominate Mr. Lewis for membership. He was nominated by the local council for the State of Massachusetts, and elected by the Executive Committee in exact conformity with the by-laws. My first connection with the case was six months later, when, altho he had been a duly qualified member for that period, the Executive Committee undertook to oust him on the ground that the previous Executive Committee did not know that he was a colored man when, pursuant to the nomination of the Massachusetts Local Council, it elected him to membership. I enclose a copy of the circular letter which I sent to members of the association, and which sets forth the facts of the case.

The only significance of the error which has crept into your article is that it might give a general misapprehension to the public and look as though I were endeavoring to secure the election of some one whom I had nominated for membership—whereas, I had nothing whatever to do with bringing Mr. Lewis' name forward as a candidate for membership, and only took up his case when, without the slightest color of authority in the constitution or by-laws of the association, the Executive Committee undertook to throw him out.

GEO. W. WICKERHAM.

The accompanying circular letter fully and admirably presents the facts in the case, and makes it impossible for the Bar Association honorably to withdraw the election of Mr. Lewis, or, rather, to expel him from membership because of his fraction of negro blood.

The Columbia School of Journalism If the country were to be raked over for a man to be put at the head of the new School of Journalism founded at Columbia University by Mr. Pulitzer's liberality, not a more competent man could be found than Dr. Talcott Williams, who has been chosen for the position. He is the son of a distinguished missionary in Syria, was graduated from Amherst College in 1873, of which college he is a trustee, and, after experience in journalism in New York and Washington, became connected thirty years ago with the *Philadelphia Press*. His recreation is in Oriental study, particularly of Arabic, and he has published papers on the dialect of Morocco. As a publicist and orator he has achieved much distinction, and is a sound and competent writer on political and moral questions. It has sometimes been made a question whether journalism can be taught as a profession, or whether its scope is so wide that it includes all branches of knowledge, science, law, politics and religion. Dr. Williams belongs to that elder class of scholars who do not specialize narrowly, but have covered a broad field of study, and know how to find the results which specialists have reached. Professor Cunliffe, of the department of English in the University of Wisconsin, is to be the associate director, and he is one of the most successful teachers in that institution. Whatever special field there may be to train men for a profession whose field has no limits we may be sure these men will discover it, and we believe it will come to be one of the most popular departments of the university.

The Starling Again A reader of THE INDEPENDENT writes that he thinks we have been too severe in our judgment of the starling. Possibly we have, but all that we intended was a caution against the importation of new and very aggressive birds, for fear we get another English sparrow. This little scamp has a few friends, especially in the cities where he does scavenger work; but out in the grain fields he is an unmitigated curse. They are just as anxious in England to get rid of him as

we are here, and the government has a systematic method of scattering poisoned grain along the streets to destroy him. We cannot afford to entertain any more such possible angels in disguise, for he needs the whole continent to himself. Our friend writes us that he believes the starling eats no more fruit than the robin, and no more grain than the blackbird, and that he certainly has an unerring eye for cutworms. To compare him with the blackbirds does him no good whatever, at least among the farmers; for if we have one native bird that outdoes another in mischief it is the backbird. Any one who has undertaken to protect his corn field from a dozen blackbirds has had his hands full. They know when they are safest, and for that reason select Sunday for their best meal. The writer has chased them back and forth with guns and imprecations for two hours at a time, unfitting himself for church service, while the blackbirds simply went from one side of the field to the other, scoffing and laughing. As for robins, we have an instinct for favoring that bird, and making an exception of him, at the expense of every cherry we have, and our raspberries thrown in. Robin it is, and one would be only half a Yankee who did not quietly consent to let the redbreast have at least half he can grow. But when it comes to blackbirds and starlings, we are not quite so generous. If the starling eats cutworms let him have them, provided he will let the grain alone, and will not take the cherries away from the robins and dig into the tomatoes. We quite agree with the correspondent when he tells us that he enjoys the cheery whistle of the new bird all winter long, while the robin and catbird have gone South.

"One starling near us imitates the cry of a soaring hawk to perfection; another has made a catbird's cry its own; and they all remind us that we have one faithful bird friend who fully earns what he claims."

We certainly have a deal of sympathy with our friendly critic; we are not quite so sure about the starling.

Songs in English We hear a good deal nowadays about the singing of the songs of all nations in English. Now that the Metropolitan Opera House in New

York is putting on Professor Parker's "Mona," with an English libretto by Prof. Brian Hooker, perhaps we shall hear more of it. Singers have at least two excuses for not preferring English. Few of them have been trained to vocalize English vowels as they are spoken or to attack the consonants with any address; consequently they are neither comfortable nor distinct in their articulation of English. The second reason against an immediate general adoption of English on the operatic and concert stages lies in the fact that most English versions of foreign songs are unmusical and nonsensical. Here is a selection from the English libretto of Mozart's "Marriage of Figaro":

Darling vengeance! passion so dainty,
Banquet meet alone for sages;
Not to your injury's wages
Is a weakness both mean and base.
With discernment, cunning plenty,
Circumspection ne'er yet flouted,
I'll achieve it! the fact's undoubted."

Pen cannot highten or linotype improve upon the inanity of this version of a perfectly good lyric. In "Giaconda" we happen upon this tongue-twister, that might be adopted by worried wives as a test for husbands who return from the club after 11.30:

"Between twin tortures glistens
Thy porphyry ensanguined."

And many of the translations of the texts of songs are no better than these gems from the opera. The manly strength of German *lieder* is lost, even as the daintiness or sentiment of the French folk songs and the euphony of the Italian. Let us hope that we shall have better translations of foreign operas, ballads and lyrics before we are thrown upon English as the language of music.

Watson's Lament Did William Watson ever read Edmund Spenser's "Tears of the Muses"? He will there find more barrels of tears shed over the neglect of poetry, and that in the Elizabethan age, than he could draw gills of sympathy from the audiences to whom he has complained of the fact that "except for a certain vehement and voluble disciple of English imperial aggression, England's living singers have to content themselves

with a pecuniary compensation for their songs which would have seemed contemptible to Scott and Byron." Similar conditions, he said, prevail in this country. He complained that motoring and aeroplaning and social life and business take up energy that ought to be spared for literary art; and that, worst of all, there is the awful critic, an interloper between the poet and his readers. And then the novel! People will not read a poem if they can bury themselves in a novel. Mr. Watson at least admits that Mr. Kipling is a poet, only he does not like Kipling's subjects. We had poets that made a good living at their art a few years ago, and if he could only give us a few now of their rank we believe the people would appreciate them. In the old days Spenser complained of the neglect of titled patrons, and now Mr. Watson is shocked because no poet, and only one novelist, was officially invited to the Coronation of King Edward. The Muses are not attractive with handkerchiefs to their weeping eyes; let them earn their fame and food; and if their output lacks quality let them submit, as our grocers and druggists do, to the Dr. Wileys of the critical press.

Divorce Denied No one need be grieved that Count Boni de Castellane has been refused by the Papal Court an ecclesiastical divorce from his wife, who was Anna Gould, and is now the Duchess of Talleyrand Perigord. These titles do not count anything in the French Republic, however they may in aristocratic French society. The lady got a divorce from the French courts, and it was abundantly justified, and no one need waste any sympathy on the Count. The Church of Rome has its own laws, and has as much right to stick to them in her own domain as has a mercantile company or an oath-bound fraternity. It is very agreeable to observe that money has not purchased a dispensation for Count Boni to marry some other woman whom he can make unhappy. It has often been charged that money will buy anything at Rome, and the report is as old as Chaucer; but here is a case where it has failed. And yet the petitioner has appealed to a higher ecclesiastical court, with little chance of success, we presume.

Just now Americans visiting Italy, or sailing on Italian steamers, get a clear notion of the Italian point of view. Everywhere the war with Turkey is on the carpet. Like one man, those Italians see in the possession of Tripoli a source of wealth. There is no word of civilizing the Arabs; nothing of imparting the blessings of the Gospel to benighted heathen; nothing of uplifting humanity—only the bare statement that Tripoli will prove an Eldorado. On all sides, in bill posters, in the daily press, are similar statements; only made in the shape of various promoter's schemes—railways in Tripoli; steamship lines from Italian ports to Tripolitan; mining schemes. Maps even are published in the newspapers which divide off the conquered country into zones, viz., colonizing, agricultural, mining, and so on. The Italian heart is enthusiastic over the certainty that Italy will now, by means of the wealth flowing in from Tripoli, take her rightful place; that is, the old dream of the Roman Empire is before the eyes of the sons of the Cæsars.

It is a good story told of President Lowell, of Harvard University, who the other day came upon a herd of cattle being driven thru the streets to the abattoir, and when his dog, held by a leash, was attacked by a vicious looking bull, he stood his ground and beat the bull back by blows on its nose with his heavy walking stick. We will not be responsible for the implied fact that bull beef is marketed in Cambridge, but the story is supported by an older tale of a party of visitors driven from an English meadow by a vicious bull, whereupon the farmer walked up to the bull, beat it over the nose with his stick, and said, "Folk mek too much of bulls these days."

We do not know and do not care what Mr. J. P. Morgan paid for the Coptic manuscripts which formed the library of an ancient Egyptian convent, but the effort to show that they were not worth what he paid for them doubtless comes from some envious people who know nothing of the real value of these unique manuscripts which we have described. They have no essential value to Arabs, but are of very great value for biblical

scholarship, and whatever he paid for these fifty-seven volumes we are very glad they are in this country and that Professor Hyvernât is editing them.

Esperanto has seemed to us a harmless amusement, but we are enlightened, for we learn from the published proceedings of an Anti-Masonic Congress in Paris that Esperanto is a device of the infidel Free Masons of Europe to break down nationalities and God-created languages and overthrow the Church, whose common language is Latin. Esperanto was invented by a Jewish Free Mason, and in Rumania all the students of the new tongue are Jews. We henceforth transfer all our scant interest to the rival Ido, which was invented by Ostwald, who is not a Jew.

We do not take very much stock in the report that the farmers of Western Canada are so angry over the defeat of reciprocity by Eastern Canada that they threaten to secede and set up a separate Canada of their own. It will be easier to correct the hasty error, if our Western farmers do not object, as Mr. Roosevelt thinks they properly may.

Now, in Montenegro, emigrants who have returned from the United States are at the bottom of the movement to create a republic. In the late elections in Germany such voters displayed American flags and voted well the advanced parties. It is just so in Italy, in China, and over the world.

If the story is half true of the excavating of a new quarter in Pompeii composed of shops, we shall find very valuable archeological treasures. But what we more want is the excavating of the richer city of Herculaneum, which Italy is too poor to attempt, while she refuses to allow the work to be done by other nations.

Coincident with our publishing an editorial on the prevalence of pellagra, the United States Health Reports gave the description of over three hundred cases in South Carolina, where five years ago no one suspected the prevalence of a single case.

INSURANCE

Regulating Liability Expenses

THERE is a bill now pending in the Legislature of New York amendatory of the law regulating the transaction of liability insurance. The main object of the amendment is to limit the expense at which that business is done. The measure comes before the Legislature on the recommendation of former Superintendent Hotchkiss.

It is eminently proper and entirely consistent with the duty of legislators that the members of mutual insurance companies of all kinds be protected against the consequences of extravagant managements in their efforts to develop business, for all such burdens must eventually fall on the shoulders of the members, there being no one else to bear them. But this is not true of joint stock corporations. Their stockholders are held to strict accountability by the State. They must maintain ample reserves for every liability, immediate and contingent. They dare not impair their capital without inflicting grave injury on the very interests they are endeavoring to advance. When their reserves fall below the limitations set by law, stockholders are compelled to go into their pockets and make them good.

It is therefore not astonishing to learn that one of the large stock companies which is writing liability insurance—a company with over a hundred millions in assets and about ten millions of surplus—is opposed to the amendment. As a competitor for the class of business affected by the proposed law, it regards such a regulation as a clog on its enterprise and it cannot understand why the State should endeavor to prevent it from spending its own money in the legitimate development of its business.

The limitation of expense proposed in the bill is based on a percentage of the premium income. That is to say, a company will not be permitted to disburse for agents' commissions, management expenses, etc., a sum in excess of thirty-two and a half per cent. of its premiums. Now, how is a company to know in advance what the aggregate of its premium income is to be? May it not, for numerous reasons, fall short of the best cal-

culations it makes? These are questions which the company alluded to asks. In the case of companies writing multiple lines of insurance, as all casualty companies do—personal accident and health, liability, burglary, plate glass, fly wheel, sprinkler leakage, and others—how is an expense limitation based on a percentage of liability premiums only to be applied in cases where the service handles all the various lines the company writes? Then again, such a law in New York would place all the companies subject to it at a great disadvantage in the competitive field at large—in States, for example, where there was no such law in force. Companies in those States not doing business in New York would be unfettered as to expenses and could offer better terms to agents and brokers.

In short, it would seem that, as applied to joint stock insurance companies, such a law as the one proposed would have the effect of reducing competition and throttling corporate enterprise. No company engaged in transacting a legitimate business, and doing it in an upright manner, should be denied the right of investing its own money in establishing or enlarging its plant, and in developing its business. If its proprietors, the stockholders, are willing to forego all or any profits accruing from their trade income in furtherance of these objects, no one else should object.

The subject does not seem to be one for State regulation. Underwriters engaged in liability insurance are doubtless of the opinion that their expenses are too large. If that is true they should get together and reduce them. The task is one which properly falls to them, not to the State.

THE fire losses in the United States and Canada for February amount to \$28,601,650, and the total losses since January 1 to \$64,255,100, which is nearly \$27,000,000 more than the losses for the first two months of 1911. William B. Clark, an experienced underwriter and for twenty years president of the Aetna Insurance Company of Hartford, says that last month's losses were the heaviest for February since the Baltimore conflagration.

FINANCIAL

Railroad Rates and Wages

THE unsuccessful application of the railroad companies for permission to increase freight rates was made mainly upon the ground that expenses had been largely increased by grants of higher wages. Figures relating to the cost of higher wages are published by the Bureau of Railway Economics. Wages paid in the fiscal year ending with June last amounted to \$1,005,277,249, which exceeded by \$41,868,822 the sum which the wage rates of the preceding year would have required, and by \$69,297,678 the amount which would have been called for by the wage rates of 1909. In 1911, with 2,108 more miles of road, the number of employees was reduced by 31,037. With a slight increase of gross revenue, net earnings were less by \$40,988,539. In the calendar year which ended with December last, however, according to returns compiled by the *Financial Chronicle*, gross revenue showed a decrease of \$30,024,000, and the comparative loss of net earnings was \$24,288,000, or about 3 per cent. This decrease of gross revenue followed increases of \$239,000,000 in 1910 and \$282,000,000 in 1909, these changes marking revival from the panic depression of 1908. It was reported last week that the movement of engineers for a further increase of pay had suggested to the companies another application to the commission for permission to raise freight rates. The president of the New York Central said he had heard of no intention to apply again, altho an increase of expenses would make it necessary to add something to freight charges.

New President of Liberty National Bank

SEWARD PROSSER, formerly vice-president of the Astor Trust Company of this city, was recently elected president of the Liberty National Bank to succeed Frededick B. Schenck, who resigned to become chairman of the board. Mr. Prosser was born in Buffalo in 1872, attended a public school in Brooklyn, and when

fourteen moved to Englewood, N. J. For ten years he was with the Provident Savings Life Assurance Society, and for the next ten or eleven years was in the employ of the Equitable Life in this city. In 1907, at the organization of the Astor Trust Company, he became its vice-president. Mr. Prosser is still a director and one of the executive committee of the Astor Trust Company and is also a director of the Astor Safe Deposit Company, the Mercantile Safe Deposit Company and the Bankers Trust Company.

The Liberty National Bank was organized in 1891 with a capital of \$500,000, which was increased ten years later to \$1,000,000. Dividends at the rate of 25 per cent. per annum have been paid during the past few years. In addition to its capital of \$1,000,000, the surplus and undivided profits now amount to \$2,741,571, the deposits to \$22,405,084, and the total resources to \$26,636,355. Mr. Schenck was elected president in 1907. Other presidents have been Henry C. Tinker, Henry P. Davison and E. C. Converse. The vice-presidents are Daniel G. Reid, of the Rock Island Road, and Zoheth S. Freeman, who was formerly vice-president of the Merchants National Bank. Charles W. Riecks is likewise vice-president as well as cashier. He was the paying teller when the bank was organized twenty-one years ago.

....According to reports of the Canadian Labor Department the cost of living in the Dominion now has an index number of 131, to which it has risen from the standard of 100, fixed in 1890.

....In the United States 717,875 automobiles are registered. Allowance being made for duplications, it is estimated that about 677,000 are in use. For registration fees \$3,985,848 was paid in 1911.

....It is announced at Newburgh, N. Y., where the official appraisal is nearing completion, that the value of the late Edward H. Harriman's estate is about \$100,000,000. The transfer tax will be in the neighborhood of \$1,000,000.

The Independent

VOL. LXXII NEW YORK, THURSDAY, MARCH 28, 1912

No. 3304

Survey of the World

Bills Before Congress The Democratic excise tax bill was passed by the House of Representatives, March 19, by a vote of 252 to 40. The 40 were all Republicans, but twice as many members of the minority voted aye on the final call. It is now the Senate's duty to pass upon the measure, which is expected to make up for the reduction in customs receipts if the free sugar bill becomes law.—Chairman Underwood, of the Ways and Means Committee, opposes free wool because he thinks the revenue loss, about \$21,000,000, could not be raised by putting a duty on raw silk and raw rubber, as is proposed. On March 21 he introduced a bill providing for a duty of 20 per cent. on raw wool; a 50 per cent. reduction. The new bill is approximately the same as that passed by House and Senate at the last session, and vetoed by the President, whose chief objection was that there had not then been a report on the subject from the tariff board. Last summer's bill originally carried a 20 per cent. duty, but this was raised to 29 per cent. in order to secure passage by the Senate. The duty on combed wool is set at 25 per cent. by the new bill. The duty on yarns, knit fabrics, blankets, flannels, braids, carpets, etc., varies from 30 to 45 per cent. The Republican members of the Ways and Means Committee introduced a bill of their own on March 22. This is framed in accordance with their interpretation of the report of the tariff board. The Republican bill reduces the duties on wool and manufactures of wool about 40 per cent., and the duty on raw wool is about 35 per cent.—Further trust legislation

is necessary, in the opinion of the Senate Committee on Interstate Commerce. A bill to meet objections to the Sherman law, and to strengthen it, is being drafted.—Senator Cummins introduced on March 18 a nation-wide Presidential primary bill.

The Democrats The Democrats of Maine held their State convention on March 19, to select delegates to the national convention. Senator Johnson presided. Maine never instructs her delegates, but seven of her twelve votes are claimed for Governor Wilson. Wilson workers allege that there is an understanding between the Harmon, Underwood and Clark forces by which their issues are pooled against Governor Wilson. The Hearst newspapers have quoted from the New Jersey historian's book on "The American People" passages criticising the quality of our immigrants, especially those from Poland, Hungary and Italy. New York newspapers published in Hungarian and Italian have communicated with Governor Wilson on the subject, and his explanations have been accepted. Dr. Wilson has himself denied the assertion that he did not vote for Bryan in 1908 and was consequently not a regular Democrat. Mr. Bryan said at the banquet at Lincoln, Neb., to celebrate his fifty-second birthday (March 19):

"I have purposely avoided expressing any preference among the candidates of the Democracy for President. . . . I want the party to tell me whom it wants and not to ask me to tell it whom to choose. What I know is that there are many Democrats who can poll more votes now than I can. Give me a

progressive to fight for and I will show you how well I can fight."

The banqueters, who represented every section of the country, passed resolutions naming Governor Wilson as their first choice, Champ Clark as their second choice, for President.—The Indiana delegation to the Baltimore convention has twenty-six votes, which will be cast on the first ballot for Governor Marshall, of Indiana, who asserts that "there is but slight demand for the initiative, referendum and recall."

Mr. Roosevelt's "Fundamentals" The most sensational political speech of the week was Mr. Roosevelt's, delivered in Carnegie Hall, New York, March 20. The ex-President told a big audience that

"The great fundamental . . . issue is, Are the American people fit to govern themselves, to rule themselves, to control themselves? I believe they are. My opponents do not. . . . I have scant patience with this talk of the tyranny of the majority. Whenever there is tyranny of the majority I shall protest against it with all my heart and soul. But we are today suffering from the tyranny of minorities. . . .

"I do not advocate the recall of judges in all States and in all communities. . . . I am not proposing anything in connection with the Supreme Court of the United States or with the Federal Constitution. I am not proposing anything having any connection with ordinary suits, civil or criminal, as between individuals. . . . I am proposing merely that in a certain class of cases involving the police power, when a State court has set aside as unconstitutional a law passed by the Legislature for the general welfare, the question of the validity of the law . . . be submitted for final determination to a vote of the people."

Mr. Taft's criticism of the proposal to recall unpopular judicial decisions is, said Mr. Roosevelt,

"less a criticism of my proposal than a criticism of all popular government. . . . How can the prevailing morality or a preponderant opinion be better and more exactly ascertained than by a vote of the people? . . . Mr. Taft fairly defines the issue when he says that our Government is and should be a government of all the people by a representative part of the people. This is an excellent and moderate definition of an oligarchy. . . . I prefer to work with moderate, with rational conservatives, . . . but when they halt and turn their backs to the light, and sit with the scorners on the seats of reaction, then I must part company with them. We, the people, cannot turn back."

On Friday evening the New York Republican Club indorsed Mr. Taft and by a unanimous vote denounced the new Roosevelt program. On Saturday, Mr. Roosevelt told an audience at Portland, Me., that Mr. Taft's scheme of government "would be a government of the people, for the people, by the bosses." The stage from which he spoke collapsed, but he was uninjured. "The platform broke down," he said, "but it wasn't our platform." A Democratic representative asked consent of the Maine House of Representatives to introduce a resolution:

"Whereas Colonel Roosevelt casts his hat into the presidential ring, and is a candidate for a third presidential term,"

etc., be it resolved that he be invited to address the Legislature at Augusta. The resolution was objected to. Mr. Roosevelt is now stumping the Middle West. It is the plan of his managers to contest the right of many of the Taft delegates to take their places at the Chicago convention.

The Republican Situation

Rumors of a movement to nominate Justice Hughes, of the Supreme Court, as a compromise candidate for President have connected William Barnes, of Albany, and Senator Penrose, of Pennsylvania, with the project. But Justice Hughes has reiterated his statement that he is not a candidate, and forbids the use of his name against Mr. Taft. The last week has been marked by Senator La Follette's characterization of Mr. Roosevelt's supporters as "soft-shelled progressives," and by his return to Washington, apparently restored in health and ready to work hard in his own cause. Tho it is impossible seriously to regard his Presidential chances, the Wisconsin Senator won a great victory in the North Dakota primaries, held March 19. By more than thirteen thousand votes he triumphed over Mr. Roosevelt, while the President scarcely figured in the count at all. The total vote cast in the Republican preferential primaries, the first to be held in the State, was about 48,000. In Wisconsin, Mr. Roosevelt is not making a contest for

delegates.—Mr. Taft now has ten delegates from Iowa; Senator Cummins, two. Mr. Taft has the six Hawaii delegates.—The President visited Boston last week, as also Nashua, Concord and Manchester, N. H. At Concord, "all the Administration wants is a square deal," he said, and was heartily cheered. The President's great effort was, however, his Boston State House speech, delivered on Evacuation Day. Mr. Taft has rarely spoken with such earnestness, or made so deep an impression upon an audience. All day he was the object of a warm demonstration, which his opponents say was given him by Democrats. Mr. Taft address the Legislature on the recall and the preferential Presidential primary, which he favors

"wherever full and fair notice of the election can be given; wherever adequate election safeguards can be thrown around to protect it; wherever the Constitution of the State permits it being made applicable to the present election."

This was the President's first personal reply to the challenge of Mr. Roosevelt's manager, Senator Dixon. He added that

"a volunteer primary outside the law—known for its informal character as a 'soap-box' primary—is worse than none,"

opening the way to fraud and violence. (Mr. Roosevelt has issued a statement expressing gratification at the President's position, and the hope that he will support primary legislation now before various State legislatures.) The President said, in the course of his Boston speech:

"This is a government based on popular control. We all concede that the operation of elections and the operations of government are not perfect . . . and that it is the part of patriotism to remove, as far as possible, the obstacles which prevent honest primaries, honest elections, and the honest administration of the government in the interest of the people, but the continued iteration and reiteration of the proposition, 'let the people rule,' if it has any significance at all and is intended otherwise than to flatter the people, is intended to be a reflection on the Government that we have had down to the present time.

"Now, in spite of all the corruption, in spite of all the machine politics, in spite of every defect in the operation of our government that can be pointed out, I do not hesitate to say that the history of the last one hundred and thirty-five years shows that the people have ruled."

Faint hopes of an escape from the expected coal strike on April 1 are held out, as we go to press, in the possibility of compromise at the joint conference of United Mine Workers and operators, scheduled for March 26 at Cleveland, and the probable passage by the House of Representatives of the Lee bill, amending the Erdman arbitration act. This bill would make possible Federal conciliation before an actual break occurs.—Hearings have been held by the House Committee on Labor on the Hughes-Borah bill to create a Commission on Industrial Relations, which John Mitchell declares to be "the next step necessary in obtaining a just industrial peace."—A Federal inquiry into an alleged "coal trust" is said to be in progress. So far it has proceeded no farther than the collection of evidence.—Several big Rhode Island textile mills have posted orders advancing wages, about 5 per cent., beginning this week. About 35,000 workers are affected. The Fall River mills have increased their advances from 5 to 10 per cent. and the union men have voted to accept this increase, tho they demanded 15 per cent. at first. The price of print cloths will be advanced to meet the increased cost of manufacture. Meanwhile, there have been declared strikes at the gingham mills at Clinton, Mass., and elsewhere in New England, as also at silk and worsted mills in Hudson County, N. J. Machine stitchers in the shoe shops of Lynn, Mass., demand an increase of wages. The firemen of the Lawrence mills have gone out, but the mills are in operation again. The strike at Barre, Vt., has come to an end, a compromise having been agreed upon.—Eighty-four bodies had, up to March 22, been removed from the mine of the Sans Bois Coal Company at McCurtain, Okla., where an explosion of gas, followed by fire, occurred on March 20.

Secretary Knox's Tour

Secretary Knox arrived at La Guayra on the 22d and at once proceeded to Caracas, where the Venezuelan Government had prepared an elaborate program of entertainments. A holiday of three days had been ordered. Business was suspended. It is

said that never before had the Government paid so much attention to a distinguished visitor. There were parades, banquets, balls, illuminations and fireworks. The statue of Washington was appropriately decorated, and Mr. Knox placed wreaths on the statue of Bolivar.

—Letters received at New Orleans on the 20th from Nicaragua asserted that Mr. Knox narrowly escaped death in that country, and that forty men in prison would be tried for conspiring to kill him by wrecking the train which carried him to the capital from the seaport of Corinto. After the train had passed, it was said, a bridge was destroyed by a bomb, and thirteen infernal machines were found under the track at another place. Because the wire connection was defective, these had not been exploded. Acting Secretary Wilson, at Washington, says investigation has proved that the story is not true.

—In Nicaragua the Secretary was urged to hasten, if possible, a ratification of the pending loan treaty. He sent to the President a long telegram, in the course of which he spoke of the earnestness of the appeals addressed to him by the Government, which asked the United States to help it to maintain peace. The treaty, he said, was opposed only by a few anarchists and friends of the deposed Zelaya. He had been most cordially received. "Rumors of unpleasant incidents connected with my visit are false." Nicaragua's Congress has authorized the Government to borrow \$725,000 in addition to the preliminary loan of \$1,500,000 from the New York bankers who have consented to loan \$15,000,000 (under the treaty) for reforming the currency, paying the foreign debt and building a railroad. A new currency system has been planned by two American experts, and the customs revenue is now collected under the supervision of another American, Colonel Ham, formerly collector at Manila.

—President Manuel Bonilla, of Honduras, is suffering from an incurable disease, and has not long to live. His death, it is said, will be followed by another revolution.—A majority of the House committee at Washington having reported a Panama Canal bill providing for no discrimination in favor

of American ships, the minority, in which both parties are represented, has submitted a report urging that free passage be given to American ships in the coastwise trade, and saying that exaction of tolls from such ships would allow the transcontinental railroads to add an equal amount to their freight charges.

The Rebellion in Mexico

As Orozco's forces slowly moved southward, last week, several Federal garrisons surrendered, and a large majority of the soldiers joined his army. There were 150 at Baca, 300 at Parral, and sixty at Rosario. On the 23d General Sanchez, at Ojinaga (across the river from Presidio, Tex.), with 200 men, gave up without a fight, and Sanchez became a supporter of the rebellion. Madero had complained that our Government's new law prevented the shipment of arms to Ojinaga's garrison. Rojas, who, while in command at Juarez, robbed a bank of \$20,000, had been called to Chihuahua by Orozco. Upon his arrival he refused to go southward, whereupon Orozco put him under arrest and disarmed 200 of his men for mutiny. On the 22d the two armies were only 30 miles apart, north of Torreon. There was an inconclusive engagement of the vanguards. This was followed by a battle in which Madero's forces were worsted. Orozco captured two machine guns and thirty prisoners. The Federals, about 2,000, were moving northward in three railroad trains, preceded by an armored train devised by Diaz. Orozco placed forty boxes of dynamite on a locomotive and started it on a down grade. It struck the armored train and demolished it, killing sixty men. By a flank movement he had burned bridges behind the Federals, and 2,000 of them were partly surrounded. Among the wounded was their commander, General Salaz, recently Secretary of War.—Orozco has ordered the execution of Madero, if captured, and has warned Americans that contracts with Madero's Government will be void if the rebels win. The Chihuahua Legislature, under his control, authorized a bond issue of \$1,200,000. At first it was said that the bonds would be taken by the local Creel bank, but this has since

been denied by Enrique C. Creel. By threats of violence, subscriptions of \$200,000 were forced from merchants and others.—There were conflicting reports about the situation in the south. Zapata, driven from Morelos, went to the State of Puebla, where he captured several towns. Many Federal soldiers have joined the rebel forces. At the beginning of a special session of Congress there were many foes of Madero in the galleries. When a nephew of Diaz cast his vote for Speaker, the galleries cried "Long live Diaz!" and "Death to Madero!" There were several fights and the police were kept busy. But the Government's candidate was elected, by a vote of 106 to 74. De la Barra is on his way home from Paris, despite the cabled warning of several prominent Maderists. It is said Madero prefers that he should remain in Europe.

The British Coal Strike

The Government has attempted to settle the great coal strike thru parliamentary action, but its success is yet doubtful. A minimum wage bill was duly introduced and there is no difficulty about passing it, but it is questionable whether it would be accepted by either party. It was at first thought that the Unionists would make a determined fight against the bill because Bonar Law, but recently made leader of the Opposition, gave way for the occasion to his more distinguished predecessor, Mr. Balfour. The latter, however, made it clear at once that the Opposition did not intend to attempt to force a dissolution on this issue, and Mr. Law, when he was interrupted in his criticism of the bill by the question from the Liberal side, "What would you do?" answered frankly, "I am thankful the responsibility does not rest on me." The House was crowded on March 19 when Premier Asquith arose to speak for the bill, which was presented in blank because there was not time to complete the details. He explained that the bill was intended merely as a stopgap and would be effective for only three years unless the coal industry wishes to prolong it. The miners would be guaranteed a reasonable minimum wage and the owners would be protected from slackness. The

details of the amounts and methods would be left to district boards to determine according to local conditions. In case any district lacks a recognized board after a fortnight, some person may be appointed by the Board of Trade to act in that capacity. Miners who fail to comply with the terms laid down in the measure would lose their right to the minimum wage. Mr. Law replied that the measure might prove to be worse than the strike itself and would very likely fail to settle the question. George Cane denounced it as "a sop to a syndicalist conspiracy" and declared that he "would use all the resources of the state and clear the decks for war. It would be better to fight it out now." Lloyd-George said that he did not consider syndicalism a real peril. There was, he said, a difference between socialism and syndicalism; the former was accepted by some of the greatest intellects of Europe, while the latter had no such standing. Balfour's proposal to postpone the consideration of the bill six months was voted down by the usual ministerial majority, 225 in favor and 348 against. The implied support of the Opposition enabled the Premier to resist the demand of the Labor members that he incorporate in the measure the scale specified by the miners, that is, not less than 5 shillings daily for an adult and 2 shillings for a minor, working underground. The bill therefore passed its second reading without serious alteration. Instead, however, of rushing it thru its third reading and sending it on Saturday to the House of Lords, which was prepared to pass it promptly, the House of Commons adjourned for the week end, supposedly in order to give the miners and owners another opportunity to come to an agreement and so obviate the necessity of legislation. Both sides agreed to a conference on March 25. The officers of the Miners' Federation declare that the passage of the bill will not stop the strike unless it specifies their minimum wage scale of 5 shillings for adults and 2 for boys. They also criticise it for not including any penalty for violation. The mine owners, on the other hand, assert that they cannot fulfil their contracts if they have to pay such high wages, and that they will refuse to open their mines

Copyright, Underwood & Underwood, N. Y.

VIEW OF THE PONTYPRIDD COLLIERY DURING THE STRIKE

to be run at a loss.—The strain of the situation is being felt by all classes. No excursion trains are run to resorts and races. The railroads have laid off 60,000 men, who are dependent for support upon the union funds. Foundries, cotton mills and potteries are closed or running on part time. The miners' unions paid out last week a million dollars in strike benefits and other unions half as much more. The union funds are still further reduced by the fall in the price of the securities in which they are invested.—The Government has taken action against the *Syndicalist* magazine for publishing an article urging British soldiers to refuse to obey orders to fire upon strikers. The publishers, Ben Buck and Charles Buck, were sentenced to six months imprisonment for inciting to mutiny and the writer of the article, Guy Bowman, to nine months imprisonment. Tom Mann was arrested on the same charge at Salford, near Manchester, where he as well as Upton Sinclair addressed a syndicalist meeting.

British and German Naval Programs Winston Churchill, in presenting to the House of Commons, March 18, his first naval budget since his appointment as First Lord of the Admiralty, created a sensation throughout Europe by departing from traditional diplomatic language in referring to Germany by name instead of using transparent circumlocutions. He regretted the necessity of mentioning Germany specifically, but said:

"The Germans are a people of robust minds, whose strong masculine good sense and high courage do not recoil from and are not offended by plain, blunt statements of fact if they are exprest with courtesy and sincerity. Nothing is to be gained by using indirect modes of expression. It is better that both nations should understand without ill temper or disguise the conditions in which naval competition between them must be carried on within the next few years."

He said that it would not be necessary for Great Britain to maintain the "two to one" standard, altho it might possibly become so. "The two-power standard

has been extended by some of its supporters to include the United States, and by this means it has lost both good sense and reality." A 60 per cent. superiority in battleships and battle cruisers of the Dreadnought type as compared with the German navy would be a convenient basis for the next four or five years. On account of the decline in relative value of vessels of the pre-Dreadnought type due to the new ships of Germany, it would be necessary for Great Britain to construct four and three Dreadnoughts every year alternately for the next six years. "If we are now, as it seems, to be confronted with the addition of two new German ships in these six years, we propose to meet the addition upon the higher ratio of superiority by laying down four additional ships in the same period." Mr. Churchill added that any retardation or reduction of German construction would be promptly followed by a proportionate measure of reduction in Great Britain. He illustrated this point by supposing that both countries took a holiday in the year 1913. If Germany did not build her proposed three ships she would not only save \$30,000,000 or \$35,000,000, but her action would automatically wipe out no fewer than five British super-Dreadnoughts, which would be more than Germany could hope to do in actual warfare.

"This is our position—that the Germans will not be gainers in naval power by any increases they may make and will not be losers from the basis I have laid down by any diminutions. Here is a perfectly plain plan and arrangement by which, without diplomatic negotiations, without bargaining, without the slightest restriction of the sovereign freedom of either Power this keen and costly naval rivalry can at any time be abated."

Mr. Churchill asked for appropriations for next year amounting to \$220,427,000, a decrease of \$1,535,000 from the amount of last year. His program involves the building of twenty-one Dreadnoughts in the next six years. He also announced the intention to construct a large number of submarines, destroyers, and a new type of small, swift, light-armored cruisers for coast defense. This force will be under the

command of an "Admiral of Patrols." He expected that before many months every squadron would have its regular flock of naval aeroplanes. He also anticipated the increased use of oil as fuel, perhaps in the form of internal combustion engines, thus multiplying the efficiency of a warship three or four fold. The speech of the First Lord of the Admiralty was greeted with applause from papers of all parties. The *London Times*, which was sharply critical of Mr. Churchill when he was in the Home Office, calls it "the best exposition of a naval policy which has been made since Lord George Hamilton's famous statement of 1889. It is not only vigorous and clear, but the policy it discloses is firm, intelligent and statesmanlike." In Germany, on the other hand, it aroused universal indignation and wild rumors of impending war. The announcement that the Kaiser had postponed his departure for Corfu on account of "difficulties in the sphere of internal politics" increased the apprehension, for the coal strikes in Germany had mostly collapsed. It was commonly believed that the Chancellor, Dr. von Bethmann-Hollweg, and his Foreign Secretary, Herr von Kiderlen-Waechter, were about to resign and that Admiral von Tirpitz, Secretary of the Navy, was to assume the chancellorship, with a big navy as his policy. But the Kaiser left for his Corfu palace on time, after all, and the only change in the Cabinet was the retirement of Secretary of the Treasury Wermuth, who represented Germany at the Chicago Exposition in 1893. Whether in accordance with the hint of Mr. Churchill or on account of the opposition of the Socialists to increase of armament, the naval plan, when presented to the Reichstag on March 22, called for only two Dreadnoughts a year for the next five years, instead of the three that had been contemplated. The bill, however, calls for an extra battle squadron, for which three additional battleships and two cruisers are to be constructed before 1920. The military program calls for an expenditure of \$84,500,000 during the next three years for increasing the army.

Ermanno Wolf-Ferrari

BY CHARLES HENRY MELTZER

[Mr. Meltzer is one of New York's best known critics and playwrights and has already contributed many articles on musical topics to THE INDEPENDENT.—EDITOR.]

WHILE some were dreading that pure melody was dead, a new composer—young and full of life—has convinced them they were wrong.

In Ermanno Wolf-Ferrari lies the proof. A year ago he was known to most Americans only as the inventor of an exquisite cantata, "*La Vita Nuova*," which had been sung with great success here once or twice. The production of a charming "intermezzo," as he called it, under the title of "*Il Segreto di Susanna*," by the Chicago-Philadelphia Grand Opera Company, threw a new light on his art. It showed him as a composer of pure opera-buffa, dainty and rare, and sparkling and melodic. "*Il Segreto*" was an epigram in music, worthy of a Rossini or a Mozart.

This season the composer of "*Il Segreto*" and "*La Vita Nuova*" has been very prominent in America. Besides the two works I have named, he has given us two more operas. He has been praised and lionized. A year from now, maybe, he will have replaced Puccini in our affections. And he has not yet done his best or highest work.

Ermanno Wolf-Ferrari, whom I have met and talked with often, here and abroad, was born in Venice six-and-thirty years ago. He is the son of a Venetian Catholic mother (a woman of the people) and of a German father. But, tho still little known and sung in his own land, he is at heart and of his nature all Italian. His father, who is living, has reputation and some merit as a painter. It was his hope that young Ermanno would devote himself to his own art. He sent his son to Munich to learn painting. But from early childhood Ermanno had longed to be a com-

poser. A pianist (not a man of much importance) had taught him the rudiments of music. In Munich Rheinberger, a more famous man, grounded him in counterpoint. Before he was twenty he had composed music for the concert room and planned out an opera.

At the outset of his career he became enamored of Bach. But little that he did contented him—among the more pleasing of his qualities is modesty. Nor did the production of "*Cinderella*" at the old Fenice Theater in Venice do much to encourage him. The work was soundly hissed. Despairing of success in his own country, Wolf-Ferrari went to Germany, where, at Bremen and at Breslau, "*Cinderella*" was received with much applause.

He settled down in Munich. There he composed and saw the first triumph of his "*Vita Nuova*," a very lovely setting of the tale of Dante's love for Beatrice. To many this still seems the finest effort of his youthful genius. It was succeeded by at least four operas, among them "*Le Donne Curiose*," which enchanted us this season (Wolf-Ferrari was twenty-eight when he created it), and "*I Gioielli della Madonna*," as to which our critics seem to be at variance.

Meanwhile, for five long years, without much joy, the composer had acted as director of the Venice Conservatory. He found, like many others, that teaching music was not helpful to invention. So, for the second time, he bade farewell to Italy and gave himself up heart and soul to creative art. Meanwhile, too, he had married an American singer whom he had met in Germany—a woman of a strange, old-fashioned kind, who, for her husband's sake, renounced ambition and became a simple housewife.

While working, Wolf-Ferrari lived plainly—even poorly. Not that that vexed him much. He does not care for show or vain rewards. All he asks is to be rich enough to have peace of mind, without which, to a man like him, art is at best a tortured ecstasy.

When I first had the privilege of meeting him, Wolf-Ferrari was boarding with his family in one of the most modest Munich hotels, respected by his friends (for Munich is quite free from snobbishness), but little known to the great outer world. His personal charm, his unpretending ways, the unusual buoyancy of his temperament, the philosophy of his attitude toward men and life, at once won my sympathy. He spoke without pride of what he had achieved and without bitterness of his competitors. And he was frank withal, making no secret of his aloofness from the artistic tendencies of Richard Strauss, admitting that he did not much admire the style of Claude Debussy, and adding that, for his part, he believed good music, even in these latter days,

might be composed without enormous orchestras. But nothing that he said upon this point committed him to the simplicity of Mozart. He told me that he wrote the music which seemed fitting to his subjects. The employment of loud brass in dealing with the light comedy and light characters of Goldoni would have offended his fine taste. Yet when, in his most recent opera, he was handling passion, lust and crime, it seemed right and proper to him to employ a full modern orchestra. What could be saner?

Wolf-Ferrari is somewhat broadly and heavily built; smooth shaven and with a touch of the clerical in his appearance. But for his thick black hair, which he wears parted in the middle, and unbroken by the tonsure, he might be taken for a Catholic monsignore. There is also just a touch at least of the Semitic in his look; tho, as he assures me, he is not of Jewish origin. His grandfather, indeed, was a Protestant minister. The most pleasing features of the composer's face are his kind, frank, observant eyes, his broad forehead and his large, humorous mouth.

That mouth of his explains much that delighted us in "Il Segreto di Susanna" and "Le Donne Curiose." The humor (and the wit) which marked the music, no less than the dialog, in both those works, set Wolf-Ferrari in a class apart. Humorists are rare in music. Haydn played jokes in certain of his symphonies, and Strauss was gay and prankish in "Till Eulenspiegel." But as a rule musicians of high rank are rather serious. The orchestration of "Le Donne Curiose" and "Il Segreto" provoked smiles and laughter. It expressed many quips and quirks which amused one in the libretto. With other qualities, Wolf-Ferrari has an amazing and inestimable sympathy with comedy and drama. In his early operas he was drawn to comedy. But in his latest work, "I Gioielli della Madonna," he made it clear that he was quite in touch with tragedy. Of him it may be said some day, as it was said of a great poet (and of the "Sapho" of Alphonse Daudet), he had "toute la lyre." Whether he will ever stand in the front rank of the composers of his land, with Verdi and Rossini, it

ERMANNOWOLF-FERRARI

AMADIO BASSI IN "THE JEWELS"

This three-act opera had its first production last December, in Berlin, and was given its American première by the Chicago Grand Opera Company, January 14, 1912. The libretto, by Zangarini and Golisciani, tells a terrible and passionate story of Neapolitan life, with the Cammorists playing a baleful part in it. The first scene shows the workshop of the blacksmith, Gennaro, interpreted by Amadio Bassi.

is still too soon to tell. At present I believe he is in a transitional stage. He has not yet wholly "found himself." The exquisite delicacies of "La Vita Nuova," in which he came near to making heavenly light seem audible, were not always quite original, tho they were always individual. Hints at Verdi, Puccini, Rossini, Mozart and Saint-Saëns are noticeable in his operas. Yet very seldom, if ever, could Wolf-Ferrari be taxed with plagiarism. The most original of his achievements seems to me thus far his "Vita Nuova"; the least original, "I Giojelli della Madonna." All that he does, or nearly all, enchants one by its taste, its fitness, its discretion. But, in "I Giojelli," the composer was unquestionably haunted by "Carmen,"

and had, let us say subconsciously, followed in the steps of Bizet, Mascagni, Verdi, Ponchielli and Saint-Saëns.

When I last saw Wolf-Ferrari, on the eve of his departure from New York, he was dreaming of a new opera and meditating the invention of a score to serve as a setting for a small thing of my own, a short "dramatic symphony, with dances, choruses and soli." Wolf-Ferrari has an instinctive love of dancing, which he looks on as a great art in its infancy.

"Years before Isadora Duncan and her imitators thought out those classic dances which are now so popular," said the composer to me lately, "I had conceived them all in dreams."

He added that some day a great musician would be born—another Wagner—who would also be a dancer, and interpret marvelous dance music.

Wolf-Ferrari thinks that dancing has till now been only tentative; a groping, as it were, toward a higher and more noble form of expression. The dancers of the day (the "classic" dancers) have, he believes, been handicapped. They have had either to resort to trivial music, or to use music (like the symphonies of Beethoven and the creations of Chopin) which was not written for their purposes. In several works he has already shown his fondness for the higher kinds of dancing. Did he not in his lovely "Vita Nuova" write that wonderful "Dance of the Angels"? The final minuet in "Le Donne Curiose" and the maddening "Tarentella" in "I Giojelli" are still ringing in our ears. These helped (and very largely) to assure the popularity of the three works in question. The gracious measures of the "Angels," above all, were full of beauty. In nothing that the composer has yet done has he seemed more inspired.

The modesty of this new light in music does not exclude audacity. It was a bold thing, in this day of Strauss and Debussy, for a composer to revert, as Wolf-Ferrari did in his earlier operas, to the simplicities of Mozart. It was a bolder thing, maybe, after he had won our admiration by the success with which he had continued Mozart's style, to venture on the realism of "I Giojelli."

NEW YORK CITY.

Mr. Roosevelt and the Third Term

BY HARRY PRATT JUDSON, LL.D.

PRESIDENT OF THE UNIVERSITY OF CHICAGO.

THE Presidential canvass of 1912 is now rapidly passing thru its first phase and soon will reach the second. The determination of the specific candidate for each of the great national parties will be attained by the end of June, and thereafter the contest before the country will be between these two. There seems at present little likelihood that there will be other candidacies of any moment before the electorate in November.

The question in the Republican party is apparently narrowing down to a choice between the President and the ex-President, and the lines on which the choice will be made are now quite clear.

The renomination of the President, it seems to me, ought to be made, for some quite cogent reasons.

It is a question whether any preceding President has been so painstaking and so wise in selecting Federal judges as the present chief magistrate. He has made his choice solely on the ground of character, legal learning, and judicial temperament. This alone is a great service to the nation, and one whose benefits we shall long enjoy.

For the first time in our history a rational plan for the enactment of a protective tariff statute has received the weight of the executive approval, and has been tested in practice. Of course if the tariff tax is laid solely for revenue it does not matter what may be the facts as to cost of production at home and abroad. But so long as the protective principle is followed it is far better to pass on one schedule at a time with full public knowledge of the facts on which action is taken, than to continue the old method of log-rolling with no accurate information.

A wise achievement of the Administration was the reciprocity arrangement with Canada. Had our neighbors on the north considered this measure on its separate merits it seems not unlikely that it would have gone into effect. However that may be, there was in the plan a large

vision of international policy going quite beyond the immediate economic effects to be anticipated.

The peace treaties with Great Britain and France were a long step in the direction of lessening the likelihood of wars. That they might have had some slight amendment in the interest of defining their scope and their method may easily be. That they should have been so drastically modified as to make them probably futile was a proceeding which can hardly be defended unless on the ground of petty politics. One remembers the factious opposition to President John Quincy Adams on the matter of the Panama Congress. The attempt to defeat the plan failed in the Senate, whereupon one of the opposition is said to have remarked that it was a pity the President had not opposed the Congress, as then his (the Senator's) friends would have voted for it and so the President would have been defeated overwhelmingly.

On the above grounds, and setting aside any personal disappointments and antagonisms, it would seem clear that the President is entitled to a renomination at the hands of his party.

On the other side we are offered two inducements, the destruction of the independence of the judiciary and the third term.

Whether the courts are to be made subservient by the recall of the judges, or by having a lawsuit settled by a popular election, is practically immaterial. Either goes a long way toward undermining the guaranties of the rights of the individual and of minorities heretofore so sacred in all our constitutions. The American people will surely hesitate before sacrificing one of the chief bulwarks of civil liberty.

But the central question at issue is the third term, defended on the ground that it is not a third consecutive term. This is a departure from the unbroken traditions of the republic so startling that surely it should be examined with care before adopting it.

The President of the United States has more power than any constitutional monarch. That he does not speedily grow to be a monarch is due to the limitation on his term of office to four years. The people are then free to re-elect him for a second term of four years, and then successively thereafter thruout his life. This is about what was done in Mexico in the case of President Diaz, his incumbency being finally terminated only by revolution. With prevision of such possibilities it was early settled by practice that the people would re-elect for one term only, thus limiting the Presidency of a single man to a period of eight years. This was what the late President so aptly designated, in his statement of 1904, as "the wise custom which limits the President to two terms."

Now we are told that so long as the third term is not consecutive with the second there can be no objection, inasmuch as the candidate for a third term is thus deprived of the great power of the Presidency in seeking a renomination. In so far as the candidate is without this great power—and if the policy of seeking a third term once becomes established, as is certain to be the case if the existing custom is once broken down, there can be no assurance that arrangements may not be made by which a President may use his power in favor of a third term for his immediate predecessor—still, in so far as a candidate in fact lacks the power in question, the objection to a third term is to that extent lessened. But objection remains very serious nevertheless; so serious that the mere question of consecutiveness becomes a trifle.

In the first place there can be no doubt that as soon as the custom of two terms only is broken down every President will expect and will seek a third term. This is what happened as to a second term. Every one-term President, perhaps with the exception of President Hayes, has desired a second term, and has been greatly disappointed in failing to get it. Exactly the same will be the case as to a third term. We may expect then at once a new series of political combinations looking to that end, with a possible alternation of the succession so that there will be only two different Presidents in a twenty-four year period. This is no mere

fanciful conjecture. • Knowing human nature and politics as we do, and being guided by the light of the past, we can expect nothing else.

But this is not all. When once the two-term-only tradition has disappeared we may next expect that the intervening of an intercalary term will soon be flouted as a mere superstition, and will not long endure. A President uses his power to secure a second consecutive term; why not to secure a third consecutive term? If a third term at all, why not a third consecutive term? The third term principle once settled, we may be very sure that the "consecutive" limitation will vanish into thin air in company with the two-term-only limitation.

But why stop with a third term? The same reasons will apply for a fourth term, or for any number of terms. Indeed, the continuous Presidency already has its advocates. *The Outlook*, of the 17th of February, 1912, quoted approvingly its former editorial of April 16, 1879, in which it was said: "There is no objection to three terms, or thirty terms, if the man is a good one." . . . "Indeed, a good Presidency that should last twenty years would be a great boon to the country." Here we have the doctrine of the continuous Presidency frankly proclaimed. Obviously the "good" President would be one who could contrive to secure continuous re-elections. He would be "good" in the eyes of his adherents—and we have already built up a governmental bureaucracy which is able to intimidate members of Congress, and which with the extension which new legislation may easily bring will be a powerful support of the continuous Presidency. It may be that the best government is that of a benevolent despot. But experience has shown that after all it is safer to get along with less efficient government than to risk a despotism.

Of course the only real justification of the continuous Presidency is that there is only one man in the republic who is capable of administering the government wisely. This was just what was so often asserted with reference to President Diaz. Perhaps that judgment was correct as to Mexico. Are we prepared to believe that such a judgment is correct as to the United States? Are we pre-

pared to enter on a path which leads directly towards the Mexicanization of our country?

But, we are told, if the people want a continuous Presidency why should they not have one? At any quadrennial election he can be defeated. Possibly. Has it been so easy to unseat a political camarilla in all the States? Has it been so easy to choose reliable legislatures and efficient city governments? *Facilis descensus Averno*. The easiest way to pre-

vent an undesirable continuous Presidency is to stop where we are and to maintain the "wise custom which limits the President to two terms."

I am convinced that the American people will think long before they cast aside one of the wisest traditions of the republic. Perhaps the New York election of 1910 may throw some light on the way in which this grave possibility will be regarded.

CHICAGO, ILL.

The Narrow Skirt

BY CHARLES PHELPS CUSHING

THE prolonged popularity of the glove-fitting skirt apparently is due to the fact that this mode classifies as an aid to beauty. It enables many women to appear beautiful without the assistance of a face, and others, who have faces, to appear doubly entrancing. As a costume for standing on the corner and waiting for a car it is unexcelled. Any attempt at motion, however, quickly reveals the hobble's weakness. For walking it is impractical, and for climbing stairs impracticable. That is, for any but contortionists. It is easily conceivable that many a home has gone to wreck because the impossibility of climbing stairs in a modish hobble has rendered all of the house tenantless except the first floor.

In a more serious and literal sense, the glove-fitting skirt has been arraigned recently as a wrecker of homes in America and on the Continent.

"Lay the blame on every woman who wears a narrow skirt."

A quarter of a million jobless men and women in American textile trades have heard this message from manufacturers. In France, affairs are reported to be much worse than in America; business in French loom towns is in a panic, and hundreds of families are having a taste of famine. The government has tried to force Paris into wearing fuller skirts, to set a good example, but the golden days of Louis XIV, when a mandate could control the fashions, appears

to be too long past to be successfully recalled. For spring and summer there is no word of anything but hobble and sheath; while only a suspicion of a rumor exists that there will be any saner mode in the autumn.

Manufacturers make the argument that narrow skirts require $1\frac{1}{2}$ to 4 yards less goods than former styles; in consequence, twenty-five per cent. of the looms must be stopped and a like proportion of operatives left idle. In the train of this, 100 out of 175 of the American mills that in 1910 were weaving petticoat fabrics have been closed in the last two years, because with form-fitting skirts the fashion of wearing petticoats has gone into rapid decline. For a last count, the manufacturers declare that because the narrow skirts require extraordinary suppleness and strength of material, a more costly variety of textile has come into demand, and thus the wearers of glove-fitting skirts have contributed another item to the increased cost of living. Of course, if women made their own clothes, they might be saving money on the skimpiness of the present style. Ditto for men if *they* made their own clothes—shoulders are being cut so much narrower these days, and rah rah trousers having gone out! Statistics show, however, that most people nowadays prefer to buy their clothes ready-made or from tailors.

NEW YORK CITY

One of the Immortals

BY CLIFTON C. PUTNEY

ONE Sunday, when I went up to see Minnie, as usual, she met me at the door, acting just as if there was a funeral going on in the house, and she kissed me as if her mind wasn't exactly on what she was doing. I guessed what was up before she told me.

"Uncle Jasper is here," she says.

"So?" I says. "Let's see the old cuss."

She giggled, subdued like, but she got sober right away, and took me into the parlor, where he was sitting up in his chair holding a tin trumpet up to his ear. It was the first time I ever saw him, tho, of course, I had heard enough about him, like everybody else. He was a little, dried up man, with a big hook nose and a pair of boiled eyes.

"Howdy, Uncle Jasp," I yells into the tin trumpet and gave him a grip I intended he should notice. But he didn't. He was just as tough as he looked.

He scowled at me. "So you are going to marry Minnie?" he says, after he found he couldn't stare me out of countenance.

I allowed that he had made a good guess.

"Minnie's a good girl," he says.

"Best that ever chewed gum," I yells back at him.

He scowled worse than ever. Then, "Does Minnie chew gum?" he squealed.

"I never caught her at it," I says.

"Then what did you say that for?" he shouts, mad as fury.

"Got to say something," I says, keeping up a cheerful smiling all the while.

"Humph!" he says, and he didn't say anything more for quite a while. But finally he shot out another question.

"Where do you work?" he says.

"Over to the saw works. Toolmaking."

"Ho!" he says. "Toolmakers get pretty good pay."

"I don't," I told him, and he scowled further.

"Got any money saved up?" he asked.

"Not a cent," I says, cheerfully. It

was cheerful lying, too; but I knew that he wouldn't call what I had anything.

"You must begin and save," he squeals. "That's the way I done."

"Look here, Uncle Jasp," I says; "I wasn't thinking of marrying you. Just Minnie."

He scowled pretty black over that for awhile, but finally he put on a kind of a crooked grin.

"You're a pretty smart young feller," he says, and then he took down his tin trumpet, which was a way he had when he didn't care to pursue the subject. I concluded that I hadn't made much of a hit with him.

I saw quite a little of him after that. He was in the habit of coming over from the county seat where he lived every month or so, and snarling around and bullying those two women just as if he was at home. It made me a little hot until I found out that both of them enjoyed it first rate. Minnie's mother was that kind of a woman. I guess Minnie must have just followed her mother's lead, because she hasn't shown any symptoms of that kind since she was married. Not so you would notice it.

After that I wasn't so much surprised when I found out that both of them thought a good deal of the old rascal; and it wasn't all his money, either, altho they talked a lot about that, too. Minnie's mother would say: "It does seem as if he ought to leave us a little something. We are the only ones he ever goes to see, and he seems to like to come. I don't care for my own sake, but I would like to see Minnie get something, if it's only a little."

"He'll never die," I used to tell her. "He's too mean. That kind don't die until it won't do anybody any good." I didn't sympathize much with her ambitions for Minnie, tho, since the children began to come, I have seen things a little different.

We got married right away, that spring, and Minnie took charge of my

pay envelope right from the start. That was the first real boost I ever had. How a girl who had worked in the suspender factory every day since she was fifteen knew enough to stretch my little twelve dollars a week over so much ground is something that surprises me yet. My second boost came about in this way.

Along toward the end of the second year after I was married I got hold of the fact that there were going to be big doings over at the Point. It don't make any difference how I got wind of it; I didn't get the whole thing at once, anyway; but I mulled over it for a week, then I took all the money I had and went over and got options on as much of the Point as I could. You know the Point is about as poor land as ever lay outdoors, all sand and rock; so I secured a good deal of it.

It wasn't long before the big fellows behind the improvements heard what I had been doing; but after they had looked me up and found out I wasn't worth anything, they decided not to bother with me. They just made trades with the owners of the land and sat down to wait for my options to expire. Which would have done very well, if other people hadn't come to hear about it, too. Before my options were within a month of running out I had offers which were good for ten times what I needed. I had about decided to hitch up with Ethan Rumrill, as square a man as ever stepped, besides having been by way of being a friend of my father's; but Minnie said I ought to give Uncle Jasper the first chance. And seeing that she had fought, tooth and nail, against my ever going into the business and was only half reconciled then, I decided to do as she said; notwithstanding the fact that I had never made any hit with Uncle Jasper, any more than I had at first. I told Ethan what I intended to do and his eyes opened like saucers.

"Old Jasper!" he says. "Lord, boy, he'll skin your eye teeth."

I allowed that was a chance I'd have to take.

"Well," he says, "if he won't go in, or if you have any trouble with him, come to me"; and I said I would. "Wife's uncle, hey?" he goes on. "She ought to get some money, same time."

"No, she won't," I says. "He's too mean to die."

Which Ethan allowed might be so.

And I certainly had a pleasant interview with Uncle Jasper. I hadn't more than started yelling my business into the tin trumpet when he turned around on me with the pleasantest expression I had ever seen on his face.

"You're a pretty smart feller," he squeals; then he laughed outright. "Ho, ho, ho," the first time I ever heard him. "I knew you'd sing small some day, just like all the rest of 'em. Young man," he goes on, shaking his finger at me, "young man, I've had just fifteen chances to set every one of my relations up in business; and I hain't accepted one of 'em. Not one of 'em. D'ye understand? And I ain't goin' to accept this one, either. D'ye understand that? Do you, hey?"

He was having such a good time over it that I had to laugh myself.

"Hold on, Uncle Jasp," I says. "Don't get excited. I told Minnie I didn't think you'd come in, but she thought I ought to give you the first chance. I guess me and Rumrill can get along all right."

His eyes opened a bit at that.

"Rumrill? Ethan Rumrill?" he squeals.

"Sure," I nodded. "He told me to come to him if you didn't care to invest."

"You are a lyin' to me," he yelled.

"All right," I grinned. "Have it that way if you want to. We'll talk about something else."

But that wouldn't do at all, and for two solid hours I explained and described until I judged I'd earned all he would ever put into it.

"Well," he says, finally, "have your options made over to me and I'll attend to the business and when it's all settled up I'll do what's right by you."

I got up and reached for my hat.

"Goodbye, Uncle Jasp," I says. "Come over and see us when you feel like it."

But he was on his feet as soon as I was, catching hold of my arm, and explaining and fussing until I sat down again. Then I told him short and sharp just what I would do and what I wouldn't do. And I pulled out my watch and gave him five minutes to take

it. Which he did, after more squirming than I thought could possibly be put into that space of time.

And we made money, a good deal of it as we were bound to. Which you might think would have made Uncle Jasper a little sweeter on me. But it worked just the other way. You see, I had fixed it so that I had the whip hand all the time, and I don't think he ever hated me the way he did when I insisted on doing somewhere near what was right by the fellows whose land we were dealing with.

And that is the story of a number of other deals that I got interested in with Uncle Jasper. When we helped young Simonds with that little machine he invented, the old rascal argued for two days, trying to get me to agree to sell the boy out and leave him high and dry. And he could find chances for that sort of thing that nobody else would dream of. The time we hooked up with Jimmie Hogan for a little while I sort of laid myself out to fix it so Uncle Jasp wouldn't have a chance. But the hole was there, big as a barn door after he'd pointed it out; big enough so we could have got the saw mill and Jimmie's share in fifteen million feet of lumber, besides. I laughed so when I finally saw how it was that Uncle Jasper just looked ugly and didn't say another word.

It was with the kitchen stove that I finally made my hit with him. Of course, he was too shrewd and careful to buy one from a dealer in his own town that he knew was half honest and had a reputation to keep up. He felt safer trading with a traveling agent who sold him as nice-looking a stove as I ever saw, with a printed guarantee which was as strong as language could make it, underlined in red and with gilt filigree all around the edge. It was as pretty to look at as the stove itself, and I guess that's why Uncle Jasper put so much faith in it.

But when the widow woman who had kept house for him for forty years, more or less, tried to run that stove, she found out that she couldn't bake anything except with a brand-new fire. Things just dried up, she said. Which was no great matter in warm weather, but when it got to be winter, and folks wanted to keep fires all the time, it began to be annoy-

ing to the widow woman and more to Uncle Jasper. He had a notion that it takes more coal and consequently costs more where you are building new fires right along. Which may be so and may be not so; but you can probably guess that Uncle Jasper took his knowledge pretty hard.

Well, he wrote the stove people a letter, and more letters after that; and he got answers, nice, polite ones. But pretty soon he came to the conclusion that that was all he was likely to get, and he certainly made a noise. You would have thought he stood to lose his last dollar. Minnie's mother allowed that *she* could run that stove and I could see that Minnie had a pretty good notion that *she* could, too. Neither of them thought very highly of the widow woman, anyway. But they both had to give up beaten, after trying it. I drove Minnie over and Uncle Jasp was so regularly crazy about the business that I wasn't surprised any when he came over, a few days after, and wanted me to take him to a lawyer.

"An honest one, if you can find him," he snarled.

He never stuck to one lawyer for any length of time, for reasons which I didn't know, but didn't have any trouble in guessing. I heard that he had had rows with all of them over to the county seat. So I took him to Brownlee, a young fellow that I had got advice from at one time and another; one of these easy-going, moderate sort of fellows that will never get rich. But he knew what the law was and would tell you if you kept at him sharp enough.

I don't see as there's much you can do," he told Uncle Jasper, after he had heard the whole story.

The old fellow went completely off the handle then.

"Why not?" he squeals; "why not? Didn't I buy that stove of 'em, and ain't I got a guarantee?" And so on and so on for about half an hour, while Brownlee sat and grinned and I tried not to, for Minnie's sake.

"Who signed your guarantee?" Brownlee asks as soon as he had a chance.

"Why, that Backlog Furnace Company. Can't you read?" squeals Uncle.

But Brownlee shook his head. "That's not a signature," he says. "That's printed, or, rather, engraved, like all the rest of it. Oh, we could prove it on them, undoubtedly. But did you ever stop to think how much it would cost?" Then he went on and explained how Uncle Jasper would probably have to sue in another State, where the stove factory was, and how he'd have to summon witnesses and pay carfare and hotel bills, to say nothing of his lawyers. Altogether, Brownlee thought it would cost about six times what he would get out of it and maybe more.

Uncle Jasper got worse than ever.

"You're all alike," he yells, shaking his fist. "Ye're all in together. Ther' ain't an honest lawyer in the country. How much is the stove company payin' ye?" And so on, while Brownlee sat and grinned, nice as a basket of chips.

All the while a sort of an idea had been working in my head and while Uncle Jasper was talking I picked up a pencil and wrote a line or two on a piece of paper and handed it over to Brownlee. He read it, grinned harder than ever, and passed it over to Uncle Jasper.

"That may work," he told me. "They are doing a lot of business in this county just now."

Uncle Jasper scowled at the paper, black as thunder, but in a second or two he began to grin, and finally he laughed for the second and last time in my experience of him. At last he turned round to me.

"Nephew, you're a smart man," he says, still chuckling; and from that day on he never called me anything but "nephew," which he had never done before. He was so tickled that he offered Brownlee a dollar without being asked. But Brownlee wouldn't take it, for all that I kept telling him, down low, not to let that kind of a chance get by him.

Two nights afterward when I picked up our local paper I found the ad. just as I had written it:

"For sale; a Backlog kitchen range, almost new. Will not bake except with a brand-new fire and no reasonable offer will be refused. A good chance for any one who can use that kind of a stove. I can't. Apply to Jasper Whicher," etc., etc.

Within three days I found the same thing in most all the papers that circulated in the county. About the same time I got a hurry-up message from Uncle Jasper for me to come over to the county seat. He had telephoned Minnie while I was away and had reversed the toll.

I went, of course, and he met me at the door, cheerful and friendly.

"Nephew," he says, "the man from the stove company is coming, and I thought perhaps I better have a witness. He came this morning, but I wouldn't see him."

He had no more than said it when the stove man came, a nice-looking, slick dressed young fellow, and Uncle Jasp met him just as friendly as he did me.

"Sorry I wasn't here this morning," he says, grinning away. "I suppose ye've come to settle about that stove. But I guess ye're a little late. I've advertised it for sale and I guess I can work it off on somebody."

"I didn't come to settle," the young fellow answered, right off peart. "I come to see about that ad."

"Ho! You want to buy?" says Uncle Jasp. "What'll ye give?"

"No, I don't want to buy," the stove man said, sarcastic like. "I came to tell you that that ad. is libelous and you've got to take it out."

"Pho! Libelous?" Uncle Jasper's eyes opened as if he was surprised. "It ain't libelous, either. I've got a right to sell my own property."

"But you describe it in a libelous way," the young fellow answers. "We've got several agents in this county."

"Nothing but the truth." And they thrashed it out for a long time, Uncle Jasper just as smiling and innocent all the while, and the stove man finding out little by little that he had a hard time ahead of him.

He got up finally. "I'll sue you before dark," he says.

"Well," says Uncle Jasp, "I've made a good deal of business for lawyers in my life, and it's always been the other feller's fault, and I guess a little more won't make much difference. Nephew," he says, turning to me, "nephew, can't you give the young man a cigar? It ain't his fault he works for such people."

So I pulled out my case and Uncle Jasp took one, too, and the young fellow sat down again, all of us smoking. After a little more talk he wanted to see the stove. So we went out into the kitchen and the widow woman told him about all the trouble she'd had, and I spoke up about Minnie and her mother's trying it. Finally he offered to replace it with a new stove. But Uncle Jasp shook his head very decidedly.

"Don't want any more of 'em," he says. "This one has given me all the trouble I want." And they went at it again. I could see that the young fellow was getting pretty tired of the whole business, to say nothing of his voice being all frazzled out with hollering into the tin trumpet. Finally he asks Uncle Jasper what he will do, anyway.

"Well," says the old cuss, considering like, "I'd about giv' up the notion of settlin'; but if you'll pay me for the stove and giv' me, say, a hundred dollars for my trouble, I'll call it square."

The stove man nearly jumped out of his chair.

"I should say you had given up the notion of settling," he yells. But, knowing Uncle Jasp, I could see that the fun was most over. They dickered for half an hour more, but the result was never doubtful. Uncle Jasp got a check for what he was out of pocket and the promise of a new stove; and he gave the stove man authority to stop the ads. and a signed paper stating that the matter had been settled to his entire satisfaction. It didn't surprise me any when Uncle Jasp included in his bill the dollar that Brownlee wouldn't take and the telephoning that he had had charged to me; but I did notice that he didn't say anything about the cigars I had passed around that afternoon.

He came back, rubbing his hands, from seeing the stove man out; but he didn't say anything and I didn't either. Pretty quick he dug up a couple of cigars from somewhere and offered me one, which looked to me as if he was breaking up. But I decided to smoke my own.

"Nephew," he says, after we had smoked a little while; "Nephew, I'm gettin' to be an old man. Sometimes I think I won't last much longer."

"Forget it," I says. "You ain't the dyin' kind."

He grinned back at me real pleasant, not exactly catching my drift.

"Yes, I'm tough," he squeals; "but I've got to go some time." He didn't say anything more for a minute; then he started again. "I've got to go some time, and I don't know what to do with my property. I've got together a good deal of it, nephew."

He looked up at me so innocent and so surprised that he had done so well that I laughed outright.

"Take it with you," I told him. "I don't go so much as some on this melting business."

For just a minute he didn't look just pleased, but it wasn't long before he was grinning away, friendly as ever. I wouldn't be certain that he didn't cackle over it once or twice. But he didn't say anything more about his money then, or afterwards either. Perhaps that's one reason why we always got along so well together after that.

And I guess that is what he means to do, take it with him. Oh, yes; he's still living, over to the county seat, with the widow woman keeping house for him, and he's getting tougher and richer and meaner every day. As I say, he ain't the dyin' kind.

WESTBORO, MASS.

Campaign Fund Publicity

BY PERRY BELMONT

PRESIDENT OF THE NATIONAL CAMPAIGN FUND PUBLICITY ORGANIZATION.

AFTER more than six years of effort, an effective law was enacted, August 14, 1911, requiring the publicity of campaign funds—contributions and expenditures. That enactment marked the most progressive step taken in the United States, or in any country, toward the abolition of secret party funds used to influence elections or to promote interests affected by, or dependent upon, political power.

At the moment public opinion in the United States, thus reflected in the action of Congress, had reached that degree of development, in which the Publicity Law Association had been an important factor, the writer received two letters, one from a great English political leader, the other from an American Senator, which illustrated, in a remarkable manner, the progress made in our country as compared with existing conditions in England.

Our Publicity Law of 1911 was enacted during the political crisis in England, when the exigencies of party politics threatened the creation of a large number of new peers. Upon receiving a copy of our Campaign Publicity Law of 1910, which had been sent to him at his request, the English statesman referred to wrote as follows:

"I think it quite possible that some such movement as that which has produced legislation on your side of the Atlantic may make itself felt here. At the moment, however, I should conjecture that public opinion was hardly ripe for it."

The Senator's letter was as follows:

"Some of the Republican Senators, who are really opposed to the publication of campaign contributions, voted for the primary amendment in the hope that it would defeat all legislation on the subject, and other Republican Senators voted for it because they wanted to make the bill as obnoxious as possible to Southern Democrats, and thought that the best way to do it. The Democrats who voted for the amendment were controlled by the fear that the people would think they are not as radical, on the subject of the publicity of contributions, as their Republican adversaries.

I assume that the House will disagree to the Senate amendment and ask for a conference, but I am rather inclined to believe that the House will be compelled to accept this amendment or else allow the bill to fail."

One letter contained the information that public opinion in England would not justify any attempt to secure legislation from Parliament on the lines of our Publicity Law of 1910. The other announced the passage thru the Senate of a much more progressive bill, which became law at the extra session of the present Congress.

Large secret party funds continue to be tolerated by public opinion in England, and are at the command of the leaders of the two great political parties. It is generally conceded that peerages, baronetcies and knighthoods, known as honors, are purchasable, while it is insisted that places in the public services are not. The distinction, however, is not so clear in the case of peerages, which convey legislative power. There are political writers in England already violently attacking the secret feature of the party system. It is preferable to endeavor to suppose that they are not as bad as Mr. Hillaire Belloc, with evident sincerity, describes them in his recently published book, "The Party System," but he must be considered as speaking with the authority of personal knowledge and experience, after a membership of five years in the House of Commons, when he says:

"It is characteristic that the most important fact about English politics is the fact that nobody mentions. The two party organizations of which we have spoken are supported by means of two huge war-chests. Money is urgently needed at every point in the modern political game, and money is found. Whence does that money come? Whither does it go? These are questions that cannot be answered with any certainty. This is our whole case, that they cannot be answered, . . . but briefly it may be said that they are subscribed by rich men who want some advantage, financial or social, from the Government, and that they are spent in paying the expenses of Members of Parliament. . . . Any

one who has had the good fortune to fight an election, with the party organization at his back, knows that he has only to ask and to have. As a matter of fact, there will never be any lack of funds from any party, so long as each has its fair share of power and patronage. . . . The effect of paying a man's election expenses out of a secret fund at the disposal of the party organizers is that the member becomes responsible not to his constituents but to the caucus. . . . Not one man in thirty knows that there are such things as secret party funds. Not one man in a hundred has the faintest idea of how they are raised and spent. Not one man in a thousand realizes that they are almost the most important factor in English politics. A deliberate reserve is observed on both sides concerning the whole subject. . . . Many rich men subscribe secretly to the party funds, in order to get a measure of control over the machine which governs the country, but often more simply to promote their commercial interests."

These and more pointed criticisms might be cited as evidences that public opinion in England may, before many years have passed, insist upon the adoption of publicity legislation following the lines of that already enacted in the United States.

Our American Campaign Publicity Law undoubtedly assists in the effective operation of what are called corrupt practice laws, but is not a penal statute, as is a corrupt practices act. It is another form of legislation founded upon a different principle, involving the ultimate abolition of secrecy in respect to every use of money for political purposes. Corrupt practices acts are so called, probably, because such laws enacted in our country were modeled upon the Victorian Corrupt Practices Act of 1883, and may be classified as laws to prevent bribery at elections. English corrupt practices acts are drastic and enforced with the greatest severity.

In the French Republic, founded upon universal suffrage; in the German Empire, where a more restricted right to vote exists, though ever extending with the progress of liberalism, under the Imperial Government of Austro-Hungary; in the Kingdom of Italy, in every country of Europe, where varying forms of constitutional government and different degrees of voting privileges prevail, the ballot is protected, more or less successfully, by laws intended to prevent bribery at elections. But, owing to the gen-

eral extension of the suffrage everywhere proposed, or actually carried into effect, and on account of the increasing number of important questions to be decided by popular vote, there is a corresponding and general tendency to larger political expenditures. Secret party funds are considered necessary; their employment is, therefore, tolerated or approved on the Continent of Europe, as in England.

It is a matter of pride that the United States has taken the lead in applying the remedy for an evil everywhere accompanying democratic progress and harassing the onward march of the organized forces of democracy wherever they may be found engaged in a struggle for the recognition of popular rights. The abolition by a Federal statute of the secrecy of party funds during our Presidential and Congressional elections is an accomplished fact, but in order that our country should maintain its pre-eminence, a vigilant enforcement of the law must be demanded by public opinion.

The secret use of money interfering with the free expression of the will of the people at the polls is a menace to representative government, and its preservation largely depends upon the further development of the publicity principle in its relation to political expenditures. This would involve the exposure, discontinuance and dissolution of the alliance between tariff monopolies or other trust combinations and any political party.

The Republican party has remained continuously in power, with but a short interval, since the period of the Civil War and the redistribution of wealth inevitably resulting from conditions following the re-establishment of the Union. That distribution has been fostered by its chief beneficiaries thru the instrumentality of an excessively high protective tariff, maintained by Government favor and political power. During the four years of President Cleveland's first administration, the Senate remained Republican, and for two years only of his second administration were the House and Senate Democratic, and even then a Democratic President and House were not able to secure the desired tariff legislation.

The movement for a Federal campaign publicity law, to be supplemented by similar State laws, originated early in the Presidential campaign of 1904. The propaganda among Democrats then carried on culminated in the charge made by the Democratic Presidential candidate that the trusts were contributing to the Republican national campaign fund. Mr. Roosevelt, the Republican Presidential candidate, declared that Judge Parker's assertions were "monstrous." He denied that the trusts had contributed to his campaign "for the purpose of purchasing immunity," and that he was "unhampered by any pledge." He denounced the charges as "slandrous accusations" and as "unqualifiedly and atrociously false." The reply was framed in a violence of language which has frequently served him on occasions when not desiring to meet the questions at issue.

The issue, then, was that secret contributions had been made to the Republican National Committee by corporations and trusts. Fidelity to excessively high protection and stubborn disinclination to reduce the tariff, even when known to confer special privileges, had given to the Republican national organization and to the trusts all the mutual advantages of a formal alliance. Pledges or formal agreements were therefore unnecessary. In contrast to those transactions the Democratic National Committee had already, at the request of the Democratic Presidential candidate, refused to accept such contributions, and, in addition, the proposition was made to publish all contributions received. The charge that the Republicans had received corporation contributions was not refuted. The subject was avoided and the suggestion in regard to publication was ignored, but this issue, created after the adoption of the platforms, outlived the election.

At the close of the campaign the agitation continued, and public sentiment demanded legislative investigation of the secret contributions by the great insurance companies. The property of policy holders and stockholders in such institutions had been secretly diverted from legitimate channels to political purposes without their knowledge or consent, and

against their own candidates and convictions, if they chanced to be of different opinions from those of the managers of the corporations. Laws prohibiting such contributions were enacted. Upon the initiative of the New York Publicity Law Association, the Albany Legislature of 1906 enacted an effective State publicity law. The bill received the support of both political parties and of the labor organizations of the State. The movement for a Federal publicity law was also non-partisan, but owing to the hostile attitude of the Republican Party represented in the Senate and House, and in its National Convention of 1908, the enactment of the law became a Democratic achievement.

The further development of the publicity principle, in its application to political expenditures, apparently rests with the Democratic party, but at no time in its history has it failed of advocates among leading Republicans. Before his nomination, during the Presidential campaign of 1908, and after his election, Mr. Taft urged the subject upon Congress and upon his party, advocating publicity of contributions and expenditures after, but not before, election. The law as enacted provides publication both before and after election. Representative McCall, of Massachusetts, an influential Republican, presented and powerfully supported the bill in the House. Ex-Senator Chandler is one of the most active and important members of the national publicity law organization. Representative Cooper, of Wisconsin, whose resolution presented to the Chicago Convention of 1908 to include campaign publicity in the Republican platform was defeated, and other members of the party have given the movement valuable assistance. The development of public opinion upon this subject has been so great as to especially affect the insurgent or progressive members of the Republican party in its favor.

Altho distinct progress has been made, much more remains to be done. To have inserted in the bill, in which this subject was first presented, every purpose the Publicity Law Association had in view as its ultimate object, would have been to attempt more than was expedient at the time. The immediate and

pressing necessity is to render the enforcement of the existing Federal law more effective by a provision similar to that contained in the New York law, which has done so much to insure its observance. The New York statute provides for a summary inquest to be held, if necessary, during election. Such inquiries have been undertaken in New York with great benefit. A bill has been introduced in the present Congress having a similar object in view, and it is to be hoped that it will pass before Congress adjourns and the Presidential campaign commences.

It has become a habit of the people of the United States to proclaim their faults from the house tops and in the glaring headlines of their newspapers. They have adopted such methods because of their insistence that laws shall be enforced upon the loftiest standard of honorable dealing in political as well as in commercial and business relations. In no country in the world is the standard held as high as it is in America; and the fact that public sentiment has been aroused in regard to our electoral practices—rather than to our system—does not indicate that politics in America are more corrupt and less inspiring than in other countries, but that the American people insist that their politics shall be *less* corrupt and *more* inspiring.

The appreciation of this fundamental fact is necessary to a clear understand-

ing of the important events now affecting the political and financial interests of the country. It is the reason public sentiment in the United States, in regard to secret party funds, has reached a point so far in advance of other countries, and it is assurance that it will carry on the work to its completion.

Tho deep-rooted, it is not a very long-established evil against which we are contending. As in the countries of Europe, the enormous increase in political expenditures is a matter of recent years. The amount subscribed to Mr. Lincoln's campaign was only about \$100,000, while a single contribution to the Republican fund in 1904 was more than double that amount. The possibility of ultimate control which might thus be obtained and exercised over trade and commerce, and over political organizations and party policies, is incompatible with the healthy commercial and political life of the nation.

A new standard has been established, by which all subscriptions for political purposes are held to be intended for public purposes, publicity being the test of their propriety. Every patriotic American should add his individual effort to secure the perfection of the law and its effective administration. It concerns the rights and the honor of every citizen and demands the active co-operation of all.

WASHINGTON, D. C.

The Crowd of Witnesses

BY EDITH M. THOMAS

THEY are withdrawn—and they are near;
No eyes—they see; no ears—they hear;
They speak together, without sound—
They Who Look On, while Time runs round!

I know not where their place, their stand,
Nor of the distance that is spanned,
When they their influence impart—
They Who Look On and ease my heart.

They ease my heart, for they can take
From Life all fever, all heart-ache;
In any crowd or turmoil rude,
They Who Look On make Quietude.

And sweetly do they send reproof
To turn me from world-pride aloof;
Nor any scorn can strike, nor hate—
They Who Look On so guard my state!

Not safer was the hero caught
In the bright veil Love round him wrought
To bear him from the press of foes—
They Who Look On thus round me close.

I deem they will abide with me,
Perchance, apparent they will be
When I shall breathe my last of breath. . . .
They Who Look On have looked past Death.

NEW YORK CITY.

Our Monetary System

Part III. The Proposed Plan of Reorganization

BY NELSON W. ALDRICH

SENATOR FROM RHODE ISLAND AND CHAIRMAN OF THE NATIONAL MONETARY SYSTEM

THE financial interests of this entire country depend, today, in times of trouble, upon what is popularly known as "Wall Street." Those critics who express fears that any plan of reorganization of our monetary system will in some way permit of encroachment and future domination by New York seem to lose sight of the fact that the domination by New York is an absolutely assured fact, today, under our present system; that we are now staking the safety of all of our banking resources on the patriotic character and business ability of the bank managers of New York, even while their hands are tied in emergencies by the restrictions of a defective system and unwise laws.

As a matter of fact, it is this very domination which it has been one of the great efforts of the Monetary Commission to absolutely eradicate. The responsibilities of continuing this control are too enormous, the costs of failure too great, for the condition longer to be tolerated. And in my judgment the only effective remedy for this dangerous condition will be found in the organization by the National Government of an association along the lines in the suggested plan, called the National Reserve Association, with branches which will be relief centers at various points thruout the country, each with local self-government, which will have for its first and prime purpose to place the banking business of the country in such a condition that there can be no general suspension of banking institutions and no general suspension of their credit functions.

Further than this, it was evident from the first that we could not and should not adapt to our use an organization like the central banks of Europe, or like the Second Bank of the United States, now famous in history. We cannot afford to overlook the prejudices of the past or of

the present. There must be no possibility for transactions of the character which wrecked the Second Bank of the United States. And it is only one who has never studied the proposed plan, who has never absorbed enough information on the subject to comprehend its meaning, and who has no adequate knowledge of the nature of the defects of our present system and what we must do to cure them, who can say that this is a matter to be decided from a political standpoint or for the advantage of person, clique or party.

The plan suggested provides for the organization of all the banks in contiguous territory into local associations, then of the local associations into district associations, and of the district associations into the Reserve Association. In each district association there will be a branch of the Reserve Association. These separate organizations are quite analogous to our political divisions into counties, States and the United States. Each has distinctive functions unlike in their character, and the form of all is based on the idea of securing representative self-government to each. In the local association each individual bank is the voting unit. A majority of the individual banks, without reference to their size or to the stock they hold in the Reserve Association, elects three-fifths of the directors. The majority of the stock interest elects two-fifths.

This form of organization and method of election is, so far as I am aware, quite novel in corporate government. It is more democratic in form, more liberal, than any other that I know of. If advantage accrues to any it is of course to the smaller banks, because it will be possible for them to elect a majority of the directors in every local association in the United States.

The organization suggested is a co-

operative union of all of the banks of the country. It is not an organization to do a general banking business, but a federation of banks for purposes strictly limited to two functions which are clearly defined. One of these functions is to hold a portion of the cash reserves of the banks of the United States with provisions for their mobilization and use for specific purposes. The other is a grant of power for the issue of circulating notes under strict governmental supervision and regulation. Everything else is incidental and collateral to these two main objects, and the business of the Reserve Association is absolutely confined to these two, with the exception of the Government's relations to it as a depositor, and the receiving and paying out of Government funds.

It is proposed that the Reserve Association, thru its branches, shall forward its circulating notes free of cost, upon the request of any subscribing bank, and these notes in the hands of the bank are to be counted as part of its legal reserve. This cannot fail to protect and give vital efficiency to the reserves of all subscribing banks. The very knowledge of the existence of this unfailing source of assistance and support will do more than anything else can do to create public confidence and allay excitement in periods of depression and distrust.

These branches of the Reserve Association, scattered over the country, are to hold the reserve balances of the banks in their district, to rediscount the paper that is offered in various prescribed forms, and to distribute the notes of the Reserve Association free to all the banks of their district, upon application. These are the only functions of the branches of the Reserve Association. They are to serve neighbors, not the whole country. They have no customers except the banks—the banks in their locality. They cannot compete with banks because their functions are not along competitive lines. They are not in any sense branch banks. They are simply branch offices of the Reserve Association.

The incalculable benefit to rural banks of membership in the Reserve Association is the absolute assurance that their reasonable demands for credit and currency will always meet with immediate response—a benefit which under some

conditions has meant the difference between solvency and bankruptcy. It is the benefit which will arise from its insured ability to take care of its customers—those who are entitled to be taken care of—at all times and under all circumstances. It is the benefit which will arise from a knowledge on the part of the public of the existence of a supreme, unfailing resource with the power and the obligation to conserve and protect the best interests of the banks and the depositors alike.

The proposed organization is, in effect, an extension and an evolution of the clearing house plan modified to meet the needs and requirements of the entire country, to maintain the integrity and independence of existing banks, State and National. It is outside of and in addition to the existing system. Both in ownership and business it is confined strictly to banks and the Government. It accords equality of privileges and advantages to all banks, great and small, wherever located. The Reserve Association will have the right and power to fix the rate of all rediscounts—a rate of discount which will be uniform thruout the United States. So far as the Reserve Association is concerned and its control over the matter, every local bank in the country will be entitled to the same rate of discount as the largest bank in Chicago or New York. And this is as it should be. The farmer, the producer in every part of the country, is entitled, thru his local bank, to equal facilities and equivalent rates, in so far as the great national organization is concerned, to those afforded the most favored class in any community. The tendency of this enforced uniformity will be to insure greater steadiness and reasonableness of rates everywhere.

This plan absolutely takes away from New York and other large cities which have enormous accumulations of capital the power to say to the smaller city banks and the rural banks what rates they shall pay for the rediscounts of their paper or whether the accommodations that are so essential for their existence and development shall be granted at all. It puts into the hands of friends and neighbors in each community the power to say how the great mass of cash reserves shall be used. It is a combination and con-

centration of reserves that will be available for every member of the association, wherever located. It will enable the banks of a community to keep the surplus money of the spring and summer—the money which now must find its way to New York, and there, as a business necessity, must be loaned out on the Stock Exchange—it will enable communities to keep it and invest it at from 3 to 4 per cent. in commercial paper based upon the products and industries of the locality. It will result in having foreign bills drawn in dollars and cents as against the bills which are now drawn in the money of France, Germany and England. It will put the securities growing out of our local industries where they belong—on a par with the best foreign bills now sold in London, Paris and Berlin. It makes Chicago, Kansas City and every other locality essential parts of a complete system worthy of this great country of ours. In this way the Reserve Association will do more than can possibly be done in any other way to give every section of the United States an equality which is vital to development, industrially, agriculturally, and in every other respect.

I do not believe that the New York banks are especially anxious for the reserve deposits which now are thrust upon them; but they are obliged to take them and then do something with them—and the only course lying open to them under existing conditions is to loan them on stock exchange collaterals, usually at a very low rate of interest. There are few bankers who will not be better satisfied, and better off, with the assurance of being able to invest their funds at a steady rate, much lower than the inflated rates which in many cases are now current.

The organization is of a form and character which will effectually prevent the control of its operations by any external influence, political, personal, local or national. It is pertinently an enlargement of the clearing house idea, and I have never known politics or differences of opinion growing out of the size of a bank or its location to enter into the selection of the management of a clearing house association. In fact, this is not at all a political question. It is simply and purely a business question. The governor of the Reserve Association should

be appointed by the President from a list submitted to him by the directors, but the deputy governors and all the other officials should be elected by the directors, who are themselves elected by local votes from every local district in the country. I believe that the Secretary of the Treasury and the Secretary of Commerce and Labor and the Comptroller of the Currency should be ex-officio members of the board of directors of the Reserve Association, to secure a proper recognition of the vital interest which the public has in the management of the institution. It is of course a corporation of private stockholders, but it is proposed to make it the principal fiscal agent of the United States and the depository of its funds. The more important functions of the organization and its principal powers are of a public or semi-public character. It is not only the custodian of the Treasury balances, but the chief reason for its existence is found in its ability at all times to sustain the public credit; while neither the President nor any of its officials, from the inherent character of the institution, could possibly use its functions for personal or political purposes.

According to the proposed plan, the banks are to be the sole owners of the organization, holding the stock in proportion to their capital and circulation, with State banks and trust companies admitted to membership on equal terms, under provisions which co-ordinate the conditions of membership of all banks in each locality, with a system of thorough examination by local expert examiners of each district, uniform as to all banks, which I believe will insure better results in the ascertainment of actual conditions than can now be obtained thru either national or State requirements. The publicity required will prove a basis of public confidence, and a great advantage to well managed institutions. Some of our banks now have to submit to three or four examinations a year, which is not only burdensome but unnecessary and expensive. We propose to concentrate these examinations so that they will be more effective and of recognized value to all concerned.

While the banks are to be the sole owners of the Reserve Association—with no one else allowed to hold stock in it—

they can receive but five per cent. on the investment. All profits beyond this will revert to the Treasury of the United States. And as the result of close computation made by experienced bankers, it is estimated the Government will receive at least fifteen millions per annum, from the start, as a contribution to the revenues of the country. In connection with this point it is pertinently asked: "What would New York, or any other part of the country, do with the institution, even supposing that control of it could be secured?" They could not make any money out of it, because all of the profits over five per cent. go to the Government. They could not control the discounts because they are controlled by the district organizations. The only way that control of the cash reserves of the country could be obtained would be by gaining control of every local organization and of every district combination of organizations, and then of the Reserve Association itself, which would mean the outlay of the larger portion of five or six thousand million dollars—and as a matter of fact could be of no possible benefit if obtained, taking into consideration the distribution of functions and limitation of powers provided.

The proposed plan also authorizes the organization of banks in foreign countries to assist in the extension of our international trade, which will be invaluable to our commercial interests. The methods by which our credit operations are now conducted abroad are crude, expensive, and unworthy of an intelligent people. We are the first country in the world in financial resources. We have natural resources vastly greater than any other country. We pride ourselves on the intelligence and energy of our people. It is humiliating to think that we who have accomplished so much should be still clinging to these antiquated methods, which have long since been rejected by every other great commercial nation of the earth and that we should be paying millions of dollars a year to foreign banks to transact for us our financial operations.

The third function of the Reserve Association, the issue of notes, is the one which makes directly for our internal prosperity in the prevention of finan-

cial disturbance and panics. It is proposed to adopt the same system with reference to the basis of note issues and to their redemption that is adopted everywhere else in the world—in all other countries. Instead of having notes issued by individual banks, as they are now, based upon Government bonds, it is proposed to stop the issue of bond-secured currency entirely. As a matter of fact, it will have to stop soon in any case, from natural causes. We have practically exhausted all of the available bonds.

I have already explained how defective the system has been in that it has never responded automatically, by expansion and contraction, to the business needs of the country. It is an absolute necessity to our safety in business that we have a currency which will so respond, and will be based upon gold or other lawful money, and upon commercial paper of a proper character, and that will be redeemed in gold or its equivalent at all times and at every branch of the Reserve Association thruout the country. We propose that these notes shall be sent free of cost to any individual bank upon its balance with the district branch of the Reserve Association. So that there will be hardly a bank in the United States which will be twenty-four hours away from a positive supply of notes at any time when they are required. These notes will be guaranteed, first, by a first lien upon all of the assets of the organization; second, by the deposits of gold or other lawful money; third, by short-time commercial paper. I believe that this is universally considered, in all countries of the world, by all economists and students and practical men, to be the best possible basis for note issue.

Thus the issue of notes will be confined to one institution, whose function it is to issue, not to hoard them; where now it is exercised by seven or eight thousand individual national banks over the country, each with its own private interests at stake, and upon an absolutely inelastic basis. Instead of having the notes issued by the individual banks, they will be issued by the banks collectively—by the co-operative organization of banks, for the mutual good of all, including in its basis the cash reserves of all the banks with every element which the ex-

perience of the world has shown to be necessary as the basis for an absolutely sound currency, positively preventing money panics and all the disasters and losses following in the wake of financial disturbances.

It is well worth the while of every citizen of the United States to take personal

interest in this matter, to study and understand our present deplorable condition, and to avail himself of every opportunity to add his influence to the effort to accomplish a reform of our methods; for his own safety and prosperity and for the good of the whole country at home and abroad.

PROVIDENCE, R. I.

Privilege Becomes Property Under the Fourteenth Amendment*

II. The Consolidated Gas Decision

BY JESSE F. ORTON, A.M., LL.B.

[This is the latest in our series of articles begun by the publication on April 18, 1908, of an article by President Hadley, of Yale University, entitled "The Constitutional Position of Property in America." We comment on this article in the editorial pages.—EDITOR.]

IN THE INDEPENDENT for October 12, 1911, I discussed one feature of the Consolidated Gas Case,¹ showing how the United States Supreme Court confirmed the company's right to earn dividends on \$7,781,000 of "franchise value." There are two other points in the decision of even greater importance, involving the right of the company to receive an income on more than \$13,000,000.² It was claimed that this was part of the company's "property," on which the State could not, by regulation of rates, prevent the making of a reasonable profit. In other words, it was alleged to be property of which the company could not, under the Federal Constitution, be deprived "without due process of law."

Some preliminary explanation is necessary. As the courts construe the Federal Constitution, State legislatures and commissions and city councils must allow public service corporations to charge rates yielding a fair return on

the property "devoted to the public use." The method of determining the value of a company's property used for a public service has, therefore, been a matter of prime importance. Was this "property" the total amount of securities issued by the company? Was a corporation entitled to charge rates yielding an income sufficient to pay interest on its bonds and a fair dividend on its stock? This theory, tho put forward in some early cases, received no permanent recognition. The absurdity of making the people pay dividends on whatever paper a company had seen fit to issue was soon apparent, in spite of the plea of "innocent purchasers."

Next came the "original cost" or "actual investment" theory,³ according to which an income might be earned on the amount invested in cash or in equivalent property. There were strong arguments in support of this method. It allowed an income on what individuals had really parted with, and no more. It had the advantage of simplicity and certainty, provided the books of the company were correctly kept; for the books would show the amount of money paid in and the cost of the various items of property. And if a public utility enter-

¹Consolidated, 1912, by Jesse F. Orton.

²197 Ind. Rep. 846, 212 U. S. 19.

³The exact amounts of the two items making up the total were not determined by the court; and the company presented little evidence for the purpose of showing the amounts. The figures used here are taken from the brief filed in the Supreme Court on behalf of the city by its Corporation Counsel, Francis K. Pendleton, now a Justice of the New York Supreme Court, and ex-Judge Alton B. Parker. They seem to be sustained by the evidence in the case, and are more conservative than those contended for by other eminent counsel representing the defendants.

³Cost and investment are the same thing, of course, if the money paid in by stockholders is neither stolen nor wasted but is invested in property or services.

prise were launched judiciously and conducted properly, the payment of rates yielding dividends on "actual cost" would seldom be an unreasonable burden.

But many public utilities were not launched judiciously or conducted properly; and the total of so-called "actual investment" was often far above legitimate capitalization based on value. The "investment" was often excessive, even when the management had been fairly efficient and free from speculation. An illustration will make this plain.

Suppose that a gas plant has been built at a cost of \$1,000,000; that annual repairs require 1 per cent. of the cost, or \$10,000; that there is a further annual depreciation of 2 per cent., or \$20,000; and that the income of the company, after paying operating expenses, is 10 per cent., or \$100,000. Under proper management, of course, 1 per cent. would be expended each year for actual repairs; 2 per cent. would be set aside in a "depreciation fund," to be used for rebuilding the plant when worn out and for replacing certain parts from time to time; and not more than the remainder of the net income, or 7 per cent., would be used in paying dividends. But the practice of many public service corporations has been to pay in dividends not only the 7 per cent. really earned, but also the 2 per cent. required to offset depreciation and sometimes part or all of the 1 per cent. needed for current repairs.

Years afterward, when a new plant must be built or the old one be brought to a state of efficiency, the cash is obtained by selling more bonds or stock. Thus the security holders may have "actually paid in" \$2,000,000, altho the plant is still worth only \$1,000,000, the explanation being the payment of unearned dividends equal to \$1,000,000. If the business is unprofitable, as a result of unwise planning or dishonest or inefficient management, the same result may be reached without the payment of dividends, new capital being required to provide for repairs and depreciation in the absence of income available for those purposes.

It became clear that, under conditions often prevailing, the amount of money

"actually invested" was a wholly unjust measure of the income deserved, and that this standard, as a hard-and-fast rule, was an impracticable one by which to limit the power of the State to regulate rates. It was also perceived that, so far as depreciable property was concerned, like buildings, tools and fixtures, it was usually impossible to tell what the "original cost" had been, impossible to draw the line between new capital legitimately supplied for improvements or extensions and that improperly applied to repairs or replacements.

In view of these objections to "cost" or "investment," it was proposed to adopt the "present value" of the company's property as a standard, to be found by appraising the property on the basis of the cost to reproduce it and then deducting a suitable amount for "accrued depreciation." It was not clearly seen that "original cost" is in many ways the best standard obtainable, and that if it could not be retained as a fixed and invariable rule, it could and must still be used, to prevent gross injustice, in fixing the value of certain kinds of property for rate-making purposes. Public service corporations were not slow in seeing the advantage to be gained by insisting on a strict application of the "present value" standard; and the tendency of many courts has been toward its adoption as the sole "property" test of the constitutionality of rate regulation, altho in the leading case of *Smyth vs. Ames*⁴ the United States Supreme Court said that several other things might be considered, including "original cost of construction."

We now take up the two points above mentioned, arising in the Consolidated Gas Case: (1) as to the valuation of land, and (2) as to the valuation of pipes under street pavements.

1. *Valuation of land used for a public utility.* The "present value" standard was expected to save the public from fraud and injustice in fixing the capital value of buildings, machinery, railway tracks, water or gas pipes—in brief, property subject to wear and tear. The application of the rule to the valuation of land was wholly unnecessary; land does not wear out or have to be re-

⁴169 U. S. 466.

paired, and if it becomes unsuitable for use by a public utility it can be sold for another purpose.

The original companies whose franchises passed to the Consolidated Gas Company in 1884 began business at various times from 1823 on. It appeared in 1906, according to the findings of Judge Hough in the United States Circuit Court, that the value of the company's land was \$11,985,435. But this land appears to have cost the gas companies, at the times of purchase in earlier years, a total of not more than \$4,118,267. \$7,867,168 had been added to its value by the growth of New York in population and industry.⁵ Were the gas consumers required by the Federal Constitution to pay such rates as would yield dividends on nearly \$8,000,000 which the company had never invested? They are now paying such rates, and both Judge Hough and the United States Supreme Court say they must continue.⁶

The question was not whether the company should be recognized as the owner of this value and entitled to sell the land for its market price whenever it discontinued the gas business. The question was, Shall the people of New York, after creating this value by their presence and industry, be required to pay to those who have not created it an annual income upon it in the form of rates for a public service?

Governments exist for the performing of public services; they occupy the position of trustees for the benefit of the people, bound to furnish or secure the desired service at the lowest practicable cost. Certain services are inherently public because they at once require the use of public property, inevitably become monopolies in private hands, and are universal necessities. Such are the services furnished by street railways, gas, water and electric plants, telephone systems, etc. As to these services, the government may adopt either of two courses; it may provide the service itself

and make a charge sufficient to cover the cost, or it may license private parties to provide the service under the control of government and make a reasonable charge therefor. What is a reasonable charge? The only possible answer is, the lowest charge that will secure the desired service; the government is a trustee for this very end and is recreant to its trust if it permits a private purveyor of a public service to impose a higher rate.

It is clear that dividends on any increase that may occur in land values are not necessary, in order to attract capital for the furnishing of gas or other public utilities. The reasons are obvious.

(a) The fact and the extent of such increases are largely fortuitous; at least, any great increase is seldom certain when the land is purchased and business begun.

(b) Without any dividends on increase of land value, a public service corporation derives as great a benefit from the general industrial fact that land values may increase as is derived by private business enterprises. The courts uphold public utility rates yielding an income equal to the percentage generally obtained by successful private enterprises of a similar character *upon their original investments*,⁷ and the general fact of possible increases in land values will certainly be reflected in this customary rate of profit. To allow this percentage to be reckoned on a capital greater than the amount invested in a public utility would be to place the utility corporation in a position more favorable than that occupied by the ordinary private enterprise of a like character.

(c) By denying to a public service corporation profits on the increase in the value of its land the court would not prevent it from receiving a great advantage from such increase. It would be the owner of that value, the taxes thereon being paid each year by its customers

⁵See note 2.

⁶The statement by the Supreme Court may be considered an *obiter dictum*. The suit of the company, sustained by Judge Hough, but reversed and dismissed by the Supreme Court, might have been dismissed without any statement as to the valuation of land. But this dictum will be followed by many inferior courts until the higher court makes a contrary ruling.

⁷Judge Hough, after stating that "an interest in the gas business" of New York "is as nearly a conservative investment as any private manufacturing enterprise can furnish," decided that a "prudent man acquainted with business," if offered such an investment, would take it on a 6-per-cent. basis, and would be legally entitled to that rate in spite of legislative regulation, because that "is the return ordinarily sought and obtained on investments of that degree of safety in the City of New York." The Supreme Court affirmed the decision with reference to this point on the reasoning employed by Judge Hough.

as a part of its operating expenses. To make the people pay dividends as well as taxes on a value which represents a pure windfall to the company and is a result of the whole community's growth and industry,⁸ cannot be considered necessary in order to secure the service which the company furnishes.

In support of his holding that the people must pay profits on money which the Consolidated Gas Company never invested, Judge Hough says:

"If fifty years ago, by the payment of certain money, one acquired a factory and the land appurtenant thereto, and continues today his original business therein, his investment is the factory and the land, not the money originally paid; and unless his business shows a return equivalent to what land and building, or land alone, would give if devoted to other purposes (having due regard to cost of change), that man is engaged in a losing venture, and is not receiving a fair return upon his investment, that is, the land and building."

The reader will see that Judge Hough ignores the vital and controlling feature of the case, the difference between purely private enterprises and public services. The "return" must be "fair" to the people as well as to the corporation; and anything above what is necessary to attract the needed capital is unfair, a special favor conferred by government, in violation of its duty as trustee for all the people.

It is sometimes said that a company should be allowed to earn an income on the appreciated value of land because it may be required to accept a return on a depreciated value not only for land, but also for buildings, machinery and other similar property. Thus Judge Hough says:

"Nor can it be inferred that such government (any American government) intended to deny the application of economic laws to valuation of increments earned or unearned, while insisting upon the usual results thereof in the case of equally unearned, and possibly unmerited, depreciation."

In case land has decreased in value since its purchase and the deficiency has not been made good out of earnings, of course the original cost should be taken as a basis in determining reasonable rates, provided the purchase was proper and made at a fair price. The resulting

public losses would be rare and comparatively insignificant. As to other property, the argument will be seen to have no foundation if it be remembered that the company is allowed not only to make repairs out of income, but also to set aside a sum equal to the annual depreciation from such causes as can be foreseen, all in addition to receiving a fair return. If there are any dangers of loss that cannot be foreseen, any risks which make the investment less safe than a good mortgage, for example, the company is allowed a percentage of profit large in proportion to the risks assumed. In this case Judge Hough made an allowance for "depreciation," to be taken out of income as a part of the expense of the business; and he named 6 per cent. as the proper rate of return in view of the risks incurred by the company.

The Supreme Court seems to uphold Judge Hough's ruling as to the increase of land value shown in this case, while not committing itself as to such increase in all cases. The court says:

"We agree with the court below in holding that the value of the property is to be determined as of the time when the inquiry is made regarding the rates. If the property, which legally enters into the consideration of the question of rates, has increased in value since it was acquired, the company is entitled to the benefit of such increase. This is, at any rate, the general rule. We do not say there may not possibly be an exception to it, where the property may have increased so enormously in value as to render a rate permitting a reasonable return upon such increased value unjust to the public. How such facts should be treated, is not a question now before us, as this case does not present it."

The *amount* of the increase in land value would seem to be immaterial, except that the public hardship would be greater in case of a large increase. And the increase in this case is not small, a matter of about \$8,000,000, nearly one-seventh of the company's property as reduced by the Supreme Court.

Thus, without vouchsafing any reason for "the general rule" or any practical clue to the possible "exception to it," and with nothing but a cursory reference, the Supreme Court dismisses the subject. Whether its language amounts to mere *dictum* or is settled law, the State and City of New York, and all other States

⁸The Consolidated Gas Company's counsel, in speaking of the increase in the value of the company's land, said: "It is due to Divine Providence and the growth of the City of New York." (Printed Record, p. 2833.)

⁹See note 6.

and municipalities, are practically given notice that they must allow the earning of dividends on capital amounting to hundreds of millions of dollars, which no company ever invested or produced.

2. *Dividends on cost of city pavements.* It often happens that a gas, water or electric company places its pipes or wires under streets before they are paved or while they are paved with a cheap material. In due time the city paves or repaves the streets, laying down perhaps "asphalt over concrete" or "granite block." If the company were to lay the pipes or wires over again, removing and replacing a costly pavement and having to contend with a greater accumulation of fixtures under the street surface, the cost would probably be much greater than the original cost of putting them in, or the present cost if the original conditions still existed. In other words, the "reproduction cost" of the company's property has been vastly increased by expenditure of the taxpayers' money.

Shall the gas-consuming public pay dividends to the company because the people have covered the company's pipes with good pavements? It is difficult to see how the proposition can be taken seriously; yet it has been boldly argued by companies' lawyers and has received the approval of judges.

It appeared that the reproduction cost of the Consolidated Gas Company's mains and service pipes would be greater, by \$5,555,761, on account of the changed conditions in the streets, chiefly new paving.¹⁰ These improvements did not belong to the company, and it had paid nothing on account of them. Nevertheless, Judge Hough decided that the people must pay dividends to the company on this immense sum. He said:

"If it be true that a pipe line under the New York of 1917 is worth more than was a pipe line under the city of 1827, then the owner thereof owns that value, and that such advance arose wholly or partly thru difficulties of duplication created by the city itself is a matter of no moment."

Shall the standard of "present value," after being used to prevent injustice in one direction, be allowed to become the instrument of equal or worse injustice in another direction? Is it a "matter of

no moment" that the people are taxed to lay pavements, and then pay an extra gas rate equal to 6 per cent. or more on the value of the improvement? They also pay, as part of the company's operating expenses, any incidental increase in the cost of repairing mains and pipes under the pavements.

The United States Supreme Court did not either repudiate this doctrine or give its express approval. It said, as already quoted:

"If the property, which legally enters into the consideration of the question of rates, has increased in value since it was acquired, the company is entitled to the benefit of such increase."

While there is room for argument that when the court used the words, "property, which legally enters into the consideration of the question of rates," it did not refer to such a value as that arising from improved pavements—yet this language of our highest court is constantly being urged, by counsel for public service corporations, upon courts and commissions throughout the country, as an undoubted approval of the holding of Judge Hough. In certain quarters it may be accepted in that sense, and the people interested will have to take their case to the United States Supreme Court—if, indeed, they can get it there—to find out what that court meant.

Judge Hough thought the 80-cent rate would produce a net income of about \$3,000,000, slightly more than 5 per cent. on the value of the company's property and franchises, placed by him at nearly \$60,000,000. He held the rate unconstitutional because it would not yield 6 per cent. The old rate, \$1 per thousand, was yielding nearly 10 per cent. Curiously, enough, Judge Hough, as he himself tells us, allowed "nothing for increase of sales due to cheaper prices." Why did he not make allowance for this? On appeal, the Supreme Court said:

"A reduction in rates will not always reduce the net earnings, but on the contrary may increase them."

Even tho the reduction from \$1 to 80 cents might not actually increase net earnings, it was certain that the lower price would cause an increased consumption of gas and thus offset, in whole

¹⁰See note 2.

or in part, the loss of income due to the reduction.¹¹

The Supreme Court cut down Judge Hough's valuation of the company's franchises from \$12,000,000 to \$7,781,000. This left the total investment less than \$56,000,000, on which the net income anticipated by Judge Hough would be nearly 5½ per cent. While agreeing that the company was entitled to 6 per cent., the Supreme Court reversed the Judge's decision and compelled the company to make a trial of the new rate, to see whether, with the increased consumption of gas due to the lower price, it would not yield 6 per cent. It has undoubtedly yielded 6 per cent. or more; the company has made no attempt to reopen the case and show that it found the rate insufficient. The Supreme Court was also influenced by a doubt whether Judge Hough, relying upon the testimony of expert witnesses furnished by the company, had not fixed the value of the tangible property at too high a figure.

If the court had eliminated from the total of the company's investment (1) all franchise values, (2) the increase in the value of the company's land, and (3) the alleged increase in the value of mains and pipes due to better pavements, these items amounting to more

than \$21,000,000, the capital would have been reduced to about \$34,500,000, on which even Judge Hough's estimated net income would have been 8.79 per cent., with a still higher percentage to be earned thru increased consumption.

The rate should be further reduced to a figure that will yield no more than 6 per cent. on the company's fair capitalization.¹² The Supreme Court should have another opportunity to pass on the franchise value supposed to have been authorized by the Legislature of 1884. It should have a chance to reconsider "the general rule" as to increase in land values, and, incidentally, to say whether an increase of nearly \$8,000,000 is not "enormous" enough to make payment of dividends on it "unjust to the public." It should also say definitely whether the people must pay dividends on value created solely by the expenditure of taxpayers' money in the laying of pavements.

In the Supreme Court the opinion was written by Justice Peckham and received the concurrence of all the other members, Chief Justice Fuller and Justices Harlan, Brewer, White, McKenna, Holmes, Day and Moody.¹³

ELMHURST, N. Y.

¹²It should be noted that 6 per cent. on the entire value of the property is equivalent to 7 per cent. for the stockholders, if they have issued bonds at 5 per cent. equal to half that value. No opinion is here expressed as to the propriety of 6 per cent. as a rate of return in this case.

¹³Since the decision of this case the court has lost five of its members, Chief Justice Fuller and Justices Harlan, Brewer, Peckham and Moody. Justice White has been made Chief Justice and Justices Lurton, Hughes, Lamar, Van Devanter and Pitney have been appointed.

The Sun

BY THOMAS E. BURKE

Who cometh up from Edom dyed in gore,
From Bosra with apparel hectic red,
Why drip thy stately vestments even more
Than robes of them that in the wine-press tread?

"Behold I come all garmented in blood
And thru the pathless blue I take my way,
To consummate upon the western rood
The sanguinary sacrifice of Day."

NOTRE DAME, IND.

¹¹This is shown by the experience of the company since the eighty-cent rate became effective by the Supreme Court's decision (January 12, 1909). Under the dollar rate the consumption of gas, from 1905 to 1908, showed an average annual increase of only 366,000,000 cubic feet. Under the eighty-cent rate the consumption increased 937,000,000 cubic feet in 1909, and there was a further increase of 726,000,000 feet in 1910.

Waste

BY WILLIAM B. BAILEY, Ph.D.

ASSISTANT PROFESSOR OF POLITICAL ECONOMY IN YALE UNIVERSITY.

WE take great pride in the fact that we are the richest nation in the world, and it has been only within comparatively recent years that we have taken a serious interest in the conservation of our resources. By forest fires, wasteful mining and unscientific agriculture, we have destroyed untold wealth. The preventable waste thru sickness reduces the earning capacity of our people by hundreds of millions of dollars annually. But there is another form of waste which does not receive the attention which it deserves. This is the expenditure of vast sums of money for purposes which leave us in a worse condition than before this money was spent. The expenditure of our Government in preparation for and as a result of war amounts to about \$400,000,000 annually. In addition to this we expend nearly \$3,000,000,000 a year upon intoxicating liquors, to-

bacco, coffee and tea. It is almost impossible to obtain accurate figures for our expenditures upon these articles, but from figures furnished by *The American Grocer* and from an estimate made independently for the expenditure on tobacco we obtain the following:

Liquor	\$1,600,000,000
Tobacco	1,100,000,000
Coffee	194,000,000
Tea	33,000,000

The unfortunate part of this expenditure is that not only is this vast sum unprofitably consumed when it might be expended for articles which are needed by our people, but the money spent upon these items reduces the power of resistance to disease and brings an incalculable amount of misery in its train. In our campaign for conservation the personal habits of the people should not be overlooked.

NEW HAVEN, CONN.

Literature

Evolution

MOST biologists accept the view that the conditions suitable for the origin of life existed ages ago when the earth had cooled to a certain temperature, but that such conditions do not ordinarily recur in nature, and that they have not been reproduced artificially. Dr. Bastian,¹ however, has spent much of his energy during the past forty years trying to convince the biologists that life is constantly arising anew. Earlier experiments led to the conclusion that our simplest microorganisms do not arise "spontaneously" in solutions of nutritive matter; Pasteur, Tyndall and Koch settled no doubt for all time, the principle of "sterilization," upon which so much of our surgical and sanitary practise today depends. But Dr. Bastian goes on with his experiments, unperturbed by the rebuffs of scientific societies or the criticisms of his colleagues, with a devotion that is admirable, tho misguided. He places various mixtures of inorganic compounds in flasks, with water, heats these to a temperature far above that generally acknowledged to be sufficient to destroy all living matter, and allows the sealed preparations to stand for weeks, or months. Upon opening the flasks under conditions that guard against the entrance of organisms from the air, he finds organized bodies that strongly resemble certain lower forms of plant life. Granting Dr. Bastian all that he claims for the precautions against the invasion of his cultures and preparations, and granting him all that he claims for the appearance and structure of his new discoveries, his story is far from convincing. His preparations contain no carbon; the "organisms" which arise "spontaneously" in his preparations contain silicon in place of carbon. From all that we know of living things, life depends upon the ability to liberate energy through the oxidation of carbon

compounds. Now, if Bastian's organisms oxidize silicon compounds instead of carbon compounds, the product of this oxidation cannot be eliminated, and the "life" of the organism is "self-limited" in a way that is just the opposite of what we find in ordinary living things. Dr. Bastian writes with remarkable clearness and simplicity, and his books—he has written several on this subject—must impress the layman very favorably. The plates are good reproductions from photographs of the "organisms" as seen thru the microscope, and some of them certainly have a startling similarity to organisms that originate in the orthodox way. It is likely that the final value of Dr. Bastian's work will lie in leading scientific men to recognize that what we term "life" is but a special phase of a whole class of phenomena; that other types of life and metabolism are possible, at least theoretically, and that they do not exist upon this earth because our atmosphere and temperature cycles and chemical environment are what they are.

All evolutionists assume the early origin of life upon this earth, or at any rate its early arrival upon this earth; their chief concern is with the forces that have brought about the transformations in the species of organisms that have peopled the earth from time to time. The late Dr. Bernard, for many years curator of corals at the British Museum of Natural History, gave much thought to some of these problems, but his manuscripts, in which his views were put down, were not prepared for publication until after his death. The present book² was edited by his daughter. Of the neglected forces in evolution to which Dr. Bernard calls our attention the first is his "protomitomic network," which is offered as a substitute for, or a supplement to, the cell theory. Years ago Dr. Bernard had found that the structure of the retina of the eye did not

¹THE ORIGIN OF LIFE. By H. Charlton Bastian, M.D., F.R.S. 8vo. Pp. iv+119, with ten plates. The Science Series. New York and London: G. P. Putnam's Sons. \$1.50.

²SOME NEGLECTED FACTORS IN EVOLUTION, AN ESSAY IN CONSTRUCTIVE BIOLOGY. By Henry M. Bernard, M.A., F.Z.S. Edited by Matilda Bernard. 8vo. Pp. xxi+489. Illustrated. New York and London: G. P. Putnam's Sons, \$3.

agree with the current idea that every tissue is a composite of cells; others had about the same time been impressed with the "inadequacy of the cell theory," and Bernard generalized his observations into the view that the protoplasmic network is continuous thruout the organism. Many other biologists have made similar observations and generalizations. The best formulation of this point of view is perhaps DeBary's dictum, "The organism builds its cells, not the cells the organism." The nuclear network, extending thru the organism, divides its material frame into convenient cells.

Bernard's second principle is that evolution proceeds in a given plane up to a certain stage; further evolution means action in a new plane. Concretely, new types of units arise from the integration of units of a lower type. Thus, the chromidial units form cells; cells aggregate into units of the "gastræa" type, made famous by Haeckel, and represented in the animal world by such organisms as hydra, corals, sea anemones and jelly-fish. The gastræal units form colonies of the "worm" or annelid type, and evolution here continues up to the crustacea and insects. The back-boned animals are the extreme products of this plane of evolution. The next stage would consist of colonies of organisms of the annulate or vertebrate type, and we have the beginnings in colonies of ants or bees, and in human society. We cannot see that this factor is anything different from Spencer's principle of integration, followed by differentiation. To call it by the name of "colony formation" may simplify it for the general reader, but can not make a new principle of it.

In the course of the ages thru which living beings have tried to live in this world, there have occurred many coincidences. It must have happened many times that an area became gradually flooded, or dried up; that animals have had to depend upon a new type of food; that insects have adopted the water as a convenient breeding place for their young, etc., etc. Dr. Willey³ has

gathered a number of instances of "convergence," or the evolution of similar structures or habits by organisms of different types or origins. Thus the mongoose has a horizontal pupil, like the whip-snake or the horse; other nocturnal animals have vertical pupils; whereas the typical pupil is circular. The most remarkable convergences are perhaps shown by the social insects, of which the termites or "white ants" have no genetic relationship with the true ants, yet resemble the latter so closely in their general appearance and modes of life. To the lover of natural history, as well as to the trained scientist, this book offers a wealth of interesting information. The philosophical introduction is rather disappointing, and may deter many from reading the rest of the book.

There is a real need for a book that states concisely and simply, and at the same time soundly and authoritatively, the present status of the doctrine of evolution. Dr. Crampton's new book⁴ furnishes excellent reading, is crammed full of interesting examples, and is scientific and scholarly as far as it goes. To many people it will furnish just the introduction to the study of evolution that they need. The popularity of Dr. Crampton's lectures in New York City, where he has repeated practically the same series several times each season for five years, would indicate that they fill a real need. But the printed book does not come up to its title. A third of the book is given up to introductory matter and "evidence" of evolution. Less than ten pages are given to the questions that engage most of the time and thought of the active workers in the study of evolution today, and the treatment is such as to leave upon the reader the impression that after Darwin there is little left to do but readjust a few trifles here and there. "The many-sided struggle for existence" and the "elements of the selective process" do *not* enable us to understand what has happened and what is happening in the world of life, as Dr. Crampton would have his readers believe. The researches on Mendelism and mutation

³CONVERGENCE IN EVOLUTION. By Arthur Willey, D.Sc., Lond.; Hon. M.A., Cantab.; F.R.S., Professor of Zoology in the McGill University. 8vo. Pp. 874. With illustrations. New York: E. P. Dutton & Co. 1915.

⁴THE DOCTRINE OF EVOLUTION, ITS BASIS AND ITS SCOPE. By Henry Edward Crampton, Ph.D., Professor of Zoölogy, Columbia University. 12mo. Pp. ix+311. New York: The Columbia University Press. \$1.50.

have already yielded sufficient fruit to entitle them to a rather full recognition in a new book on "The Doctrine of Evolution." A good index would double the value of the book.

Sailor and Author, Too*

Un puissant rêveur, a French critic has written of him; yet, in his own words, "perhaps not such an unconditional dreamer as all that." As Mr. Conrad writes a little further on:

"Even before the most seductive reveries I have remained mindful of that sobriety of interior thought, that asceticism of sentiment, in which alone the naked form of truth, such as one conceives it, such as one feels it, can be rendered without shame."

Some there are who find this sober—and somber—sailor-author the most notable man among all those who are to-day writing English prose. Others, not denying the miracle that has given a foreigner, "who never wrote a line for print till he was thirty-six," wavering even then between French and English, the power to create "The Mirror of the Sea" and "Under Western Eyes," yet hold Mr. Conrad to be as much overrated by the few as slighted by the many. In any case, there can be no question but that this man from inland Poland has had, in rare degree, understanding of the ocean, and the ability to call up in his readers' imaginations sea and ship and seamen. And, whatever one's opinion of his other books, these same readers must inevitably take pleasure in the reminiscences and reflections of the vaguely mysterious author of "Youth" and "Typhoon." It is not an altogether orderly autobiography, but, while far from deficient in literary quality, it is an uncommonly modest one; quite free, also, from all literary affectation. The writer is naturally reticent. He tells more about Nicholas B., an equally taciturn kinsman, who served most honorably in the Grande Armée, than of his own youth in Ukraine, tho he describes a visit paid to his uncle's home there many years after he took up a life of seafaring. Something he tells of a brilliant and unscrupulous stepfather, who cheated his grandfather of his father's

fortune. He writes with feeling of his family's part in the disastrous risings against Russia. Of his father, he tells us at least that he translated into Polish "Two Gentlemen of Verona" and "Toilers of the Sea." He tells us of his friendship with Stephen Crane, "that energetic, slight, fragile, intensely living and transient figure"; and of the dog "with a black head on a white body and a ridiculous black spot at the other end of him," a present of Crane's to his little son. He tells us, too, of the writing of "Almayer's Folly," spread over a long period of time.

Mr. Conrad is a slow worker indeed; he "wrestled" with "Nostromo," he tells us very simply, "for twenty months." One of his rewards is an unsullied literary conscience; and in this *Personal Record*, a book composed in a minor key that contrasts strangely with the stridency of most contemporary literature, there are exquisite pages.

Even as mariner, Joseph Conrad never "went into steam."

Tante. By Anne Douglas Sedgwick. New York: The Century Company. \$1.30.

The thoroly selfish woman has been variously depicted; nowhere better than in that clever play of two seasons ago, *The Mollusc*; but in *Tante* Miss Sedgwick gives a remarkable study of egoism. It is the self-centered musical artist, "the most famous of living pianists," who is the subject of this skillful dissection. Madame Oraska has lived in an atmosphere of adulation until her whole nature has become perverted, and her beauty and genius are sorry substitutes for the endearing small virtues of less Olympian characters. It is not difficult to see how such public entertainers live in an artificial world where incense takes the place of fresh air. They cannot breathe without what they call "sympathy," but which is in reality flattery, and woe to the luckless wight who is too clear-headed or too honest to turn acolyte and swing with the censer! The character of Tante is a triumph of clever and discerning delineation, and that of her adopted daughter Karen scarcely less so. Karen, too, has a rare talent, a genius for gratitude. Her adoration for her guardian is charmingly natural; yet

*A PERSONAL RECORD. By Joseph Conrad. New York: Harper & Bros. Pp. 226. \$1.25.

we wonder why so fine a nature did not feel the unreality and selfishness of the other? It is not often, in fiction at least, that a high-minded hero has to struggle against the exacting jealousy of a foster mother-in-law to keep his wife's affection, when his feminine rival is not satisfied without all of it. There is something quite diabolical in the ingenuity expended by Tante in her efforts to separate husband and wife, because it is a part of her hideous egoism to be wretched without the exclusive adoration of everyone about her. We have known her—the woman who must be first, who flinches if another is praised in her presence, and whose ego is an all-devouring possession, a veritable demon of unrest and self-seeking. She is never nobly generous in appreciation; never at peace, except on the crest of a compliment. Adulation is her native air, and she asphyxiates without it. She makes an exacting friend, a tyrannical mother, a jealous wife and a mischief-making mother-in-law. In *Tante* she is drawn with finished art.

Literary Notes

....*The Boy Fancier*, as its subtitle says, is a "complete manual of all matters appertaining to domestic pets." As necessary to a country boy as a cook book is to his mother. (Dutton; \$2.)

....From E. P. Dutton & Co. we receive a charming variety of Easter cards. The sentiments which these express are in some cases borrowed from so excellent a writer as Thomas-à-Kempis and the choice is wide enough to satisfy all tastes.

....Our Puritan ancestors in New England, besides subduing the country and establishing our institutions, invented a distinctive cuisine. Helen S. Wright in *The New England Cook Book* (Duffield; \$1.50) has collected a large number of recipes characteristic of New England, some of them copied from manuscript cook books more than a hundred years old. There is an astonishing variety and suggested toothsome-ness in these old time recipes.

....A new Supplement (the second) to the monumental *Dictionary of National Biography* is announced for publication this spring by Messrs. Smith & Elder, and, in this country, the Macmillan Co. The first Supplement, issued eleven years ago, completed the record as far as the death of Queen Victoria. The new Supplement includes memoirs of persons

who died between that date and the end of 1911. The editor, Sir Sidney Lee, has had the collaboration of nearly three hundred expert contributors. The re-issue of the *Dictionary* in a twenty-two volume edition (instead of sixty-six volumes) is also announced.

....Part Three of the Annual Report of the Secretary of Internal Affairs of Pennsylvania is the thirty-eighth report of the Bureau of Industrial Statistics (1910), published at Harrisburg, 1911 (pages 477). Pages of especial interest at the moment discuss the problems of the coal fields, and summarize industrial accidents and fatalities. There is a certain irony in the fact that a section entitled "Pennsylvania's Great Wealth as shown by Personal Property Valuation" follows hard upon this last.

....Mr. Isaac N. Stevens's story, *An American Suffragette* (Rickey; \$1.20), has a meretricious interest from the fact that the heroine has been identified as Miss Inez Milholland, a young lady of New York, a Vassar graduate and a leader among the more militant of suffragists, but it is otherwise negligible. The author makes a curious mistake on page 31, in the assertion that Silvia Holland was "a graduate of the law school at Columbia." Women are not admitted to the College of Law at Columbia.

....A new volume in *The Musicians' Library* contains twenty-seven *Songs from the Operas for Baritone and Bass* (Ditson; paper \$1.50, cloth \$2.50) edited by H. E. Krehbiel. The songs are given in their original keys and arranged chronologically. They cover the whole period of opera writing from the time of Handel to the present, and represent various schools and developments in the art. Mr. Krehbiel's introductions are apt and suggestive and will prove valuable in helping the amateur to understand and interpret the music.

....During the last few months of Dr. Amory H. Bradford's long pastorate, when he felt physically unable to deliver the regular morning sermon, he prepared and printed, and frequently read from the pulpit, what he called a *Prelude*, in which he gave expression to his personal Christian experience and faith. These messages, written in the clear and simple language of the heart, are now gathered into a little volume, full of assurance, comfort and sympathy, entitled, *Preludes and Interludes* (Crowell; \$1).

....It is doubtful whether there was any real need for another book devoted to outlining the plots of popular operas, the number of such compilations already being legion, but J. Walker McSpadden's *Opera Synopses* (New York: T. Y. Crowell Co.; 75 cents) at least has the merits of brevity, of clearness, and of

cheapness. Among the sixty and odd operas whose "stories" he tells with exceptional conciseness and compression he includes not only last season's novelties in New York but even the Metropolitan's prize opera by American authors, "Mona."

....Gelett Burgess' new novel, *Find the Woman* (Bobbs-Merrill; \$1.25), is dedicated to Scheherezade and Baron Munchausen among others, and it is extravagant enough to justify the dedication. A series of wild adventures in the streets and houses of New York thru which the hero seeks the answer to the question propounded in the first sentence: "Who was Belle Charmion?" leads the reader a breathless chase and keeps him entertained in much the manner of the moving-picture play. There is the same swiftness of action and violence of transition from one scene to another. Much of the story is told by the device of a series of short tales related by the different members of the "Liars' Club," but all bearing upon the plot.

....While there are several books dealing with the instruments commonly used in the modern orchestra, so far as we are aware the first volume in English devoted exclusively to the very different set of instruments employed in the military band is Arthur A. Clappé's *The Wind-Band and Its Instruments: Their History, Construction, Acoustics, Technique and Construction* (Holt; \$1.50). The author has been a teacher of music at the Royal Military School of Music in England and also at the United States Military Academy at West Point, and his book is the result of many years' practical experience. It is a thoroly good and useful compendium of information about band instruments, treating each in detail both as to its individual utility and its value in combination with its fellows.

....One of the best of the monographs thus far issued in that excellent series of little books on big subjects, "The Home University Library"—best because most interesting and stimulating to further study—is J. L. Myres's *The Dawn of History* (New York: Holt; 50 cents), in which Oxford's Professor of Ancient History, by the application of "geographical criticism to history, historical criticism to geography, and biological to both," provides an illuminating sketch of the beginnings of those peoples whose doings have most affected the course of human history. It is a brilliant study in the evolution of earliest civilizations; is scholarly without being pedantic, taking account of the latest archeological discoveries in Egypt, Babylonia, Asia Minor, and the Eastern Mediterranean; is delightfully straightforward, clear and simple in style, and in its picture of life in "Minoan" Crete fairly rises to poetic beauty of diction.

Pebbles

AS POETS MIGHT HAVE VARIED IT.

Thema Missouri, Opus 23

Every time I come to town
The boys keep kickin' my dawg aroun';
Makes no difference if he is a houn'
They gotta quit kickin' my dawg aroun'.

Variation, after Tennyson.

Kick him no more—thy feet are iron heeled;
He strove against thy blow, but all in vain;
Leave him in peace upon the street called
Main;

No more, dear love—one touch and wrath will
yield—

Kick him no more!

After Thomas Dunn English.

Oh, don't you remember my houn' dawg, Ben
Bolt,

My houn' dawg whose hair was near-brown,
Who whined with delight when you gave him
a bone

And howled in his fear at your frown?
Down the old Main street in the village, Ben
Bolt,

In terror my houn' dawg has flown;
They have got to quit kickin' my houn' dawg
aroun'—

They must let my old houn' dawg alone.

After Whitman.

I celebrate my dog, and sing my dog,
And him I shall not kick, nor shall you kick,
For every dog belonging to me, as good be-
longs to you;

He loafes and invites your sole;
He sits and loafes at his ease, nor heeds
Your kick as you pass.

After Poe.

Helen, my hound dog has to me
A sweet Niewan bark—his snore
Floats gently o'er Missouri's lea,
And he, on whom I set such store,
Shall be kicked no more!

After Edwin Markham.

Bowed by the fleas of centuries, he stands
Upon his ear, and grovels on the ground,
The agony of ages in his face
And on his back the pests of all the world.
Who roused him, not to rapture but despair—
A thing that howleth, and that quickly lopes,
E'en tho half stunned by brother to the ox?
Who loosened, and let drive that awful kick?
Whose was the foot that landed on my dog?
Whose toe did what it dassn't do again?

After Bret Harte.

"I kicked your dawg," the stranger said.

Said the old man. "Say no more,
And darken not my Ozark home,
Lest I hurl you to the floor.

"What did my dawg, my noble dawg,

That you should plant your boot
Against his side and send him off,
You nasty old galoot?"

"I was goin' to say," the stranger said,

"I kicked your dawg's one gate
And busted it—and here's four bits;
Now let me go—I'm late!"

—*Denver Republican.*

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, \$3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

A Leading Issue

In their treatment of an issue which has had great weight with the American people for three years past, the Democrats of the House have again taken up the schedule of tariff duties on wool and woolen goods. Bills revising the steel, chemical and sugar schedules have been sent to the Senate, and now the House is about to pass the wool and woolens bill which, as modified by a compromise with the Senate Progressives, was vetoed last year by President Taft. At the same time, the Republicans in the House propose a bill (relating to the same schedule) by which the position heretofore held by them is virtually surrendered. This may be shown by a brief comparison. While the Democratic Underwood bill makes an average reduction of 50 per cent., the Republican bill cuts down the duties by an average of 40 per cent. And this Republican bill is offered, in behalf of himself and his party associates, by Mr. Payne, formerly chairman of the Ways and Means Committee, whose name (with that of Senator Aldrich) is commonly attached to the title of the present tariff law.

Thus it is admitted by the Republican party in Congress that a reduction averaging 40 per cent. can be ordered in the wool and woolens schedule of the Payne-Aldrich tariff of 1909 without making the protection less than the difference between cost of production here and cost of production abroad. It is unfortunate for the party that this was not known by its leaders three years ago. They now have, it is true, a report as to these costs from the Tariff Board. They assert that the report warrants the reductions they propose. On the other hand, the Democrats say that the same report warrants their somewhat larger reduction. As the board found varying costs both in this country and in other lands, it may be impossible to measure the difference exactly, but it is clear that 40 per cent. can safely be cut off now, and could have been taken away in 1909. Why were the Republican leaders unable then to see that this could be done with due regard to the requirements of the protective policy? At least a considerable part of an excess so great could have been ascertained without the aid of a board of experts. The reduction proposed now simply emphasizes the blunders of that sham revision.

It is said that Mr. Taft will be embarrassed, in a political sense, if Congress shall lay before him now a revision of Schedule K substantially in accord with the revision which he vetoed last year, because the report of his own board will show that he was misled then and that now his signature should be attached. Probably a bill almost identical with the one he rejected will be sent to him in the near future. We expect that he will sign it, if he is convinced that it is warranted by the board's report. Embarrassment, if there shall be any, will be relieved in part by his criticism of this schedule in the past. He has repeatedly said that the duties in it were too high. We are confident that he will meet the requirements of the situation frankly and will act justly.

With respect to this schedule a board report has been completed and sent to Congress, but there is no report as to the duties of the steel, chemical and sugar schedules. It is asserted that for this

reason he will veto any one of the three bills, revising these schedules, that may be sent to him. This assertion may misrepresent his purpose. It seems to us that his action should not be determined wholly by the lack or by the presence of a board report. The requirements of the protective policy, as defined in his party's platform, permit reductions in the iron and steel schedule. There is proof of this in the export trade. There is nothing to be gained by refusing now to correct the blunders and wrongs of the revision of 1909.

The sugar bill, however, should not be classed with the others just mentioned, but must be considered by itself. By placing sugar on the free list, it surrenders \$52,000,000 of annual revenue and entirely withdraws the protection now granted. Coupled with it is a bill for a disguised income tax, which would yield, the authors of the measure say, about \$50,000,000 a year. The sugar bill was passed in the House by a vote of 198 to 103. In the affirmative were 24 Republicans, and on the other side were 7 Democrats (from Colorado and Louisiana), representing the domestic beet and cane sugar industries. All of the Democrats and two-thirds (80) of the Republicans voted for the excise or income tax bill, making a total of 250, against whom were only 40 in the negative.

Ought protection to be withdrawn from the production of raw sugar? Or ought the revenue yielded by existing duties to be given up? At the present time we admit raw sugar from Porto Rico, Hawaii and the Philippines free of duty, thus discriminating in favor of these non-contiguous possessions and against the sugar of foreign lands. Removal of the duty would have an unfavorable effect upon the sugar industry in these islands. Porto Rico's House has already forwarded a protest. Again, in return for a preference of 20 per cent. given to the sugar of Cuba, that island grants to the United States preferences which have promoted and enlarged our export trade with the Cuban people. If the sugar preference should be withdrawn (as it would be if all incoming sugar should be free of duty), our recip-

rocal commercial treaty with Cuba would fall. Protection (which yields \$52,000,000 of revenue) has established in our own country the beet sugar industry, in which, it is estimated, \$100,000,000 is invested, and which, prominent producers say, would die if the duty should be repealed. There are seventy-three beet sugar factories, in sixteen States. By the protection of the duty the cane sugar industry in Louisiana and Texas has been maintained. With the duty repealed, this industry would languish. On the other hand, repeal of the duty would reduce, it is claimed, the cost of sugar to consumers by about \$100,000,000 a year.

If the accompanying income tax should be found to be unconstitutional, the loss of sugar revenue would be felt, especially if our pension expenditures should be increased by \$75,000,000, as proposed in the Sherwood bill. As for the excise or income tax bill which was passed by so large a majority, and which has some defects, we should prefer the kind of income tax which Congress would be free to impose under the constitutional amendment which thirty States have approved. Many expect that the additional States needed will express their approval within a year or two. Several Senators, we understand, who want an income tax, think that Congress should wait for adoption of the pending amendment.

It must be admitted, we think, that there is shrewd politics in the Democratic program which relates to the tariff and the cost of living, and that, in view of the 1909 revision, which displaced in the House a Republican majority of more than 40 by a Democratic majority of 66, it is put forward to the disadvantage of the party in power. To the masses it appeals with much force. It exhibits the Democratic policy and purpose. It confirms popular condemnation of the sham revision. It is concerned with what we must regard as a national issue that is dominant in the minds of a majority. Mr. Roosevelt says the great issue now before his party and the country is: "Are the American people fit to govern themselves?" We do not think this is an issue. But the issue to which

the Democratic legislative program relates is one as to which his attitude has not been defined, one with respect to which his position is not known, one that may make Republican presidential primaries, soapbox or otherwise, futile.

Criticism of Courts

WE ventured last week to criticize the decision of the Supreme Court of the United States on a patent case, which allowed the manufacturer of a patented copying machine to require that those who bought it should use only the ink and paper which he sold. Our daring to risk contempt of court is accounted for by the stronger language of Chief Justice White in the dissenting opinion. We now have occasion to record the equally heedless attack on the decisions of our highest courts by Mayor Gaynor, himself of judicial antecedents. In an address last week before the new society to promote efficiency he said that "the judiciary of this country is the worst department we have"—he meant in efficiency, not in honesty. But here he said little more than President Taft has said more than once in his denunciations of the delays and expense of justice. The delays are a grievance, says the Mayor, and the appeals for the most trivial reasons are worse, and "the technicalities of the criminal courts are appalling." He says:

"American judges of the higher courts will now reverse a decision on a technicality of the law even if they think and confess that it is trivial."

Judge Gaynor even went so far as to instance cases in which decisions have been made that were quite technical and indefensible. There was the case when the Legislature passed a law to forbid children to be overworked in tenements making cigars, and the New York Court of Appeals declared it unconstitutional because it interfered with the "liberty" of tenement dwellers. The same court declared a law unconstitutional which regulated hours and conditions of labor in bakeries, because it interfered with this same "liberty." It interfered with the employees' "property right" to sell their labor. And the same court decided

that a law was unconstitutional which made employers liable for all injuries to employees at work because it "took away liberty without due process of law."

In the House of Representatives the other day, when the income bill, called a corporation bill, was up for discussion, Mr. Underwood, Democratic leader, and other speakers, attacked the decision of the Supreme Court that the previous income tax bill was unconstitutional. Said Mr. Underwood:

"When the Government had the right to tax wealth, we did not hear the socialistic cry of those less able to bear the burden of taxation. The spirit of unrest came when the Supreme Court abandoned its policy of a hundred years, and five justices to four said in effect to Congress that great wealth was to be exempted from taxation."

And after him Congressman Littleton, of New York, spoke in the same strain of criticism:

"I do not want to be understood as railing at the judiciary. I do, however, want to be understood as criticising the Supreme Court's decision of 1895 on the Income Tax law, which cut off at one stroke three-fourths of the taxing power of the Government."

Far be it from us to abuse our courts. We must have some deciding authority as to constitutionality, so long as we live under constitutions. But constitutions can be changed, and at times should be. There is an amendment now before the State legislatures which will allow the taxation of incomes by Congress as well as by States. The narrowest of margins by which the income tax law was annulled by the Supreme Court suggests that with its new membership the Court might reverse its very doubtful decision. At any rate, the fact that this new income bill past the House by the unanimous vote of the Democrats and by a two-thirds vote of the Republicans, proves that in some way the people are determined to get the authority directly to tax wealth denied to them by the Supreme Court. A more liberal interpretation by that court is the usual way of fitting legislation to the conditions of life at the present day. This is not straining or flouting the Constitution, but treating it as a human document, not as an iron fetter. That a more liberal interpretation is possible is shown in these cases in which the court was so nearly evenly divided.

Mr. Orton's Complaint

WE published in our issue of October 12, 1911, an article by Jesse F. Orton, Esq., criticizing the decision of the United States Supreme Court and a subordinate court on the right of a gas company to earn dividends on franchise values. We publish this week a second article by him on the principles involved as affecting the rates charged and the profits allowed by the courts.

In the first article Mr. Orton challenged the right of such a company holding a monopoly under a franchise to put any value on its franchise as a part of its assets. We are not disposed particularly to quarrel with him on this matter, altho it is far from clear that he had any right to blame a judge in an inferior court for feeling bound to accept the decision of the highest court that such franchise is property on which income can be received and dividends paid. This second article attacks both the company and the courts on two other points, and on neither can we agree with him.

His first contention is this: that because the company is operating under a franchise within the streets of the city, therefore it has no right to count within its dividend-earning property the present increment of value on the real estate which it purchased many years ago. Here we hold Mr. Orton to be in error. The real estate it has purchased and paid for it holds, just like any other purchaser, entirely apart from its franchise. If it increases in value and costs heavier taxes, that value must be counted in the business done. The franchise has nothing to do with it. In this case the land used for gas works, terminals and office sites cost many years ago some five million dollars, and is now worth some eight millions more. Mr. Orton would not have this increment appraised as value because certain other land, such as streets for pipe lines, is used under franchise. We fail to see how the holding of franchise as to streets affects right to appraise increment of values in land bought and paid for. Mr. Orton further says that this increment of value has not been created by the gas company, but by the increase of population. But the

company represents its part of the population, and so its part of the total increment of land value for the whole city; and its service has presumably given its share to create increased value.

The question is whether "the ordinary returns of business" cover the right to earn interest on the *increased value* of its plant; and whether, when that plant becomes worth more than it originally cost, such ordinary business does earn interest in that increased value. We do not doubt it does. If a merchant's land and buildings cost him originally \$100,000 and are now worth \$200,000, good business requires him to earn interest on that extra value. There is no question of this. And the fact that one is a "private enterprise" and the other a "public utility" has nothing to do with such property as is privately held and not given by franchise. The street franchise has no concern with property acquired by purchase, just as the merchant bought his.

Mr. Orton's other contention is as to the valuation of the franchise in the streets, and here also we fail to see that he is wiser than the courts. It seems absurd to Mr. Orton that the present value of the pipes under the streets should be measured by what it would now cost to put them down, rather than by what they did cost when the streets were unpaved and labor was cheaper. But the argument as to the present value of pipes under pavements is quite parallel to that of present value of land. The original cost, or the present cost to replace them, is no part of the franchise from the city, and was paid for in cash. The city did not put them down, but gave the right to put them down. The city did not pay for putting them down; the company did, and that is its property value. The value of the franchise is a different thing, and much may be said as to the valuation of the franchise pure and simple; and the franchise had its own separate value, and might have been sold, before a single pipe had been laid.

It is fair to add that Mr. Orton's representation that it is the pavements paid for by the city which give occasion for valuing on the reproduction rather than the original cost of laying pipes, is far from the fact. One would suppose from

this article that gas pipes were originally laid in open fields, with no other expense than digging in the soft earth. Nothing could be further from the truth. The major portion of the reproductive cost has grown not out of the paving, but out of conditions caused by the necessities of traffic and the increased cost of labor. To represent that the city by laying down pavements has, at its own expense, given to the gas company this reproductive value is not the fact, except to a comparatively insignificant degree.

As to the franchise itself, the courts have consistently and always given that a money value. Whether they should is something which one may properly question, altho the presumption is that they are right. But an inferior court is bound by the decision of the superior. It cannot put the superior court on trial. But this is to be remembered, that the United States Supreme Court, in very important cases, has lately refused to interfere to annul State legislation restricting rates. In 1909 it refused to declare such a rate confiscatory; in the Consolidated Gas case Judge Peckham gave a similar decision, to the effect that a court must wait until the company has tried the rate imposed by law and proved it confiscatory. These decisions are universally interpreted to mean that no company can hope to prevent reduction by law of its rates before it has first tried the reduced rates and proved them confiscatory. Here the Supreme Court is right and has proved itself the bulwark of the people.

Religious Education

THE public school cannot teach religion; the Church can. When our people were all of one religion we could allow the State to teach religion and to support it, but that is long past. Our public schools used to open with reading the Bible and prayer, and every one approved; but that was so bitterly attacked by Archbishop Hughes and others that it had to be stopt. The practise is still kept up in communities of a single faith where the State law does not forbid. Those who used to condemn the public school as sectarian now condemn it as godless. It is hard to suit some people.

It is no more godless than a factory, or a political meeting, or a picnic, or a lyceum. What makes a company godly is to have godly people in it. We call ours a Christian nation because most of our people are Christians. Only in this way is our nation more Christian than it is Jewish or Moslem or Buddhist. To teach in a public school Jewish children to sing Christmas hymns at the holiday season, as has been done in this city, is an utter wrong.

But religion should be taught to all children. It cannot be taught by the State with public money; that is clear. It can be taught by the churches, and, better still, by the parents. To be sure not all parents will teach their children; or can teach them properly. So the churches undertake to supplement their lack, and try to give better and more generally universal teaching. They try to take in those whose parents neglect this duty. Even so some will be overlooked, but nearly all will get a certain amount of religious teaching, and if the churches did their full duty none would be overlooked.

But what is it to teach religion? It is not to teach prayers; that is good. It is not to teach the Commandments or a catechism, tho these are good; nor is it anything else *about* religion, its forms or its formulas. Religion, so far as it is essential, under whatever form of faith, Christian, Jewish or Mohammedan, is love, honor, worship and obedience toward God, and controlling love and service for one's fellowmen. This is what is to be imprest and enforced first, last and all the time. This is what makes character, and only this. Reading and studying the Bible, committing to memory the Commandments, repeating of prayers, have incidental benefits, but they are not the thing itself; they are not religion. Religion is wholly of the heart, not of the hands or the lips. The teacher who goes thru a lesson and teaches this only fails lamentably in teaching religion.

Here is where our religious teaching is generally weak. Time is take up with lessons, lessons; with explanation of passages, with memory exercises, with the same kind of teaching as in the public schools, instructive, informational, in-

tellektual, but not reaching the heart. The wise teacher, but particularly the father or mother, in teaching the child to pray, should remember the first duty to seek the full commitment and consecration of the life of the child to that life which Moses taught and Jesus taught and lived. The child should be taught that Jesus died, but even more earnestly taught to follow the life of Jesus. If the teacher or parent misses this his teaching is vain.

We do not, any of us, Protestants, Catholics or Jews, give time and thought enough to the religious education of our children. We teach their heads when we should teach their hearts. When we have taken their religious education out of the public school we should all the more remember that God has made it the duty of the home and the Church. Catholic parochial schools are as much at fault as Protestant Sunday schools, and parents are even more at fault, if they think they can be discharged of their duty by the Sunday school or the parochial school. Fortunately, thru Christian teachers, the unconscious influence of the public school will be religious even on those whom religion meets in no other way. But if religious parents do their duty, and the Church does its duty, such untaught children will be very few. These the Church must seek and bring in from the highways and hedges.

The Country-Home Movement

It probably does more harm than good to stimulate the movement countryward with a lot of figures, showing the very large profits that are sometimes reaped in a very short time. When it comes to the ravishing stories from Florida and Colorado and California, where every one gets rich by simply buying waste land or swamp land, which somebody promises to work for nothing, it would seem that the reader would comprehend the fraud at a glance. Unfortunately thousands do not, and it is found possible to enrich land speculators at the cost of the very small bank accounts of washerwomen and day laborers of all sorts. A few of these projected cities in the mountains and ever-

glades are honest efforts to improve the land; most of them are not.

This is not the worst of the story. Thousands more are misled by the truth, the truth out of place in proportion. Our own Long Island reports between three and four hundred bushels of potatoes to an acre; at seventy-five cents per bushel. But the other side of the story is that such a yield can only be expected under the most intensive method of culture, at considerable cost of labor and fertilizer, and that it can be expected by only a very few of those who go out from our cities to till the land. Still more important is it that these people shall be told that when prices are high potatoes are scarce, and when potatoes are plenty the prices may fall off in proportion. That is the trouble just now, that the potato crop is so small that the farmer will hardly get compensation for his seed, fertilizer, spraying, planting and digging. Certainly those farmers who have not taken peculiarly good care of their potato fields this year will be out of pocket.

For several years extravagant tales came from the celery fields of Florida, and the misfortune was not that they were false, but that they were true; so true that buyers of celery lands could easily afford to pay one thousand dollars an acre; some paid more. But in 1910 the thing was overdone, and the markets were flat, and the growers had nothing else to do but to turn their celery under as fertilizer.

There surely are two sides to this country-home question, and altho THE INDEPENDENT is emphatically in favor of country life, it believes that we should be honest with those who inquire and that both sides of the story should be told. In the long run, figures show what the experience of skilled workers also shows, that horticulture pays. Any one with health and sound judgment can at least make a living in the country, and can do it off a very few acres. We are slowly learning how not to waste, and how to apply every bit of energy to production. Intensive farming rarely fails of making an industrious family at least independent. Around all our large cities the market-gardeners and truckers are easily found who are

worth from ten thousand dollars up to seventy or eighty thousand.

Those who live farther back from market are more liable to be the victims of middlemen, but the trolley and the telephone are coming to their aid, and the automobile is learning how to run to market thirty or forty miles in the morning. We believe the chances have been a good deal more than doubled within the last ten years for even an untrained person to make a fair living in the country as compared with the city. With the present opportunity for agricultural training in our schools it will soon be possible for any one to quit his town life and safely venture into agriculture.

But already in what we have said we have allowed a proviso for health, another proviso for training, another proviso for knack and skill, and still another for good years and favorable weather. So we shall have to allow that the man or the woman who lives in a city, without training that applies to land culture, without taste for country living, without that something which we call knack, and then again without a little capital to start with, must be helped over the ridge or they had better stay in the city. They will at least go home with a week's wages in their pockets, even if they die without ever seeing a bank deposit.

This dilemma, however, need not for the present disturb us. Governor Hadley, of Missouri, is only one of half a dozen who are authorized by their States to extend aid to genuine country-home seekers. It has become public policy to help break up the crowd and put the land under tillage. Meanwhile our agricultural colleges have moved steadily toward a method of education specially arranged to prepare such home-seekers with necessary information. Our experiment stations, supplemented by model farms conducted by our railroads, are working in the same direction. It is now proposed by some of our Western cities to establish schools for the distinct purpose of fitting the masses to disintegrate safely and rely upon individual initiative.

It seems likely also that a good deal more of our social energy will be spent

from this time forth on suburbanizing the crowd. Cities of all sizes and everywhere have been spreading out to take in surrounding districts, and this has proved to be a wholesome relief. For several years back this has been the drift, and it explains the apparent reaction from country home-making. The suburbs are counted into the cities and not into the country. As the old-time farming is going, so the old-time herding is passing away. The city, with its camel-track streets, its ill odors and its disease-breeding tenements are not essential parts of the modern idea of the city. The future city and the future country are likely to blend into each other, leaving a very large district that can neither be called one or the other. The auto suggests it; the ease of reaching market urges it, and civic ambition fosters it.

Still more are we to take into account the recent growth of home industries. This is a novel and unexpected reaction from the tense factory life that has controlled us for about seventy-five years. The farmer is getting to be also a manufacturer, as he was in the earlier days of American life. The factory became a necessity simply because it could command power—that is, steam power. Otherwise the cost of producing food articles and a good deal else in the home is less than it is in the factory. The farmer today is learning how to harness the little brook that runs thru his garden and compel it to do his barn work and his house work, to grind his waste products, to can his superfluous fruits and vegetables, to churn his cream, and to turn the lathe in his repair shop. Or he may have a gasoline engine at small cost hitched to his driven well, and performing the work of half a dozen hired men and women. At the same time this new power can drive a dynamo to light his cottage with electricity.

This new era opens socially as well as individually, and manufacturing is becoming a co-operative venture. Among notable instances is that at Asheville, N. C., where the log cabins manufacture rugs, furniture, harnesses, and much more. Canning waste garden products, the using of second-class apples for cider, such methods of adding

to the farmer's income, do not call, by any means, as they once did, for community canneries and cider mills; home outfits are growing common. Those who undertake to study the country-home movement cannot do it safely from the old standpoint; they must understand the new currents that are set in to affect the methods of country life.

✱

Our June Vacation Number

Since we announced our plans for this year's Vacation Number we have received a great many articles of the desired length (not over 800 words, 400 preferred) and a large number of photographs. Before April 10, however, that being the final date for the consideration of manuscripts and pictures, we hope to receive still more of both. It is needless to repeat the suggestions which we made in our issues of January 18 and February 15; where we announced, also, the first prize of \$15, the second prize of \$10, and the other prizes offered. As we stated, we want this Vacation Number (which will be dated June 6) to include as many fine water pictures as possible. Let us quote our earlier invitation:

For 1912 we desire water pictures. We do not say "marines," for inland waters will furnish innumerable subjects. . . . And any picture that has water in it—even a bath-tub scene or a water-wagon or an impression of Broadway on a rainy evening—will stand its chance of selection.

The "Vacation Letters," however—and these are a traditional part of our Vacation Numbers—should not be predominantly watered stock. The only essential is that they be not dry. With our readers' help we shall make this the best and most diverting issue that we ever published in the month of June.

✱

Philippine Independence

It is curious to observe how anxious some people are to get rid of the burden of responsibility and help for the people of the Philippine Islands. A Democratic Congressman has presented a bill, which some people think is likely to pass the lower House, to give the people of those islands entire independence nineteen years hence, with a previous interval of preparatory training. We have supposed that they were having a pretty

considerable training in self-government as it is, with their local self-government under their elected mayors, and so large a body of elected members in their general government. We may be pretty sure that the people of the United States do not wish to rule them beyond what they can rule themselves. Every other nation that has colonies thinks we have gone quite too far in trusting the people for self-rule, but we are anxious to go further. Yet just now we see what condition Cuba and Mexico are in; how we delivered Cuba and past over the government to her, and how we then had to send our army back to keep the peace, and have to keep warning Cuba that she must not compel us to go again; how anxious we are lest we be compelled to stop the fighting in Mexico; and this makes us anxious whether we could safely turn over the Philippines to a people so large a portion of whom are yet savages, and among whom there are sure to be rival ambitions if they are let alone. The bill before Congress kindly provides a constitution for the proposed Philippine Republic, but we cannot believe that our people will be willing in such an ungenerous and cold-hearted way to lay down the benevolent responsibility which we have assumed.

✱

Citizenship for Porto Ricans

It is a rosy report of conditions in Porto Rico which Mr. F. V. Brown, the Attorney-General of the island, brings back after two years of service in his office, which has brought him into close relations with the people. He declares that there is no anti-American sentiment, and no occasion for criticism of the courts there such as Mayor Gaynor has exprest about the courts here. But there is one complaint that is serious, namely, that Congress has not yet given citizenship to its people. Both President Roosevelt and President Taft have urged it upon Congress. A bill to that effect has past the lower House of Congress and is awaiting action in the deliberate Senate. The other day, says Mr. Brown, a rich Porto Rican bought a piece of property in this State, but found he could not get a title to it, as the law of New York forbids aliens to hold real estate, and he was considered

an alien. That is very unjust considering that, as a Porto Rican, his whole political and economic life belongs to the United States, that he is under the protection of the American flag, and that the people of Porto Rico are as loyal to the country as is any State in the Union. We might well learn something from Porto Rico as to the expeditious trial of cases at law. There no new trial can be allowed on a mere technicality, but only if some substantial error appears in the record. As in the English system, the judge is allowed to comment on the evidence and sum up the case; and perjury in court is made contempt of court.

The Right of Precedence

Probably to no other ecclesiastic in the country, unless he were a Cardinal—and we trust to no other Cardinal—would it have occurred to demand as his right that at a public meeting he should take precedence of the Governor of the State, as did Cardinal O'Connell, of Boston, at the meeting of the Irish Charitable Society. The first toast was to the United States, and an address was made by the President. It was then arranged, so it is said, to give the second toast to the Commonwealth, and Governor Foss was to be present and respond; but the Cardinal demanded that he, as a Prince of the Church, should have the seat at the right of the chairman and should speak before the Governor. When this was told to Governor Foss he refused to attend. We can imagine that as this was a Catholic society the Cardinal claimed precedence over the Governor, but in this country he is no "Prince," but a plain American citizen, and one bound by the law of Christ to obey the command of our Lord to Peter and the other Disciples not to seek the highest seats. Cardinal O'Connell has learned too much from the ceremonious Court of the Vatican; and he is ruling his diocese with unusual rigor, and attempting to rule the rest of the country, we should judge from his late severe condemnation of unnamed Catholic journals. He could not have had in mind the three of his diocese, for if the two that are not owned by him are not particularly fulsome they are at least loyal and docile. He must have had in mind others

as far off as Milwaukee and St. Louis. With all its ceremony there is a worthy democracy in the Vatican, for Pius X is the son of a workingman, while Cardinal Gotti, head of the Propaganda, is the son of a dock laborer. The Catholic Church may be called theocratic, with a democratic disregard of rank. The priest may come from the humblest grade of society, and then become Cardinal or Pope; but never a Prince.

Free Churches In the Reform Jewish temples as a usual thing only men are counted as voting members, and none are admitted as members who cannot pay \$1.50 a month. We do not wonder that at the last convention of rabbis this was a leading topic of discussion. This is a reform quite as important as any other. The practice makes the temple a home for rich people. A clerk working at \$10 or \$12 a week, with a little family depending on him, cannot afford, or will think he cannot afford, to pay so much, and he will stay away. He does not want to be an object of charity in his religion. The same evil is being made a serious concern in Catholic churches since the Papal Delegate forbade the custom to continue in America of requiring the payment at the door of ten cents of those who come to mass. But the new rule is not obeyed. Priests and bishops fear that the removal of the money tables from the door of the church will in many cases leave it without support, and the new Papal Delegate may need to take drastic action even as to bishops. The evil in some Protestant churches takes the form of a tax on pews. No one can have the right in a pew who does not pay so much regularly. Those who do not feel able to pay, and who cannot afford good Sunday clothes, stay away from church, and the churches ask why their seats are empty.

Chinese Suffragets It is an amusing story which comes to us from Nanking, and a sad story also, that women, more successful than those in London, have stormed the new Chinese Parliament, taken possession of it and driven out the members, in protest against the restric-

tions of the law enfranchising them. The Assembly had the day before past a law giving the ballot to women who could pass an educational test. But that did not satisfy the women, many of whom cannot read that intolerable system of writing, and they showed their indignation by forcibly seizing the chamber. Let it be remembered that thousands of women have served in the revolutionary army, and they think they have gained some political rights thereby. We must also believe that with the multitude of new newspapers in China they have learned what their English sisters are doing, and the Western way appealed to them. Is it not amazing how swiftly an idea runs around the world, and with what quick avidity a people long belated grasps the principles of liberty and reform? China will apparently have female suffrage before New York or Massachusetts. The binding of women's feet to keep them at home will cease, but we hope they will not give up their style of dress and assume corsets. Perhaps they may discard their long hair, as the men have discarded their queues; and our own women might, despite St. Paul, do the same with a great accession of comfort and leisure.

A Moral Code for Japan We do not discover that the proposal of the Japanese Minister of Education, to call a conference of Buddhists, Shintoists and Christians, has any suspicious purpose or could have any harmful result. Apart from its announced purpose, it will make a certain difference in that Christianity will be recognized officially as a Japanese religion. Hitherto Shintoism and Buddhism have had such recognition, but not Christianity. But since 1667 no obligations or privileges have been attached to this recognition, beyond the matter of prestige, which counts for much in Japan. No other advantage or damage accrues or would accrue if Christianity also had this empty privilege. What the Department of Education is concerned with is that the effort to teach morals apart from religion has failed, and the two old religions and the new are asked to report how far they can agree to teach morals under the binding authority

of religion. Every religion must teach morals, and altho morals may be taught apart from religion, the aid of religion is of the greatest value, and Japan seeks it.

The Russian Church in America

We pay very little attention to the Holy Orthodox Eastern Catholic Church in America, and hardly know there is such a Church, and yet, in its various branches, it counts over 400,000 adherents, of whom 100,000 are Servians, 75,000 Greeks and nearly 250,000 Russians and other Slavonic peoples. No other religious body holds more tenaciously to its customs, rituals and doctrines than does this Eastern Church, which boasts its immediate descent from the Apostles. But it has no influence in this country, and that because it remains foreign and uses only the languages of its immigrant members. This is an English-speaking country, and can never be Russianized or Grecized. French, German, Spanish and Welsh people learn the English language and establish English-speaking churches for their children. But the prelates of the Eastern Church are very unwilling to follow this wise example. It is growing by the thousands in this country and in Canada by immigration, and the children are already talking English; but there is no provision in any cathedral or parish church to have the liturgy said in English, or the Gospel or Church doctrines preached and expounded in the language of the land, which is all the youths know. Only on great holidays do they go to their parents' church, for they say they cannot understand what is read and said. The children go to the public schools and talk English, but the priests still teach the catechism only in Russian. The prelates seem to be Orthodox overmuch. They talk only Russian, and are sent here for but eight or ten years, and then go back to be pensioned off in Russia. The Catholic Church is wiser in her methods. She does not try to Italianize America, but to Catholicize it. The Holy Orthodox Church holds that the Roman Church errs in that it uses Latin in its mass; yet she seems never to think of using English in her services

when her children are deserting her from lack of it. Thus the Roman Church grows, but the Russian Church can only die.

The women in some of the larger towns up the Hudson River controlled the elections last week, under a program reached after a careful investigation by the Municipal Research Bureau. It required that all estimates for expenditures be made in advance on a fixed plan clearly shown to the taxpayers, and with public hearings on all proposals to spend money; that all bills be paid annually, and none run over to "make a showing"; that all contracts be drawn so clearly that anybody can understand them; that reports be published promptly and an information bureau established; and that conferences be called with neighboring towns to take up, including congestion and communicable diseases, with a view to having the decisions mandatory. It would be well for women in other towns to communicate with the Municipal Research Bureau and learn how they can clean up corrupt local politics.

The settlement of the Lawrence strike relieves a most dangerous situation as to which those at a distance have had little likelihood to get a safe conclusion owing to the absolutely different reports made by those who visited the strikers. But of the doings of some outside parties there can be no question. An insulting address was sent to the President of the United States from the headquarters of the Socialist party, from which we quote:

"In your capacity as official representative of the capitalist class of the United States, etc."

They proceed to "demand" once and again that he take the action they desire, and they require of him "an imperative message to the Mayor of Lawrence and the Governor of Massachusetts" that these "atrocities may cease." They understand neither courtesy nor the principles of our government.

In the noblest and most useless of all the physical sciences, that of astronomy, the United States leads the world. It is the one science in which our *savants*

have reason to be proud. In the useful sciences they have been too busy inventing and in applying discoveries of others to make very many of their own. The Harvard astronomers have completed their immense task of mapping the sky, and their photographs give a million and a half stars. The maps if put together would cover more than five acres. These photographs, taken at regular intervals, give opportunity to study the movements of the stars, the appearance of new stars, and the discovery of asteroids. These studies, with the spectroscopic observations, are beginning to give us light on the constitution of the universe.

We wish Congress would, by the enactment of a law like the Sulzer bill, make binding on the President what he is in the main doing of his own good will, namely, prohibit the question of politics in the appointment of consuls and diplomatic secretaries and other such employees abroad, and that they be appointed to grades instead of to specified posts, and be promoted according to efficiency, with examinations of candidates for such service. We should be thus relieved of some sad scandals, and business would be carried on more effectively. Conditions are now vastly better than they were twenty years ago and less, but there is still room for improvement, and for the relief of the appointing power from embarrassment and suspicion.

We have received several little pamphlets entitled "The Drift of the Times," severely attacking the Men and Religion Forward Movement, on the ground of its apostasy from the Gospel truth. They come from the Gospel Missionary Union of Kansas City. We learn from them that Phillips Brooks was a "Unitarian preacher"; that the leaders of the Young Men's Christian Association are no better; Professor Rauschenbusch is "antagonistic to the doctrines of redemption" and "a destructive critic"; that Professor Graham Taylor and other speakers are teaching false doctrine; and that the Forward Movement generally is conducted by foes of pure religion. The men of the Gospel Missionary Union are to be forgiven; they know not what they do.

Nothing can be plainer than the injustice which gives Florida one delegate to the Republican national convention for every 888 Republican voters, Louisiana one for every 448, South Carolina one for every 220, and Mississippi one for every 218; while in Colorado, Illinois, Indiana, Iowa, Michigan, Ohio and other States each delegate represents about 10,000 voters of the party. These rotten boros are easily manipulated or even bought, to the disgrace and real injury of all candidates concerned. We approve the plan rejected at the last convention, which gives four delegates to each State, and distributes the others on the ratio of the party vote cast at the last Presidential election.

It is hopeful to learn that Kentucky is finding out the reason why over 23,000 negroes have emigrated from the State during the past ten years. Knowing that this is a serious loss to the State, and discovering that a chief cause is the lack of educational facilities, Lexington, Ky., has just completed the finest public school for negroes in the South at a cost of \$80,000. It will provide for 450 pupils. This is better than lynching, a practice which negroes would seem to be unfortunately learning. A negro near Vidalia, Ga., was lately lynched by members of his own race for killing three men at a negro festival.

One of the Italian warships that without notice bombarded Beirut and killed a number of men was named "Garibaldi." In Trevelyan's "Garibaldi and the Making of Italy," pp. 294, 295, we read as follows:

"The power of this great national movement [the *risorgimento*] has fortunately been directed only to the securing of Italian liberty, and not to the oppression of others. No doubt the reason of this is the fortunate fact that no alien race dwells beside the Italian within the boundaries of the Peninsula. There is no one for the Italian to oppress . . . no one who can complain that he was enslaved in order that Italy might be free."

It is easy to discover another spirit in the sudden war against Turkey.

They used to call Archbishop Ireland the Consecrated Blizzard; but there is a more startling description given of

Father Bernard Vaughan, of England, now preaching in the various cities of this country. His oratory surprised an audience which heard him when once he preached before Pope Leo XIII in Rome. "He can't be an Englishman," said Cardinal Rampolla to the Pope. "No," said Leo with a smile. "Father Bernard was born in the crater of Vesuvius, and we only sent him to England to cool."

We trust that Congress will not fail to enact the bill recommended by the President in a special message and approved by the Federal Council of Churches and by many distinguished citizens of all political and religious faiths, calling for the appointment of a Federal commission on industrial relations, which shall study the causes of unrest and report to Congress within three years. The present unrest requires a thoro investigation of its causes.

It was a perfectly courteous and yet perfectly plain statement which Mr. Churchill made in the House of Commons, declaring that Great Britain would double all Germany's additions to the navy, but be glad to reduce in a corresponding way. Why will not Germany agree with England to cease this detestable rivalry? Germany announces enormous increases for the next eight years, and Great Britain will double them.

The desire for a reform of the spelling of English words is growing all over the world. We have received a request from a principal Anglo-American journal in China for a list of the simplified spellings adopted by THE INDEPENDENT, which it proposes to use.

Again the United States Supreme Court is filled, by the confirmation of Chancellor Pitney, of the Supreme Court of New Jersey. It is an appointment worthy of President Taft's great care.

The chief plank in the policy of the Progressives seems just now to be the recall of ex-Presidents.

The Independent

VOL. LXXII NEW YORK, THURSDAY, MARCH 21, 1912

No. 3303

Survey of the World

Strikes Tho Representative Lee, of Pennsylvania, has introduced an amendment to the Erdman act to compel arbitration, the probability of a cessation of work in the anthracite coal fields in Pennsylvania, beginning April 1, remains strong. This strike would affect 180,000 mine workers, and would follow the failure of the operators to accede to demands for greater wages, shorter hours, etc., and the expiration of the old agreement between the operators and miners. The operators say the increase in wages would cost them \$28,000,000 annually, and this, with the increase in the cost of mining anthracite coal, they cannot afford. The operators wish to continue the present agreement for three years more. John P. White, president of the United Mine Workers of America, who has, with fellow members of the union's conference committee, met the operators' committee at New York, says the membership of his organization is growing daily, and apparently the workers will not accept a compromise, even if it is offered.—The endorsement of the American Woolen Company's wage proposition by the Lawrence strikers on March 14 has been followed by a general return to the mills, tho not all the other mills have specified in detail the extent of their wage increase. On Saturday it was said that only 4,000 strikers were still out at Lawrence. The peace may prove to be only a truce. Meantime a strike on a smaller scale, but marked by riot, has taken place at Barre, Vt., another textile town. A second strike is on at Passaic, N. J. An advance in wages is expected at New Bedford, Ipswich and other New England

towns. At Fall River the textile operatives (who have not quit work) decline to accept a 5 per cent. increase, holding out for 15 per cent. Other announced increases were reported in last week's "Survey." Textile operators of Philadelphia will voluntarily increase wages 5 per cent., and reduce the hours of labor per week from fifty-eight to fifty-four, it is said; this would affect 100,000 workers. Some 175,000 workers in New England will, it is estimated, profit by increases.—Demurrers to indictments against forty-six defendants in the Government's prosecution of the alleged dynamiting conspiracy were filed at Indianapolis on March 12. Eight defendants were not present, most of them being under imprisonment or arrest. Judge Anderson, of the Federal Court, who is hearing the cases, ordered the thirty-two conspiracy indictments against the defendants consolidated into one.

✱

Mr. Roosevelt The Republican Split summoned last week, for conference at New York, his representatives in Chicago, St. Louis, Boston, etc., and it seems to have been arranged that he should speak in the near future at the cities named, at Minneapolis and elsewhere. He will have the ten votes of the Oklahoma delegation to the Chicago Convention. President Taft will doubtless receive the twenty-four Virginia votes, and on the 16th his managers were claiming 135 votes, against fifteen for Mr. Roosevelt and two for Senator Cummins. The Roosevelt campaigners rejoice over the vote of the Massachusetts legislature for a Presidential prefer-

ence primary election, to be held April 30. One of them, Governor Stubbs, of Kansas, appeals to Mr. Taft to call off his political managers in that State, who

"are using every means in their power to prevent Presidential primaries from being held."

The Kansas State Central Committee has decided against Presidential primaries and has endorsed the President. Representative Anthony, of Kansas, has telegraphed to the President his denial of Governor Stubbs's charge that Federal patronage is being used as a political weapon in that State, stating that the only officeholders guilty of pernicious political activity are the Governor's officials, who have been "waging war on the national Administration for many months." Similar charges and counter-charges are being made at New York, where the Taft workers charge that names have been forged on the Roosevelt election petitions, while Roosevelt workers allege that Taft men have boasted that they will carry a certain district "by fair means or foul." The Union League Clubs of New York and Philadelphia, have denounced the recall of judicial decisions and other Roosevelt policies, and the Philadelphia club has committed itself to the President's renomination. Charles Nagel, Secretary of Commerce and Labor, made a speech in Indianapolis, March 11, praising Mr. Taft's work as a progressive President and denouncing the attitude of critics who have not raised a hand "to help lift the burden which the party, by their consent and approval, had assumed," but have, instead, "filled the air with nostrums"—which he explained to be the initiative, referendum and various forms of recall. These might be adapted to State and local uses, but Mr. Nagel inquired:

"Is it seriously contended that the whole people of the United States shall initiate legislation?"

"Is it contended that after Congress has enacted a law that law shall be submitted to the whole people of the United States for ultimate decision?"

One of the Secretary's questions in regard to the workings of the recall of decisions was:

"If the people of one circuit have reversed the court of that jurisdiction is the rule to be

good for that circuit only, or is it to be accepted as a precedent for people of other circuits, who may disagree?"

—Mr. Roosevelt's and Senator La Follette's forces have fought hard for the North Dakota delegation, which was to be chosen this week. Senator LaFollette gave out, at Madison, Wis., on March 13, a campaign platform reiterating his belief in the policies for which he has stood, including "the adoption of graduated income and inheritance taxes, the parcels post, government ownership of express companies, and government operation at cost," etc. He would have a commission created to investigate illegal actions on the part of trusts and combinations, with power to evaluate their physical properties. He favors the creation of a properly empowered tariff commission. He opposes the Aldrich currency scheme. He favors government ownership and operation of the Alaskan railways and coal mines, and of an Alaskan steamship line by way of the Pacific ports and Panama to New York. He opposes reciprocity with Canada. Senator LaFollette points out that during Mr. Roosevelt's Presidencies the total stock and bond issues of combinations and trusts rose from \$3,784,000,000 to \$31,672,000,000—"more than 70 per cent. of which was water." An issue of veracity has been raised between Mr. Roosevelt and Walter L. Houser, manager of the LaFollette campaign, in regard to Mr. Roosevelt's part in the LaFollette candidacy.

The Democratic State Convention in Kansas has instructed its delegates to vote for Champ Clark, with Governor Wilson for second choice. Governor Wilson's friends claim 800 delegates for him and assert that he will be nominated on the first ballot taken at Baltimore.—Tho the free sugar bill was passed by the House of Representatives, on March 15, seven Democrats, representing sugar cane and beet sugar districts, opposed it. The final vote was 198 to 103, twenty-four Republicans voting for the bill.—The general debate on the excise tax bill, providing a 1 per cent. tax on incomes of corporations, firms and individuals exceeding \$5,000 a year, was

to be closed March 18, and a vote taken next day.—The nomination of Mahlon Pitney as Associate Justice of the Supreme Court of the United States was confirmed by the Senate, March 13. The vote was 50 to 26.—Dr. Harvey W. Wiley, Chief of the Bureau of Chemistry in the Department of Agriculture, resigned last week, and will, it is said, devote his time to editorial work and lecturing. Dr. Wiley is sixty-eight years of age, and has been in the Government service since 1883. He is eager to carry on the pure food propaganda from a base where he is entirely free, there having been friction within the Agriculture Department, where, in Dr. Wiley's words, the principles of the Pure Food law have one by one "been paralyzed and discredited." A housecleaning in the Department of Agriculture would not surprise close observers. Secretary Wilson has held his office for sixteen years, and of late his department has given the President more "cases" to explain than any other except the Department of the Interior under the Ballinger regime. Dr. Andrew F. Mitchell, of St. Paul, is Dr. Wiley's temporary successor. Dr. Wiley recommended for his place H. A. Barnard, Food and Health Commissioner of Indiana, it is said; but he is also reported to favor Dr. W. D. Bigelow, Assistant Chief of the Bureau of Chemistry. There are many other candidates.—The New Jersey Senate decided against the expulsion of Richard Fitzherbert, of Morris County, by a party vote taken on March 13. His fellow Democrats are said to be urging his voluntary resignation. Rumors of other legislative scandals in New Jersey are in circulation. Meanwhile an Ohio State Senator, L. R. Andrews, has been found guilty of bribery by a Columbus jury.—More than 8,000 names were struck from the books of the division registrars in Philadelphia last week, by order of the new Director of Public Safety. Many of these names were used by the politicians in the voting of repeaters. This is one of the reforms of Mayor Blankenburg's administration.—A gang of mountaineers and moonshiners entered the court house at Hillsville, Carroll County, Va., on March 14, and did not take their leave till they had shot and killed Circuit Judge Thornton L. Massie,

the commonwealth's attorney, and every officer of the court. They also wounded several jurors and spectators—some of them mortally. The crime was committed because a member of their gang had just been sentenced to a year's imprisonment. The murderers rode for the mountains when their work was done. Court was reopened next day, with a new judge, prosecuting attorney, etc., and indictments of six of the mountaineers were brought in. Four prisoners were promptly taken, and 500 detectives and deputy sheriffs pursued the fleeing mountaineers, who will defend themselves if overtaken in the Blue Ridge Mountains with courage and address. Governor Mann is considering the advisability of calling out the militia.—An electric bomb sent thru the mails to Judge Otto A. Rosalsky exploded in the hands of a New York fire inspector on March 16, severely injuring him and wrecking the library in the judge's apartment. It is this judge who, in 1907, sentenced De Foulke, alias Brandt, valet to Mortimer L. Schiff, to serve thirty years' imprisonment for burglary, and whose severe sentence has lately been the subject of a great deal of discussion. Brandt is now free on bail, and will be retried. Conspiracy had been charged, and it is supposed that the bomb was sent to Judge Rosalsky by some one who believes his sentence of Brandt in 1907 to have been manifestly unjust.

The hulk of the Burial of the "Maine" battleship "Maine,"

its deck covered with flowers, was towed out of Havana harbor on the 16th and buried where the sea is 3,600 feet deep. It had been escorted by two United States cruisers, Cuban gunboats and many steamships. These were grouped around the burial place when the valves in the wreck were opened. On the "Maine's" deck when she left the harbor was Capt. John O'Brien, her last pilot, formerly a well-known and daring commander of filibustering craft. There were salutes at the grave. The burial was marked by a dipping of flags in American ports and in many other parts of the world. Among the bells that were tolled was the one in Philadelphia's Independence Hall. The sea burial had been preceded by funeral

ceremonies over the remains of sixty-five of the "Maine's" sailors, lying in State in Havana's City Hall, surrounded by Cuban guards of honor. A funeral oration was delivered by Father John P. Chidwick, formerly the battleship's chaplain. The caskets were placed on the cruiser "North Carolina" to be carried to Washington.—The Cuban Veterans' Association asks Congress to inquire as to the sudden acquisition of wealth by President Gomez. He has been informed by our Government, it is reported, that it would be displeased if he should approve a pending bill granting a subsidy of \$1,800,000 for a railroad, to be built by persons said to be associated with him.

—General Acevedo, who attempted to start a rebellion in Cuba last summer, has been convicted and sent to prison for fourteen years.—Cuba's tobacco crop is the largest on record, and twice the size of last year's.—Porto Rico's House protests against the bill at Washington which removes the duty on raw sugar, saying the enactment of it would be ruinous in its effect upon the island's sugar industry.—In Hayti, Gen. Jules Coicou has been tried and condemned to death for his action in 1908, when he directed the execution of twenty-seven men, three of them being his brothers, whom he had betrayed and accused.

Mr. Knox's Tour Secretary Knox has been very cordially received in Central America. He did not go to the capital of Honduras, but was met at a seaport by members of the Cabinet and the Chief Justice, who made the two days' journey from the capital on mules. His visit in Salvador was very enjoyable. There and in Guatemala he was treated with as much honor as would have been given to a king. In Guatemala's capital arches had been erected in the streets, and he was welcomed by 6,000 school children bearing American and Guatemalan flags. The University of Guatemala conferred upon him the degree of Doctor of Laws. In his addresses he emphasized his country's support of the Monroe Doctrine and assured his hosts that there was no justification for such prejudice against the United States as might have been excited by the malicious reports of unscrupulous persons. He

will not visit Mexico or Colombia. In Venezuela a dispensation has been granted, permitting Catholics to attend banquets and to dance (in Lent) at balls given in his honor.—There are drastic provisions in the bill agreed upon by the House committee at Washington which authorizes the President to fix tolls on the Panama Canal within certain limits, the maximum being \$1.25 per ton. No discrimination in favor of American ships is permitted. All railroad companies engaged in interstate commerce are forbidden to own steamship lines on competing routes. This applies also to railroads which now own steamship lines in Northern waters.

The Situation in Mexico

There was some improvement in Mexico last week, due partly to President Taft's proclamation against the shipment of arms and to the support of Madero by prominent bankers. Mr. Taft was firm in his determination not to intervene, and was convinced that the shipment of arms to rebels should be prevented. At his suggestion a resolution authorizing him to forbid such shipment was introduced in Congress and quickly adopted without debate. Then, on the 14th, he issued a proclamation making shipments to Mexico unlawful, to be punished by a fine of \$10,000 and two years' imprisonment. It had been ascertained that rich Mexicans, led by General Terrazas, had deposited \$4,000,000 in bank at El Paso, and that Orozco was drawing upon this fund, hiring soldiers at prices heretofore unknown in Mexico. The proclamation had a good effect at the Mexican capital. Madero said it was the best proof of American friendship and worth regiments of soldiers. Our cavalry will patrol the boundary, and the coast may be patrolled by warships. Many volunteers joined the army. To the German colony at the capital 1,000 rifles were loaned, to be used in defense, if necessary. There was said to be a conspiracy to promote the secession and independence of six northern States, with ultimate annexation. Orozco's men captured Santa Rosalia and Jiminez, thus clearing his path to Torreon, but a large Federal force awaited him there. In a proclamation he promised to put to death

Madero and the latter's relatives, if they should be captured. General Pancho Villa's aid, Major Aldana, fell into his hands and was shot. It was reported that Villa himself had been taken and condemned to death, altho he asked for permission to join the rebel army. The exodus of Americans has not been checked. A decisive battle, it is expected, will be fought near Torreon.

South America Colombia's Chargé d'Affaires at Washington has been authorized by his Government to deny the report that it has been negotiating with Germany for the establishment of a German naval or coaling station at a Colombian port. He asks that the Panama controversy be submitted to arbitration.—Brief dispatches from Paraguay say that the revolution there is ended and peace has been restored.—It is expected that at the national election in Ecuador, Gen. Leonidas Plaza will be made President. Gen. Julio Andrade, who commanded the Government's army during the Alfaro revolution, attempted to obtain control of the Government by an attack upon the barracks at Quito, but was defeated and killed. The President of the Senate, Carlos Freile, was engaged in the conspiracy with him.—Argentina has decided to exclude a shipload of Hindoo immigrants now on their way to Buenos Ayres.—The newspapers complain of the growing power of what is called the American Meat Trust, and ask for an investigation by the Government.—Uruguay is preparing to make all banking operations in that country a state monopoly.—The new railroad across the Andes, from Arica in Chili to La Paz in Bolivia, has been completed. Parts of it are 14,000 feet above sea level.

British and German Coal Strikes The coal strike which closed the mines of Great Britain on the first of the month still continues, and hope of an agreement between the men and the mine owners has been abandoned. The first half of the third week of the strike was occupied with a series of conferences between the opposing parties and between each of them separately and the Cabinet ministers, but these were altogether fruitless.

Premier Asquith then announced that the Government, having done all in its power to secure an agreement and having come to the conclusion that this is impossible, would now take such other measures as it deemed to be necessary. The official statement goes on to say:

"The Prime Minister stated that the Government would ask from Parliament a legislative declaration that a reasonable minimum wage, accompanied by adequate safeguards for the protection of the employer, should be made a statutory term of the contract of employment of people engaged in underground coal mines.

"As regards the important question how such minimum wage may be ascertained for any particular area, the Prime Minister, without pledging the Government to any precise form of machinery, indicated that district minimum should be locally fixed by a joint board of each district, consisting of representatives of employers and employed with a neutral independent chairman, who might be selected by the parties themselves, or if necessary by the Government. Such a body would, in the opinion of the Government, afford what they have always regarded as all important—a means for securing an end to the controversy between the employers and employed.

"The proposals of the Government will include provisions to secure promptitude in the presentation of cases of the parties and adjudication of them."

It is expected that the minimum wage bill, when introduced into Parliament, will be rushed thru both houses, because, notwithstanding the revolutionary nature of the proposal, the seriousness of the crisis is generally recognized by the public, and the Government has been criticised on all sides for its inactivity. The officers of the Miners' Federation will not advise any resumption of work until a satisfactory measure has been enacted. The bill will not be acceptable to the employers unless it provides penalties for breaking the agreements by a strike and for failure to do satisfactory work. But the men are opposed to any form of compulsory arbitration, because they believe that the tribunals will inevitably be packed in the interests of the owners. If, on this account, the labor members vote against the bill, the Unionists will probably rally to the support of the Government. Besides the million miners and mine workers the number of men thrown out of employment in other industries is estimated to be from 600,000 to 960,000. The Great Western Railway Company has shut down its construction works at Swindon, which employ 10,000 mechanics. Most of the Sheffield works

have been closed. The Paisley thread mills, employing 12,000 operatives, have suspended. More trains have been taken off during the week, and locomotives are being fitted with burners for the use of petroleum. The strikers and the unemployed are showing remarkable self-control and disorders are rare and unimportant, the most serious being in the Earlstown district of Lancashire, where a mob of strikers seized the pithead and was with difficulty dispersed by the police.—In Germany, on the other hand, altho only about a fifth as many men are involved, there have been dangerous disturbances. About half of the 400,000 Westphalian coal miners went out at the call of the leaders; part of them, however, went back after six days in order to avoid the penalty of deducting six days' pay from their back wages. The demand for a 15 per cent. increase of pay was refused by the owners, who declare that it would be ruinous to grant it. Attacks upon the miners who remained at work were frequent and at Hamborn led to conflict with the police protecting them, in which several on both sides were injured. At Bochum police escorting a body of miners to their homes were met by a mob and fired upon from the windows. The police charged with drawn sabers and did considerable damage. Three deaths have occurred and the strike threatens to extend to Lorraine and Saxony.

Italian King Escapes Assassination

When King Victor Emmanuel was on his way to the Pantheon to attend a memorial mass in honor of the birthday of his father, King Humbert, who was killed by the anarchist Bresci in 1900, a similar attempt was made upon his own life. As his carriage passed by the Odescalchi Palace a young man who had just arrived on a bicycle elbowed his way thru the crowd on the sidewalk and drawing a huge revolver fired three shots at the King. The carriage, contrary to custom, had been closed at the request of Queen Helena, as she was not feeling well, so he missed his first shot, and the second was caught by Major Langa, commander of the King's escort, who spurred his horse forward to protect his sovereign. The bullet struck his helmet,

driving a piece of metal into his skull, and he received further injuries in falling from his horse, but he was not fatally wounded. The King, as soon as he had quieted the alarm of the Queen, who had thrown her arms about him to protect him, ordered the carriage to go on, and both King and Queen sat thru the ceremony in the Pantheon without betraying any emotion. On their return to the Quirinal the crowds which had gathered, on hearing of the attempted assassination, greeted them enthusiastically. Their assailant is a stone mason, twenty-one years old, named Antonio Dalba. He declares himself an individualist anarchist and glories in his deed, which he asserts was inspired by a vision. The assassination of Humbert was planned among the Italians of Paterson, N. J., but Dalba, who appears to be a weak-minded, unbalanced character, either made the attempt on his own initiative, as he claims, or at the instigation of local anarchists.—The long continuance of the war in Africa is draining the funds of the Government and exhausting the patience of the people, and there is a strong demand for putting an end to it by a bombardment of the coast cities of European Turkey. The negotiations of the Powers to conclude peace have apparently failed.—It is reported that in an engagement at Bengazi, Tripoli, on the 12th a thousand Turks and Arabs were killed and as many more wounded. The Italians carried the two oases where the enemy was intrenched with a loss upon the Italian side of three officers and twenty-five men killed and seven officers and fifty-five men wounded.

The Morocco Controversy

The negotiations between France and Spain in regard to their respective interests in Morocco seem to have come to a deadlock. Premier Poincaré had gone so far as to express to Señor Caballero, the Spanish Ambassador at Paris, his surprise at Spanish procrastination and obstinacy. In reply, the Spanish Ambassador is said to have called the attention of M. Poincaré to the fact that the French Government was unwilling to discuss the question until after the conclusion of the agreement with Germany, and that since then the conversations have been repeatedly

interrupted on the part of France, and further that so important and difficult a question as the establishment of suitable boundaries between the two zones cannot be settled within a few weeks. The territory claimed by Spain in the north of Morocco is regarded by France as excessive and unjustifiable. Spain refuses to have the proposed railroad from Tangier to Fez under a single management, preferring that each nation should construct and run that part of the road falling within its zone. The resistance offered by Spain to the French proposals is ascribed by some to the action of Great Britain in supporting Spanish claims. If the matter cannot be settled sooner, the French Government proposes without delay to put into execution of its plan for the reorganization of Morocco without regard to Spanish co-operation. M. Jonnart, formerly Governor-General of Algiers, has been appointed Resident-General of Morocco, for the purpose of establishing the French protectorate. Señor José Canalejas has for the fourth time in fourteen months presented to the King the resignation of his Cabinet, but King Alfonso assured him of continued confidence in his policy, and so Canalejas, after reconstructing his Cabinet, remains at the head of the Government.

Captain Amundsen Captain Roald Amundsen has changed his plan of starting out immediately for a trip thru the northwest passage in the "Fram." He will give some lectures in Australia and write a book in Argentina and perhaps also go on a lecture tour to Europe and America before rejoining the "Fram," July, 1913, at San Francisco, for his Arctic explorations. None of his scientific observations have been given out, but in supplementary cablegrams from Hobart, Tasmania, to the *New York Times* and allied papers he has added some further details of his experiences. The four Norwegians who accompanied him on his dash to the South Pole are Helmer Hansen, Oscar Wisting, Sverre Hassel, Olaf Bjaaland. No alcoholic liquors of any kind were taken on the sledge journey, altho while in winter quarters grog was served every Saturday night as a treat. Amundsen insists upon

naming the polar plateau after King Haakon, notwithstanding the protest from Sir Ernest Shackelton that this is the same as he named after King Edward VII. Shackelton, he says, was on an ascending plain when he turned back, while Amundsen, after reaching his greatest height, 10,750 feet, in nearly the same latitude, came to a plain sloping southward all the way to the Pole.

The Chinese Revolution Yuan Shi-kai has received the first instalment of the loan made by the Powers, so he can now satisfy some of his soldiers, but his position at Peking is still precarious, for none of his troops are to be depended upon even to maintain order in the capital, and a new foe has appeared in the field. Gen. Sheng Yuan, formerly Governor of the Province of Shen-si, is reported to be marching from the Province of Kan-su, at the head of 10,000 men with the object of occupying Peking and restoring the Manchu rule. Envoys sent out to meet him by President Yuan, in order to dissuade him from his purpose, have failed to check his march eastward. Manchus and Mongols have joined him, and the northwestern provinces, unreconciled to the new regime, are likely to undertake a counter revolution. Wherever Sheng's army passes republicans are killed and the country laid waste. In Peking and Tientsin thousands of executions have taken place during the past week and the bodies, beheaded by the swords of the police and soldiers, are left to rot in the streets. It is the rabble who suffer, while the guilty soldiers escape. In Canton street fighting is frequent and a brigand named Luk is the dominant power in the city. The financiers of Great Britain, Germany, France and United States, who had agreed to provide funds for needs of the Government, are indignant because Yuan secured a loan on the side from an Anglo-Belgian syndicate, and they have refused him further advances. Russia and Japan have been invited to join in the "Four Power" loans, but before doing so they are anxious to secure international recognition for the exceptional privileges they claim in Chinese territories, Russia in Mongolia and Manchuria, and Japan in Manchuria.

The Republican Presidential Nomination

BY JACOB GOULD SCHURMAN, LL.D.

PRESIDENT OF CORNELL UNIVERSITY.

IN accordance with the general custom of the Republican party, to say nothing of the special ground of a meritorious administration, President Taft is entitled to renomination for a second term. There are, however, some Republicans who oppose this just and natural consummation and who are endeavoring to prevent it by bringing about for a third term the nomination of ex-President Roosevelt.

To this startling alternative there are objections of the greatest weight. The people today are frankly discussing them and the Republican convention to assemble in Chicago will be compelled to consider and appraise them. It is of the utmost consequence not only to the party, but also to the nation that a right decision should be reached.

The education of public opinion in the meanwhile is the one sure way of bringing about that result. It is a time for every citizen, and particularly for every member of the Republican party, to say what he thinks. We want the full light of public opinion at its maximum intensity of illumination. The ostrich policy would be fatal. As Bishop Butler used to say, things are what they are and the consequences will be what they will be; why then should we wish to deceive ourselves?

"Things are what they are." On the 8th of November, 1904, President Roosevelt under memorable circumstances, solemnly made this announcement to the American people and to the world:

"Under no circumstances will I be a candidate for or accept another nomination."

On the 26th of February, 1912, ex-President Roosevelt said:

"I will accept the nomination for President if it is tendered to me."

The latter statement is in absolute contradiction with the former. But apologists have arisen who tell us that President Roosevelt's pledge refers only

to a *consecutive* third term, and that when a man declines a third cup of coffee he is still free to take it tomorrow or the day after. But the main point is concealed under this wretched sophistry and juggling with words. Millions of men who refuse to drink more than two cups of coffee today take another cup on a subsequent day. And to decline a third cup of coffee this evening does not even suggest to anybody that you will not take it tomorrow or the day after. No one is deceived by your refusal. Indeed, it concerns nobody but yourself. It is different with the Presidency. That concerns 100,000,000 people. And as no mortal has ever been President of the United States for a third term, the man who on his election for a second term voluntarily and solemnly proclaimed that "under no circumstances" would he "accept another nomination," morally estopped himself, in the understanding and expectation of all mankind, from ever consenting to break the third-term tradition. And the people's belief in President Roosevelt's self-elimination from future Presidential candidacies gave him tremendous leverage during his second term, materially helped him to control the Republican national convention of 1908, and brought him universal praise (which Senator Lodge, the presiding officer, eloquently voiced to that convention) for his unselfish patriotism in following in the footsteps of Washington and Jefferson.

But his own refusal is not the only inhibition on the nomination of Mr. Roosevelt for another term. What he had in advance refused, the American people were in advance pledged not to offer him. The republic has never had the same man as President for more than eight years, and the anti-third-term policy has established itself as a part of our unwritten constitution.

The proposal to nominate Mr. Roosevelt for another term contravenes this

wise policy. At the beginning of the republic Washington and Jefferson declined a third term and established the custom. Grant wanted a third term—a non-consecutive one—but even the name and fame of Grant were powerless when arrayed against the enlightened political sentiment and sure political instinct of the American people.

The restriction of the President to two terms at most is the fundamental safeguard of the republic. If our democratic institutions are to survive, if the rule of the people is not to be supplanted by Cæsarism, the term of the Chief Executive must be rigidly limited either by law or by custom. One term of five or six years would probably be the best arrangement. But with us the practice of a century has sanctioned a maximum of eight years or two terms. If this limit is now removed, it is as certain as anything in the future can be that no other limit can be established. This is no guess, no baseless fancy. It is a truth demonstrated by human history. From a chief magistracy of more than two terms the nation would be insensibly carried, by the machinations of able and unscrupulous leaders, to a chief magistracy of several terms or to a life office. The power of the President, growing by what it fed on, would in this succession of terms easily transcend the limits fixed by the Constitution. And by a gradual and natural transition the Presidency would become a dictatorship or a Cæsarism.

We have seen all this happen in Mexico in our own generation. And the recent revolution in that country and the present insurrection are the blind gropings of the nation to recover its lost liberties. The same thing happened in Rome over two thousand years ago. The Roman Republic was destroyed by the removal of the ancient limit of the term of the Chief Magistrate. The proposal to nominate Mr. Roosevelt for a third term is an invitation to the American people to enter upon the career of modern Mexico and ancient Rome.

But would you limit the freedom of the people? If they desire Mr. Roosevelt for President, shall they not have him? Who is to say them nay? Shall not the people rule?

It is not the first time that liberty has been destroyed in the name of democracy. It is, indeed, in the people's power to choose whom they will for President. But having chosen, it is not in the power of the people to alter the consequences of their act. Whether we will or not, the removal of the two-term limit to the Presidency tends to transform republicanism into Cæsarism. Do the American people want this result? The way to avoid it is to retain the restriction which a salutary and approved custom has put upon the President's term of office and also the limitations which our noble Constitution has imposed upon his activities. The way to introduce Cæsarism is to lengthen the President's period of service; this will of itself lead to an increase of his powers and the establishment of a one-man rule. There are two courses open to the American people. They are free to choose either. But the laws of nature and history will force upon them the inexorable consequences of whichever alternative they adopt. Whoever votes for a third term by necessary implication votes for Cæsarism.

There is no other issue in our republic more fundamental than the maintenance of the present limited period of office for the Chief Executive. Hence, if the Republican party were to nominate Mr. Roosevelt next June in Chicago, it is safe to predict that the anti-third-term sentiment of the American people must inevitably lead to a split in the party. No other course would so certainly ensure the election of a Democratic President. At the same time the organization of the Republican party would pretty certainly fall into the hands of the radicals, who had secured the nomination for their candidate.

This raises the question of the place of radicalism in a Republican platform. In the past the party has not been radical. If it championed liberty it also enforced justice and protected property, and everywhere and always it revered the Constitution. Since the Civil War, with the exception of Cleveland's administration, the Republican party has been responsible for the government of the country. It has been a half century of orderly progress, of expanding liberty

regulated by law, of natural constitutional development with jealous regard to States' rights and watchful maintenance of the independence and efficiency, each within its own ordained sphere, of the executive, the legislative and the judicial departments of the Federal Government. There has been a protective tariff intended to encourage business and safeguard the interests of the wage earners, the manufacturers and the farmers. The country has prospered beyond any other in the world. Since trusts have appeared laws have been enacted and enforced to protect consumers against monopoly and business rivals against unfair competition. The tariff, which has from time to time been revised, still needs to be better adapted to existing economic conditions. And the anti-trust law should be supplemented by further legislation providing for the Federal incorporation of large concerns doing an interstate business and determining more definitely the criteria of illegal practices, so that business men may know as clearly as possible just where they stand.

These are the problems to which President Taft has been addressing himself. He has been extraordinarily successful in carrying out the policies of the Republican platform. And with perfect fidelity to the principles of his party he is now facing the new issues, for the settlement of which he is splendidly equipped by his administrative experience, his studies in economics, and his mastery of the law. He is a genuine Progressive Republican, who sees the needs of the present and the approaching future and who is molding policies to satisfy them. The reactionary worships the past, the radical flouts the past, but the progressive, while retaining all that is sound and valuable in the past, also vitalizes it with the living ideas of the present, and creates new institutions for our day and generation. Is there, I ask, in America a better exponent of progressive Republicanism than President Taft?

The issue, then, is very simple. Shall the Chicago convention in its platform renounce progressive Republicanism and declare its adhesion to radicalism? If so, President Taft would not be the proper candidate. And it is altogether

improbable that he would accept the nomination. But if the platform of principles adopted by the Chicago convention is in harmony with the Republicanism of the past and is hospitable to evolutionary and progressive development in response to the best aspirations, the soundest ideas and the wisest policies of the present, the party has a man foreordained to be its candidate, and that man, of course, is President Taft.

In my opinion, radicalism will not prevail in the Chicago convention. And for that reason, along with the third-term difficulty and the solemn pledge of 1904, I do not expect to see Mr. Roosevelt nominated. His radicalism has alarmed the country too greatly. The so-called "new nationalism" promulgated in his Osawatomie speech of 1910 was a scheme of highly centralized government, in which States' rights were menaced, and Congress and courts subordinated to the Chief Executive, who alone was regarded "as the steward of the public welfare," while business was put under the interdict that no man could make money unless it could be demonstrated (of course to government inspectors) that his prosperity was a benefit to other people. Obviously "new nationalism" meant Cæsarism in government and bankruptcy in business. The voters of New York, to whom Mr. Roosevelt commended it in 1910, responded with a Democratic victory, Republicans in great numbers staying at home or voting the Democratic ticket. (The Republican gubernatorial candidate received in 1910 only 622,000 votes, as compared with 804,000 in 1908.)

The country had not recovered from the shock of the radical program of "new nationalism" when Mr. Roosevelt launched a still more radical proposal. The history of civilization shows that when the courts are subordinated to the sovereign—whether the sovereign be a monarch or the people in their entirety—justice disappears from states and the rights of individuals and minorities are trampled under foot. The independence of the judiciary is the first principle of free government. Mr. Roosevelt now proposes to have court decisions reversed by popular vote. This is not only radicalism, it is revolutionary radicalism.

And it has given a painful shock to millions of citizens and alienated hosts of Republicans who formerly voted for Mr. Roosevelt. The meaning and consequences of this proposal, which is at once revolutionary and reactionary, have been admirably discussed by President Taft in his recent speech at Toledo—a speech that covers the whole ground

with great ability, with irresistible, convincing power, and with unusual fervor and animation. It is safe to say that if anything else had been needed to secure President Taft's renomination for the Presidency, it has been furnished by Mr. Roosevelt's attack on the independence of the judiciary.

ITACA, N. Y.

Fear and Ghosts

BY ANDREW LANG

“I DON'T believe in ghosts, but am afraid of them,” said a candid analyst of his own character. He believed not, but trembled. The same paradox is asserted of the philosophic Thomas Hobbes. He was afraid of ghosts which he did not believe in; but Hobbes was born in the year when his mother expected the advent of the Spanish Armada (1588). She was terribly alarmed, as became a woman who was not a naval strategist. Francis Drake, who did know his business, was not afraid; he asked leave to go and break the Spaniards up as they left their own harbor, Corunna, and have no more ado. We know that he could have done it with the greatest ease, because his ships outsailed the gallant Spaniards—“left us standing still,” says one of themselves; and he had the better served artillery. But Mrs. Hobbes, *mère*, did not know that, and was terribly alarmed; and so, says her famous son (famous, tho nobody reads him), “Fear and I were born together,” and he was afraid of ghosts, tho convinced that ghosts do not exist.

Such is human nature, which is desperately illogical. I am rather more logical than the philosopher of Malmesbury. I have always believed in ghosts since I can remember, and would certainly be horribly afraid if I awoke and saw a hideous hag, her face expressive of the worst passions, squatting on my bed in the deep of night—like the Colonel in Scott's tale, “The Tapestryed

Chamber.” I read it when I was a very small and nervous boy, and have never got over the original impact. Yet, tho in a less degree than Hobbes, I too am illogical, for I do not believe that there is anything really terrible in a ghost; and I never heard, on decent evidence, that a ghost did any mortal any harm, even, except once, in the way of nervous shock. Thus, tho I have passed unpleasant nights in haunted rooms, when in very bad health, I never had that feeling of *nameless horror* which we always read about in fictitious, made-up ghost stories. I never, in the most favorable circumstances, experienced an awful sense that I *was not alone*, that there *was a presence*, not myself—and not “making for righteousness.”

I have slept—or, rather, have lain awake—in bad health, in the room occupied, *de son vivant*, by that ghastly bride who was the original of Dickens's Miss Havisham, in “Great Expectations.” “She walks!” said my host when he bade me good night, and I had every reason to expect to see her. I was afraid that I was just the kind of invalid who was likely to see her, and get nobody to believe my report. I looked out for her. In Brahan Castle, when an undergraduate, ill and overworked, I had the haunted wing to myself, and never saw the ghost, that of a butler! I had no sense of an awful Presence. In short, having lain in many professionally haunted rooms, always with reluctance and apprehension, I never

had any but a rational, tho disappointed, expectation of seeing "the bodiless gang about."

To be sure, once, in a professionally haunted house, at 4 a. m., I *did* hear the rustle of silken skirts approach my room, and did hear the feeble twiddling of fingers at the outer door handle of my bedroom; now that door *would not lock*. When I had heard enough of this, I asked aloud, "Who's there?" Nobody replied. There was silence; no rustle of retiring silken skirts, merely dead silence. Any man *ought* to have jumped out and cried "Boo!" But I was not on the level of the opportunity, and said, "Who's there?" A long course of haunted rooms in which nothing ever occurred to me has hardened me; at haunted Glamis no bogey ever perturbed me; but I candidly admit that I would rather not pass a night in the chamber where Sir Walter Scott felt so eery for one out of the two times in his life. It is an eery chamber.

Now, looking at made-up ghost stories, we have two recent batches. One is "More Ghost Stories," by the learned Provost of King's College, Cambridge. The other is "The Room in the Round Tower" and fifteen other ghost stories, by Mr. E. F. Benson. Each author candidly confesses his desire to make the reader's blood run cold, to make him apprehensive, to make him look anxiously about him in his bedroom. Each author has given me entertainment, but neither has "*frightened me*," as children say. Now, R. L. Stevenson in "Thrawn Janet" and "Dr. Jekyll and Mr. Hyde," and Hogg, in "The Confessions of a Justified Sinner" (try it, O readers who wish to learn to shudder), *have* "frightened me." I threw down the manuscript of "Dr. Jekyll" and rushed to the security of bed; so did a very different kind of man, reading the book alone in a Highland house—and both of us ran away at the same point in our studies. In my very early boyhood, Edgar Poe made me feel terribly frightened with "The Fall of the House of Usher." Is that the book to place in the hands of a morbid infant of ten summers? Many, many years later the style of the author seems to

"have flowery components" which rather mar his effects. For an author who never introduces the supernormal, Poe is creditably alarming.

Did you ever read Dr. Jessopp's plain tale of what occurred to him in the library of a country house, probably that of my Lord Orford? The scholar sat up alone, and late, in the library, diligently making notes from some rare old books. He admits that there was soda water in the room, about whiskey he says nothing. He had nearly finished his notes when he observed, sitting at the table at right angles to himself, a clerical person, robust, rather red-haired, very clean-shaven, whose large white hand lay on the table. This ecclesiastical dignitary wore an antique costume of corded silk, with a rather high erect collar. The learned archeologist went on with his annotations (how I envy his pluck!), and paid no attention to his companion. But, laying down one book and taking up another, the last which he had to consult, Dr. Jessopp remarked that the priest was still there, dignified, handsome and silent. The doctor admits that he now began to distrust his nerve. He finished his work, replaced the books on their shelves, drank some soda water, lit his candle, and went to bed, without saying "good night."

Reader, wouldst thou have acted thus nobly? I confess that I would have made a bolt for it as soon as I saw the cleric, probably a martyred Jesuit of the cruel days of Queen Elizabeth. The learned antiquary told the tale in print, because people were always asking him about it.

Why is it that this simple narrative "gars me a' grue" more than all the horrors of Mr. Benson and the Provost of King's? Probably just because there is nothing horrible or malignant in the demeanor of the appearance, except that he was certainly not a man of mortal mold. But that is a good deal, and the thing might happen to any scholar, alone, after midnight, in an old library, making notes, for all I know, on the persecutions under Queen Elizabeth. I, too, am alone, late at night, as I scribble, and I find myself looking over my shoulder. Other men might have in-

vited the Elizabethan specter to take "a modest quencher," not I, and Dr. Jesopp left him to help himself.

Never but once did I think myself—for a moment, in the dusky gallery of a haunted castle—in the presence of the visible unseen. In that fraction of time I felt the sensation of cold in the region of the spine which people do feel in ghost stories. But I went down to dinner, sincerely believing (I now admit, on insufficient evidence) that the specter was a housemaid. In almost all well authenticated ghost stories known to me the observer begins by thinking that the apparition is a normal human being. Consequently he is not in the least alarmed. He is only perturbed when the thing goes into a room with no outlet, in which, on examination made, there is nobody. A man and his wife, solid, respectable owners of a very recently created peerage, took a house in the country. The lady at once saw, in a mirror opposite her at dinner, in the long light of a Scottish summer, a woman in black walking on the drenched lawn. There might be a right of way, she did not know, and merely thought "that woman will get her skirts very wet." When she met the woman in black in the grounds, and in the house, she said nothing to anybody, but when her husband saw the woman in the drawing room and remarked on the singularity of the intrusion, Lady ——— confided her own experiences to him. He kept on seeing the woman, she kept on seeing her; the servants complained of seeing her, and she advised them to take a pill! But she confessed to me that, the more frequently she saw the woman in black the less she liked her, and at last was averse to being alone. So they left the house at the end of their lease.

There was no terror, no *metus cadens in constantem virum*, which, in old French law, justified the breaking of a

lease. But a prolonged acquaintance with the woman in black culminated in a slight aversion.

Now, in made-up ghost stories, we commonly begin with a terribly sultry evening, and an apprehension of evil, then of an evil Being, and then with terror which is only not paralyzing because of our extraordinary courage and fortitude! Sometimes our dog actually dies of fear, always he is terribly alarmed. I know but one instance in which any person, a young kinswoman of my own, was accompanied by a dog, a Dandie Dinmont terrier, when first the dog, and then the young lady, saw the Appearance, on the top of Skelfhill, in Teviotdale. The dog was both angry and terrified; not so the lady, who recognized an intimate friend of her own. But when the friend softly and suddenly vanished away, she knew why the dog was so much alarmed, and sitting down, she very properly made a note of it, on a piece of paper. Nothing came of it. The friend, some hundreds of miles away, had been dressed as the phantasm was dressed, and had been walking down a hill. That was all! But the dog had seen the phantasm, and was angry and afraid, like people in ghost stories. Thus, it appears, there must have been something uncanny and visible.

To come to the end of my meditations, there seems to be nothing fearsome, nothing calculated to strike terror, in a ghost—as long as the observer does not know or suspect that it is a ghost. But when he believes that it is, then the unknown nature of the entity does often cause alarm. A dog, on the other hand, recognizes at once something in a ghost which both angers and alarms him; *why*, we are unable to say, in our present perhaps irremediable ignorance of the nature of ghosts and the psychology of dogs.

THE "FRAM" AND HER ESCORT AT ANCHOR

The "Fram," rightly named "Forward," has gone farther north and farther south than any other ship. In the expedition of Dr. Fridtjof Nansen in 1893-6 the "Fram" made 7,000 miles in Arctic waters, 3,000 of it while frozen solid in the moving ice sheet. The "Fram" was constructed for such purposes by Colin Archer and is stanchly timbered to withstand the ice pressure. Captain Nielson took the "Fram" into the Antarctic and left the Amundsen party at Framheim on the Bay of Whales, then returned to Buenos Aires to wait till the time came to go and get them. The illustrations for the article by Mr. Bridgman are from copyright photographs of the Doubleday, Page & Co. Syndicate.

The Discovery of the South Pole

BY HERBERT L. BRIDGMAN

[Mr. Bridgman for many years has been an authority on polar exploration. He was in command of two Peary exploring expeditions and is secretary of the Peary Arctic Club.—
—EDITOR.]

THAT Roald Amundsen, the Norwegian, with four comrades, reached the South Pole, December 14, 1911, and remained there three days, is fully established. Just how the world believed for a day that Scott, the Briton, was successful, may never be explained; but the tale which Amundsen tells of his journey, nearly 800 miles from his winter quarters, over the great ice barrier, across the perilous glaciers, and traversing the interior elevated plateau, until he found himself descending an easy southerly slope, is all convincing, impregnable in its rugged simplicity, and compels full and literal acceptance. No such miserable imposture as for weeks clouded the attainment of the North Pole is possible, in making of the history and allotting the credit in the solution of the other antipodal polar mystery. Amundsen's success, however, only puts a keener edge on the curiosity and eagerness with which Scott's return and report are awaited, for there can be no doubt that when he comes he will give a good account of himself, and will bring rich accessions to scientific knowledge, whether he shall have attained or not the ultimate goal of his desire and ambition. One cannot help noting that the two geographic prizes of the ages, for which men have for centuries striven and perished, have both been gained within the short space of little more than two years, and that it is one of those strange, but only apparent coincidences that the conquest of one hemisphere follows hard upon that of the other. It is, however, no accident nor coincidence. History repeats itself in the polar as in other zones, and an Amundsen's success in the south was but the inevitable harvest of seed sown, of experience and methods in the north. Apart from a tinge of regret that Scott, who really broke thru the south polar barrier, and with his magnificent advance to 82.17

made Shackleton's 88.12 and Amundsen's final success possible, is denied the satisfaction and honor of having the flag of his country at the end of the road along which he had carried it so far in the van of all others, it is impossible to withhold credit and admiration for the manner in which Amundsen and his

THE "FRAM" SOUTHWARD-BOUND

party performed their task. Whether it was quite ethical or sportsmanlike for them to enter a field in which others were working, to use the means which others had proved and tested, to announce that the Arctic was the destination, when all the time more than a hundred dogs were 'tween decks, specially protected against the tropical heat, all these and other questions ethical like them, are not "justiciable." Whether in exploration all's fair, as in love and war, may not yet be fully settled. It is true that nothing succeeds like success, and conditions, whether of good or evil repute, are quickly lost sight of in estimating the final result.

That Amundsen earned his victory honestly, and by the hardest kind of work the most patient training and discipline, by conspicuous qualities of leadership, of good temper and indomitable will, there can be no doubt whatever. His northwest passage in the tiny "Gjoa," with its years of hourly observations, delicate and refined, his midwinter march over the Alaskan mountains from Herschel Island to Eagle City, those years of severest test demonstrated the

stuff of which he is made, both mentally and physically, an ideal leader, one who must win, if success be possible. Tho Amundsen's narrative, like all of real explorers, is modest, self-restrained and unpretending, it is evident that the route was most arduous and in some cases fraught with great peril. Whether any other party than the Norwegians, trained to the skis, the dogs and the sledges, could have surmounted the obstacles, is doubtful. Certain it is that, led by Amundsen, a host in himself, no team could possibly be put in the field by any nation which could hope to succeed in an undertaking in which these sturdy Norwegians had failed. It is a high testimonial to the skill and ability, to the courage and foresight with which the expedition was handled that there was at no time peril from cold nor hunger, and that every member returned uninjured and in perfect health.

Naturally, the instant, immediate question is, what did it all amount to and what are the net results? Answer must be for the present partial and general, for the scientific observations—and they are voluminous—are yet to be re-

duced and discussed, and that may require years. The determination of the Pole has, however, verified the geographical work and predictions of Scott and Shackleton. A lofty range of mountains, which may be an extension of the South American Andes, traverses the continent, and the deep indentation, Ross Bay, bears that great, floating, paleocrystic ice mass known as the barrier, a factor in physical geography, duplicated nowhere else in the world. Temperature and wind measurements do not differ materially from those of the earlier explorers, and when Scott shall bring his and the two series are compared and collaborated, interesting and important laws in Antarctic meteorology may be established. Valuable contributions should also be made to the store of knowledge of terrestrial magnetism, for Amundsen is a specialist in that branch of research, and before his northwest passage made of it a thoro study at the Hamburg Observatory. Combined with the full and accurate data gathered by Charcot, on the opposite side of the southern continent, the subject of Ant-

arctic magnetism, the course and intensity of its currents, may well be regarded as definitely near final and accurate statement. It may be hoped that Amundsen will bring data which may throw light on the problems of electricity, particularly aerial electricity, for he reports many and brilliant displays during the winter at Framheim of aurora australis. In short, while the expedition had one prime objective, and accomplished it at the Pole, much scientific store and enlargement has evidently been secured, and will make its record memorable, for these Norwegians are thoro and patient workers.

Now, the curious spectator observes, "It's all over; no more worlds nor poles to conquer; exploration will soon become a lost art." Far from it. In the words of Paul Jones, "We have just begun to fight." Henceforth, exploration becomes one of the exact sciences, and field work will take rank as truly and as creditably research as that which is performed in the laboratories at home. North and South Poles captured, the entire earth is from this time forward the

KING HAAKON WISHING THE NORWEGIAN EXPEDITION GODSPEED

field, and no one can say that any point on the globe, except possibly the summit of Everest, in air too rarefied to sustain life, is denied to man. Hereafter, instead of fewer, more expeditions should be kept in the field, until the whole world is accurately mapped and its phenomena measured and recorded. Each civilized nation will, of course, go on as ours and complete the detailed survey of its own domain, and some sort of convention or allotment among the nations should be made for the portions of the globe uninhabitable, and without commercial or economic value. These may be and often are free from the disturbing activities and influences of civilization of the highest scientific value. In this new stage and development of exploration, of alliance and distribution, a highly promising field is opened to the young International Polar Commission, whose president (Cagni) commanded the Italians landing at Tripoli. The campaign for the physical knowledge of the globe on which we live has hardly more than begun, and its future was never so in-

viting and auspicious as at this moment. For this is the real, the true meaning and significance of Amundsen's victory, as it was of Peary's. Always it is asked, "What good will it do?" and "What is the use of it?" And here is the answer: It is the demonstration that man is the master; that nature has no stronghold within which she may intrench herself and defy the approach of humanity. To demonstrate this fact, though it has taken hundreds of years to do it, is worth all it costs, for it has been done in the South as in the North, by patience, courage and fortitude, by intelligent adaptation of means to ends, solving one problem and establishing one fact after another by that steady, undaunted, unflinching pursuit which is the price of all truth and all success worth having in any sphere of life or duty. So it comes to the same end at last, that the physical victory is moral; that the attainment of the Poles and conquest of the globe is but another phase of the age-long strife of mind against matter, another victory of the indomitable soul of man.

BROOKLYN, N. Y.

Needed Panama Canal Legislation

BY W. C. ADAMSON

[The completion of the Panama Canal is already within sight and ships are now being built in Europe with the object of navigating it, but the question of tolls, on which the traffic depends, is still unsettled. Judge Adamson, member of Congress from Georgia and chairman of the committee in the House of Representatives having the matter in charge, is especially competent to discuss it.—EDITOR.]

A CANAL across the Isthmus has been talked about for nearly four centuries. If some of the kings of Europe had reigned on the American continent and had owned the property and the people on this continent today, just as monarchs of old owned the property and the people over which and whom they reigned, it is possible that an isthmian canal would have been constructed long ago. Kings and potentates, with the blood and sweat of their toiling millions and the treasure exacted

from their subjects and extorted from conquered people, constructed all the great works of antiquity. Commerce is not able, and never has been, to control enough cowardly and selfish capital to accomplish such an enterprise. Quasi-private capital did construct the Suez Canal in an easy place where history locates an old channel, and to dig which American enterprise, led by such men as Colonel Goethals, would have considered a mere holiday task. Yet capital which constructed that had substantially

the backing of three or four of the most powerful governments in the world and a guarantee of such business that the net income requires only three years in which to double the capital, invested or putative. The Federal Government would have been delighted if commerce had been willing to construct the canal across the isthmus thru which we could pass our Government vessels, and would gladly have paid liberal tolls therefor rather than incur the expense of constructing the canal.

We waited a long time. Hundreds of propositions were exploited. Hundreds of concessions were bruited about in quest of capital. Under the Clayton-Bulwer treaty, by which we were embarrassed for fifty years and prevented from building a government canal, private capital could have constructed one under the auspices of the United States. When it became apparent to all men that private capital would never construct it and we realized suddenly, from the scare of the Spanish War and our suspense during the long voyage of the "Oregon" around the Horn the absolute necessity of the canal as a war measure, popular opinion literally forced Congress and a reluctant Administration, despite the powerful and persistent opposition of the transcontinental railroads, to enter upon the construction of the canal. Accordingly, we modified the treaty so as to permit our Government to operate and protect by military police a Government-built canal.

It is unnecessary to refer to the circumstances attending the change of route and the creation of a friendly republic as ancillary to the canal project, or to the change of base from a sea level to a lock canal. We wanted a canal. We needed a canal, and when the changes were made those who opposed them yielded their judgment and continued their co-operation, with the result that we are about to realize the triumph of the greatest engineering enterprise of all the ages, thru the skill and fidelity of four or five splendid, true and accomplished engineers and health officers, who, honorable and distinguished as they all are, are the more honored by having Colonel Goethals at their head.

Our next task is to legislate for the operation of that canal. Ever since the initiation of the enterprise the Interstate and Foreign Commerce Committee of the House has kept its face steadfastly set toward the construction of the canal, and has refused to be diverted by outside issues and irrelevant suggestions. I believe the committee is still actuated by a like singleness of purpose—to have the canal opened when completed and operated for the best interests of our Government. During the period of its construction statesmen with governmental theories to exploit have insisted on premature legislation for a civil government of a people which did not exist and which perhaps never will, and dreamed and talked about an ideal population colonized in a mild climate and a fruitful land, where a prosperous people, living under a model government, would command the envy and admiration of the world. We saw nothing in the treaties and the canal act but authority to acquire sufficient land for the construction, maintenance, operation, sanitation and protection of the canal. There was no authority to purchase any land or acquire sovereignty for any other purpose. No such authority has yet been secured. We employed some laborers there, but there was no difficulty about controlling them while we had them employed and deporting them at the end of their service. We had a number of splendid Americans there at work, but they continued to be American citizens. Their control and government involved no trouble and they were glad to enjoy well-merited leave of absence in the States as often as possible. As the work nears completion the laborers will gradually disperse to the lands from which they came. We hope during this session to provide such legislation as will enable the Canal Commission, as the American employees on the isthmus finish up their work, to winnow them out, select and retain the best men for future use, allow the others to return to the States, and in finishing up the canal with those who remain, rapidly train them in the operation of the locks and the management of the canal. Colonel Goethals has wisely asked for that authority, and it

is untrue that anybody in Congress has manifested any disposition to ignore his suggestion in that respect or delay action thereon.

Among other unjust suggestions is one that has been persistent—that shipping ought to have long notice of what tolls will be, in order to adjust their shipping facilities to meet the new conditions which the opening of the canal will inaugurate. Developments have shown that the authors of that rumor are a few persons who are either interested or expect to become interested, if offered sufficient inducement in the way of preferential advantages, to build some new ships. Strange to say that when, in the fullness of time, and at the right time, and in plenty of time, the committee undertook the work of constructing legislation to open the canal and operate it for the use of the American army and navy, and incidentally to secure all possible revenue from the commerce of the world for the benefit of our treasury, depleted by an expense of almost half a billion dollars, this same little coterie of speculators and would-be beneficiaries of special favor and discrimination delayed the committee for about three weeks and threaten to delay Congress for several months with the demand that the canal shall not be opened and operated until provisions and concessions shall be made to divert from the treasury the tolls which certain men would have to pay provided they build ships and run them thru the canal. That looks a good deal like gall when you reflect that ninety million people, probably not more than one per cent. of whom own ships or intend to own any ships, have devoted their taxes to construct this canal and are entitled, when the use thereof by the army and navy will not be interfered with, to have some revenues go into the treasury. Wise statesmanship ought to provide that all possible revenue shall go into the treasury. As the canal is a war measure, the original cost may be regarded as expended for the national defense, and the people may be satisfied if commerce is taxed only enough in tolls to pay for maintenance and operation, but even if, in addition to operating expense, revenues enough could be realized to form

a sinking fund which would gradually reduce the original cost, it would be fairer to all the people than to give the tolls to a small per cent. of those engaged in our shipping, which in all constitute so small a portion of our population.

It is not my purpose here to discuss ship subsidy, but I do protest that the canal enterprise ought not to be hampered with the demands of those who clamor for it. The Administration ought to be allowed to open and operate that canal without embarrassment by any collateral demands or personal interests. In the first place, if a ship subsidy is tolerable at all it should be given to all American ships alike. The plea that the instrumentalities of commerce between the States should be unshackled applies as well to the ships operating between New York and Georgia or between San Francisco and Seattle as between any port on the Atlantic and any port on the Pacific. If we were going to make a bonus or a bounty to the coastwise trade it would be fairer to adopt a scheme that would benefit all. To give to a 4,000-ton steamer a dollar a ton twelve times a year would be giving that ship nearly \$50,000 a year to do business between two States, while a sister ship doing business just as beneficial and important between two States on the same side of the country would have no participation in the benefits. If the shipping interests insist on taking the money of the people or diverting it from the treasury, they ought at least to consent to a scheme that is fair and would treat them all equally. But Congress sits here of late nearly all the time. In recent years it has been meeting three times a year, and I do hope the people will be wise enough this fall to necessitate an extra session next year. So that Congress can at any time it wishes provide any sort of assistance to American shipping that it wishes to provide, and make it fair and applicable to all American ships alike, and in fairness to the Administration leave the canal enterprise unencumbered and unembarrassed by consideration of that subject.

I will not discuss here the treaty stipulations, which, in my judgment, and in the judgment of everybody who is not

trying to reason around the plain language, unquestionably forbid our allowing any preference, directly or indirectly, either by remission or repayment of the tolls, to any ships except the official ships belonging to the Government of the United States, which, as the owner of the canal, is accorded by the treaty the inherent right to pass its ships and the official ships of the Government of Panama, with which the United States was compelled to contract in order to construct the canal thru its territory, and which as quasi owner, legitimately has the right enjoyed by the Government of the United States to pass its official ships.

So far as I am concerned, I did not require a treaty with Great Britain to induce me to vote honestly in favor of the treasury of my country against the selfish demands of private interests. Those who demand that preference are already the most thoroly and highly protected people engaged in any business on earth. They are granted the exclusive traffic between all the ports of the greatest and richest country the world ever saw, the domestic commerce of which exceeds the combined commerce of all the balance of the world. When the canal is finished their passage thru that will immensely improve their condition. The low tolls which will probably be fixt will exclude all possibility of profitable competition on the part of the transcontinental railroads. The coastwise ships will enjoy the absolute monopoly of the canal so far as coastwise trade is concerned. As no ship of the world can compete with them, and the low tolls will exclude the competition of the railroads, the tolls will be absolutely immaterial to them, and the only two men appearing before us representing steamship companies which have had the courage actually to do business and build ships and operate them profitably in the coastwise trade have testified before our committee to the immateriality of those tolls and the certainty that the canal will be profitably used by coastwise ships, regardless of the tolls. It is strange that one of the arguments insisted on in favor of a preference is that they have a monopoly of the coastwise trade, as if one discrimination in their favor would demand another dis-

crimination in their favor. The very fact that all foreign ships are excluded from competition demonstrates the immateriality of the tolls. Some of them insisted that they could not do business at all if they had to pay tolls, that no new ships would be built, and those in existence would rot idle in port. One of them said that there is no use to open the canal at all if the American ships are to be charged tolls, as it would do the country no good. One of them, in a letter, charges that all who oppose differential tolls on the canal are enemies to American ships and are stirring up animosity and opposition to American ships. There was never a more far fetched nor unjust accusation. There are other and better means of reviving the American marine, and I believe I desire the success of our merchant marine more than any man who wishes to complicate consideration of the canal operation with an effort to extend preferential treatment. Some of them advanced the hackneyed, exploded argument that the shippers would get the benefit of the tolls because the different lines would compete, reduce rates, fritter away the tolls given them, and pass them on to the shipper. All human experience contradicts that except in sporadic cases.

The testimony demonstrated that combinations would hold up the rates so that the remission of tolls would never benefit the people. One man who pleaded manfully in behalf of the shippers, describing himself as a large shipper who would be ruined if the American merchant marine was not given free tolls, finally disclosed before leaving the stand that his company owned and operated twenty-six coastwise ships, yet he, with all the others, talked about patriotism and honesty, never once offering to give the Government anything to show his patriotism. They have never offered to give the Government free freight for its soldiers and munitions of war and necessary freight. The extent of their offer is to permit the Government, in case of war, to buy their ships at a high price to be liberally fixt by arbitrators. If we are to enjoy the long period of peace prophesied at present those ships would be worthless tubs by the time we needed

them for war, and the fact still remains that with our resources our Government can always buy as many new ships when it needs them as other nations can buy. I have said this much because so much fuss and fustian has unjustly filled the public press to mislead the popular mind as to existing facts and conditions.

The theorists still offer to discuss the question of colonization in the Zone and elaboration of governmental exhibition. The truth is, when the lakes to be created by the dams are filled, all the lowlands on the Zone will be flooded. The highlands are not fit for cultivation, and such as are lie around the watersheds which must supply the water for the towns on the Zone and at its terminals. Certainly there ought to be no pollution of the watersheds by any population. As the land was acquired solely for the purposes already mentioned, including sanitation, we ought to respect that demand, and as protection is also included in the purposes, it is manifest that we ought not to hazard so valuable an enterprise by the presence of any unfriendly population. Prudence and safety demand that there shall be no population between the two dams which make the 36 miles of summit level of the canal. Necessarily the American operatives of the canal and their families will live in the towns at or near those dams. Such military forces as the Government sees proper to use on the Zone to police the canal and for other purposes may be located in camps and barracks located along the Canal Zone between those two dams. So the only occupants of the Zone, as they should be, will be our soldiers, sailors and marines, the American operatives of the canal, the government of all of whom will present a small problem and can easily and simply be provided for in connection with and as adjunct to the operation and protection of the canal itself.

The things now necessary to be done which are desired by the Canal Commission and which I believe will be provided for at the present session of Congress, are: First, to authorize the selection of an operating force from the present American employees as the present force is reduced. Second, the fixing of tolls or the authorization of the President to fix and change those tolls at his pleasure,

to be collected without discrimination from ships in passage treated in every respect without discrimination, except the official ships belonging to the governments of the United States and the Republic of Panama, and the further authority to the President to make and publish rules and regulations for the canal operation. Third, to legalize and ratify the executive government existing up to this time *de facto*, recognize the laws in existence, and provide for the substitution of a simple arrangement for the civil administration in connection with and under the direction of the Governor of the Panama Canal, who in time of war shall instantly submit in all matters to the authority of the commandant of the fortifications, who shall control in all things during the existence of war. Fourth, provision for a simple and satisfactory system of courts for the preservation of order, the adjustment of civil differences, the punishment of crime, and the jurisdiction in admiralty. Fifth, to authorize the maintenance of coal supply and the supply of such other things as we may find it necessary to supply to our own ships and incidentally to other ships that patronize the canal. These are the essential things, in all of which Colonel Goethals and the Administration appear to be in complete accord with the views of myself and a majority of our committee. Whatever may be the views of the Secretary of War or Colonel Goethals or some members of our committee as to possible means of encouraging the American merchant marine, civil government, colonization, government operation of ship lines, or many other questions, they all agree and insist that the opening and operation of the canal shall be differentiated from those questions and unembarrassed by their consideration. They think all other propositions should be postponed, at least, even if other and better means cannot be devised to promote them, and allow the Administration to open the canal and put it in operation as simply and promptly and easily as possible, and leave developments to determine and point out what variations should afterward be made and what other and different things it may afterward be deemed wise to undertake.

THE LITTLE THEATRE

BY MONTROSE J. MOSES

WINTHROP AMES

Mr. Winthrop Ames is now the director of one of the smallest and one of the most exquisitely dainty playhouses in America. Out of the New Theater venture he has come with firm conviction that between the audience and the actor a very intimate atmosphere must be maintained. The only way in

which this may be consummated is to reduce the physical proportions of the building. The subsidized New Theater was unwieldy; one could not see in it, one could not hear in it. With difficulty was it made possible to speak or act in it. There were 2,500 seats, and the line of vision from the top gallery was abnormally long.

In the Little Theater Mr. Ames has gone to the opposite extreme. His auditorium contains only 299 seats. All theaters with 300 seats and over have to conform to certain exacting requirements of the Building Department. There are no boxes and no balcony. As a theater it is complete; it is the auditorium of a large playhouse put under the reducing glass. There are others of its kind abroad: The Little Theater in London, Reinhardt's Kammerspiele in Berlin, and the Théâtre des Arts in Paris. And they all seem to be pledged to the same artistic aspirations: to select those plays which depend for their complete grasp upon subtle shades of voice and expression.

The building is colonial in structure—mottled red brick with stone trimmings and green shutters. By using bay trees as decorations the effect is obtained of a house set back in a garden and seen above a high wall. In the auditorium everything shows refined taste and is subdued in tone. The walls are tapestried in Gobelin designs and paneled in walnut; the curtain is rich in blue and silver, with tapestried borders. The seats are luxurious and not crowded together. In no way does it give one the impression of a hall; it is a complete theater on a small scale. Many of Mr. Ames's ideas are borrowed from his former venture; his two years' experience as director at the New Theater has served him well. He has a revolving stage, so that there may be no delay in change of scene; he has every latest electrical appliance, and his dressing rooms (all alike, so as to abolish the "star" idea) are ample and airy. The Little Theater has a personal touch about it that makes it a home rather than a place of public amusement.

The absence of balconies and the forced raising of prices unfortunately suggest that Mr. Ames's venture is strictly an aristocratic one. But such is not his intention. If conditions allow, he will give popular matinées at popular prices. He assures his public that the physical scope of his house necessitates the price. And as a return courtesy on his part, he serves tea without charge in a room excellent in taste—more like a private room than anything else, with its William and Mary furniture, its open fireplace and its lace-capped maids. One feels like a guest at a week-end housewarming.

It is this sense of privacy which marks The Little Theater. But it will only be able to reach a very small proportion of the people.

It would seem almost that the physical proportions of The Little Theater will limit the character of Mr. Ames's audience and of his plays. More than likely, in the selection of his dramas he will bear in mind special audiences wanting plays that, because of their intense intellectual appeal, are barred from larger theaters. Hence he will have greater opportunity to cater directly to the intelligence, to the delicate imagination and to the literary sense of particular audiences.

At first New York will regard The Little Theater as a fad. The curtain rises at 8.45, a time which marks the desire of those more intent on a good dinner than on the first act. It is after the novelty has worn off that Mr. Ames will have to establish his venture.

Mr. Ames has announced a number of his plans. Beginning with Galsworthy's "The Pigeon" as his evening bill, for special matinees he will give a one-act play, "The Terrible Meek," by Mr. Charles Rann Kennedy, author of "The Servant in the House," together with "The Flower of the Palace of Han," which Louis Leloy adapted from the Chinese, and which Mr. Kennedy translated from the French. There is likewise in preparation Schnitzler's "Anatol," Mr. Gilbert Murray's version of Euripides's "Electra," and three one-act plays by M. Maeterlinck—those which illustrate the Belgian's "marionette" theory. I mention these since they are to be had in book form. But Mr. Ames has likewise accepted for presentation a modern satire of New York life by Mr. John T. Hayes, entitled "One-Two-Three and Out-Goes-She," Miss Githa Sowerby's "Rutherford & Son," and a dramatic version of "Snow White," with which he hopes to make special appeal to children. The one criticism that might be lodged against this assortment is that it is too haphazard.

In comparison I select a few titles from the repertory of Reinhardt's Kammer-spiele, showing a tendency to be more restricted in choice. These produc-

tions are apart from his Deutsches Theatre spectacles of "Sumurun," "The Miracle" and "Oedipus Rex." Within recent years he has produced Ibsen's "Ghosts," Maeterlinck's "Pelléas and Mélisande," "Sister Beatrice," "Agla-vaine and Sélysette"; Shaw's "Man and Superman," "Major Barbara," "The Doctor's Dilemma" and "Candida"; Lessing's "Nathan der Weise" and Goethe's "Clavigo." I asked Professor Ordinsky, who is Herr Reinhardt's representative in America, what was the artistic aim of the Kammer-spiele. "Ah," he exclaimed, "it is almost impossible to express by words our artistic aspirations. But always we strive to bring out the soul of a play. It is an intimate feeling we have. We cannot talk about it; we do it."

Mr. Ames now joins the ranks of those who have more faith in the long run system than in the repertory. Here again he is prompted by the size of his theater, for only thru a long run and "road" engagements will he be able to make any appreciable return on his investment. Mr. George Tyler rented The New Theater for his production of "The Garden of Allah"; according to his own statement, 302,973 persons have attended 115 performances. Mr. Ames can never hope to compete with such figures. It is his one aim to make his project self-supporting. We discount his statement that balcony and gallery are not needed in a theater. There is still truth in the manager's belief that his profits are all upstairs. We do agree with him, however, that the moving picture theaters are killing gallery patronage.

Now, a playhouse is a playhouse, no matter what the size; the one requirement is that it must not be too large or too small. "Buntz Pulls the Strings"—New York's most prosperous play this season—is filling to capacity a theater seating 600; its acting would have been just as appropriate for the Empire Theater, but it would have been lost at The New Theater. If Mr. Ames is to be a potent factor in the theater world he must justify himself in a selective sense regardless of the size of his auditorium. He was handicapped at The New Theater, for small effects were lost. In his Little Theater there is only one style of

MR. AMES'S LITTLE THEATRE IN WEST FORTY-FOURTH STREET, NEW YORK

piece he will be unable to present—and that is a drama calling for large spectacular effects. Such a house as his may encourage the one-act drama as a distinctive form; it may help to foster a more dainty, a more subtle play. But no theater makes any special appeal to any special form of drama. Greater risks may be taken with plays not appealing generally, but that is all the difference between his and the commercial theater.

"The Pigeon" is the third of Mr. Galsworthy's plays to be given an American production. Mr. Ames has previously presented "Strife," and Miss Barrymore has appeared in "The Silver Box." "Justice"—which prompted the Home Secretary, Winston Churchill, to change the English prison laws—has not as yet been seen here. It is not too much to claim for Mr. Galsworthy that he is one of the most important figures in British

drama. In one respect he is a sentimentalist; the whole argument of "Justice" would denote that. In another respect he is a conventional Englishman; the plot and purpose of "The Eldest Son," just published, is indicative of that. But he is deeply conscious of the human problems back of social and economic conditions; this is evident to all readers of his novel, "Fraternity." To him, class is the sole topic of interest; bold amid social distinctions, he is a casual student of the rights and limitations of class. His view of society is from the standpoint of these rights and limitations. "The Silver Box," in poignant fashion, discusses the question whether or not there is a law for the poor distinct from that for the rich. I mention the variety of his attitudes so as to lead to the statement that "The Pigeon" deals in a sentimental, in a human fashion, with a social problem.

THE PIGEON AND TWO OF HIS "ROTTERS"

A scene from John Galsworthy's "The Pigeon," which opened at the Little Theatre on March 11. Frank Reicher (on the left) is the Belgian vagabond; Sidney Valentine (seated) plays Timson, an unemployed cabman; Russ Whytal (on the right) is the sentimental painter, Christopher Wellwyn.

In it he humanizes the question of charity.

The significance of the title centers in the hero, an artist with a soft heart, who, whenever confronted by poverty in the shape of some ragged individual, gives his last farthing, and then hands his card to the unfortunate. The first curtain rises on an evening when three of Wellwyn's beneficiaries determine to call upon him. Wellwyn's daughter, Ann, highly disapproves of her father's soft-hearted policy.

The entire potency of the play is to be found in the attitudes of a canon, a professor and a J. P., who have determined theories as to the dispensing of charity. But, as many a situation in the play demonstrates, they are blind to the facts around them. The diverse efforts to save the vagabond Ferrand, the

drunken cabby Timson, and the "rotter" Mrs. Meegan, are ill rewarded; while to the end Wellwyn is plucked. He even gives his new address to these social derelicts, after Ann has attempted to save him by moving to a new studio.

And what is the philosophy of it all?—for it is a philosophy rather than a solution. Wellwyn alone has treated these unfortunates as human beings, and not as pawns in a social theory of charity; he alone has come near to fulfilling Ferrand's philosophy. For the Belgian becomes eloquent.

"Those sirs with their theories," he says, aiming the force of his remarks at the canon, the professor and the J. P., "they can clean our skins and chain our 'abits—that soothes for them the esthetic sense. It gives them their good importance. But our spirits they cannot touch,

for they nevaire understand. . . . We wild ones—we know a thousand times more of life than ever will those sirs. . . . Be kind to us, if you will, or let us alone like Mees Ann, but do not try to change our skins."

In the end Mrs. Meegan pathetically tries to drown herself, but is saved by the law in the person of a bobby. And Ferrand, like the philosopher of the road he is and will ever be, breathes forth this epitome of his vagabond observation: "To wish us dead, it seems, is easier than to let us die."

"The Pigeon's" characterization is sharp and well defined. It has a tendency to be gray, but the humor relieves it. Mr. Galsworthy calls it a fantasy; it is just as much a slice of reality. "The Silver Box" is bigger in technique, "Strife" has more newspaper significance, "Justice" is more a case of special

pleading, and "Joy" is more feminine. But "The Pigeon" is perhaps the most delicate play of all.

Simultaneously with the production the play was published, so that readers will be able to judge for themselves whether or not we are correct in our surmise that in most artistic fashion Mr. Galsworthy has succeeded better than in any of his other plays in demonstrating the irony of things.

Looking back at The Little Theater, down the dimly lighted street, one sees at night a picture out of a child's book. The glow of the electric bulbs hidden among bay trees gives the colonial front the appearance of a dream inn, from the entrance of which come forth dainty ladies to be whisked away in automobiles. But it is no dream. The Little Theater is a fact over which New York playgoers may well rejoice.

NEW YORK CITY.

What Is the Matter with Our Army?

V. Its Piecemeal Development and Divided Control

BY MAJOR GEORGE H. SHELTON, UNITED STATES ARMY

[This is the fifth article in our series of articles under the title, "What Is the Matter with Our Army?" The four preceding articles have been contributed by Major-General Wood, Brigadier-General Wotherspoon, Brigadier-General Edwards and Lieutenant-Colonel Leggett. The author of this article is editor of the *Infantry Journal*.—EDITOR.]

WITH a highly qualified personnel individually, our military establishment is collectively inefficient. Whatever retrenchment in military expenditures is made, there can be no true economy so long as an army does not give in collective efficiency full return for every dollar expended upon it. Without organization, without distribution based upon scientific principles, and without means of putting whatever force is authorized promptly into the field in time of emergency, filled with trained men to its authorized limit, there can be no true military efficiency.

Organization does not mean increased

expenditures for military purposes. On the contrary, it means reduced expenditures. It does not of itself and directly interfere with any selfish interests. It does not mean militarism or vast standing armies. It does not necessarily mean any increase of strength whatsoever. It is not inconsistent even with decreased strength. It means nothing more than military usefulness in whatever strength is provided, and the economy of efficiency.

The trouble with our military establishment is that it is the product of a hundred and more years of puttering. It is the result of a system of piecemeal

development that has meant nothing in the way of collective efficiency, nor could mean anything if pursued a thousand years; that has meant increased expenditures for military purposes without corresponding return in military efficiency, and could mean no corresponding return though the expenditures were increased as much again. This is the reason, and the evidence is spread in the military laws thruout the statute books of the land for whoever runs to read. If we examine all of the innumerable military laws that have been enacted by Congress, we shall find that only rarely and at long intervals has effort been made legislatively to cover all parts of the army in a single act. The great mass of these laws have concerned themselves with some one part of the army, with a single staff department, or single special corps, or with one branch of the line of the army—the infantry, the cavalry, or the artillery. Not one of these acts has appeared to take any account of any other part of the army, nor even of the previous development of the part immediately concerned, further than to protect any individual rights granted under previous laws. None of them ever concerned itself with any thought of the army as a whole. Even those few acts which covered all or nearly all parts of the army were in general merely a collection of detached pieces of military legislation united in a single bill. None of them concerned itself with the army as a military or tactical organization—the only way in which an army can be used in war, and the only way it can be properly counted useful at any time. What other result could be expected from this than that each part of the military establishment should come sooner or later to the understanding that its development depended not upon any military policy or military system, not upon the development of the military establishment itself, but upon its own individual efforts? What other result could be expected than that sooner or later every part, consciously or unconsciously, should enter upon the purely selfish struggle for individual instead of collective development, for promotion instead of efficiency? *Esprit de corps* within each part of the military service

is both a proper and necessary thing, but *esprit de corps* is something finer and better than the spirit that must underlie internecine struggles of this character.

Time after time Congress, through its committees and members, has urged its inability to ascertain what the military establishment needed, because of the conflicting and opposing testimony offered by those who should not merely have known what was needed, but been in full agreement thereon. The end was, of course, that out of the innumerable military bills introduced, only those that could command the most influence in their favor were finally enacted into law. No such struggle as this could be carried along on even terms. The parts of the army which profited most by legislation became stronger and more influential and in a better position to seek further legislative development. The parts that were nearest to the capital, with established headquarters always in Washington, had the advantage of position which the parts outside of Washington, widely scattered and without the means of making influential friends, could not overcome. The various parts of the army consequently developed unevenly. The proportions, never correct, grew worse rather than better. The connection between the parts grew more attenuated and the confusion thruout worse confounded.

But the desire for organization means the beginning of unity of effort, and uniform thought and unity of effort are the fundamentals of military efficiency.

Primarily the army is beginning to know itself, because during the last few years it has been afforded opportunities that never occurred in the past to get together in its different parts and to become acquainted. These opportunities began with the Spanish war. Albeit this was not a war in any real sense of the term, the future will probably show it to have had more effect upon the military development of this country than any war in our history. As a matter of fact, its lessons are just beginning to be correctly interpreted. Then we have had the modern illustrations of the war in South Africa and the Russo-Japanese war to assist us in understanding the

lessons of our own little embroglio. This newly found acquaintance with itself is the broad cause of the new judgment. But in the light of the last few years there are revealed now the concrete things that have forced our military minds into a better and correct comprehension of our military deficiencies. With the Spanish war the army began to be used for national as distinguished from local purposes. After the war it was increased in numbers. By the conditions of the service its parts were brought together in larger groups. Its personnel has moved about more and has profited from its broader experience. The troops have been more in the field; not, it is true, in the way that they would be employed in war on a big scale, but still enough to indicate the use and functions of the different arms. All this has helped vastly. But there is more. Since 1901, vacancies occurring in the staff departments, with permanent headquarters in Washington, have been filled by detail of line officers who can hold their places on the staff for but four years and who must then return to their places in the line. Eventually, in this way, all of the staff, except certain technical departments, will be composed wholly of detailed line officers. The true interest of an officer thus detailed to a staff department must remain, therefore, with the line, where he still retains his place and where his promotion lies. This is altogether correct in a military way, since staff departments have no reason for existence except the administration and supply of the line, and the interest of their personnel thus belongs wholly in the line. But efficiency in the staff departments is an essential thing and their functions are of large importance to the line of the army. This interchange of service has helped vastly to bring the line and staff into closer sympathy and into better understanding of each other's purposes and needs, and has helped in this way to extend the feeling of unity—without which an efficient service is impossible.

Until 1903, the staff departments were independent of each other, and the only authority for the coordination of their efforts and the results of their work rested in the Secretary of War, to whom

the various department chiefs reported directly. There was, it is true, as a part of the War Department, an officer designated as Commanding General of the Army. Practically he was no more than a figurehead. He exercised no actual command. He, of course, also reported to the Secretary of War, but he had no practical control over the bureaus of the War Department, and having no bureau of his own and no means of developing the power or influence that this term unfortunately signifies, his influence was ordinarily less important than the influence of any single bureau chief. The Secretary of War was, of course, a civilian, bringing to his office ordinarily no military knowledge and certainly no knowledge of the intimate details of our military system. As a rule, he was in office but a short time and seldom long enough to acquire the necessary knowledge of the service to enable him in any proper measure to coordinate the work of the staff departments, and much less the line of the army and the departments combined. There was no single military mind in recognized control of the military establishment. This of itself was a violation of a fundamental principle of military systems. The efficient use of armies demands undivided responsibility, which means undivided control. An army properly organized is composed of a system of units on an ascending scale, each of which has an officer in command wholly responsible for the administration, supply, discipline and use of his organization, and whose interior control thereof is undivided and absolute. We followed this rule only thru the company and the regiment. There was, as now, no higher organization in the army where this was recognized, while the control of the army itself, as a whole, far from being under a single military mind, was divided practically among a dozen different staff departments. It was bureaucracy carried to the ultimate. But in 1903 an attempt was made to change this. The office of Commanding General was abolished. In its place was created the office of Chief of Staff and the General Staff, the latter with certain defined duties, recognized everywhere in the military world as essential to efficiency in the employment

of armies, but designed also as a body of assistants to the Chief of Staff. The Chief of Staff, exercising no direct command except over this body of assistants, and acting always by authority of the Secretary of War or the President, was given by the terms of the law definite authority to supervise all of the bureaus of the War Department and to coordinate their work. Coordination when successfully accomplished spells unity of effort and efficiency.

The members of the General Staff are now selected from the army at large and serve for four years, at the expiration of which, by the terms of the law, they must return to duty with troops and serve therewith two years before becoming eligible again for detail to the General Staff. It is a definite function of general staffs not merely to suggest the organization of the military forces, their training and methods of employment, but to fix the underlying principles that are to govern in the matter of organization and in the use of troops, and to prepare plans of campaign for any possible emergency. The nature of their work and studies in the preparation of these plans and in determining these principles cannot fail to impress upon them the necessity of efficient organization and to force their attention upon the employment of troops in their proper proportions and with regard to the proper exercise of the functions of each part.

The development of the detail staff system and of the General Staff has thruout met with bitter if at times unconscious opposition. It was not to be expected as humanly possible that the bureaus of the War Department, each with a system of its own, with a long history behind them, with eminently able men in their personnel, and with immense if divided powers, could immediately surrender their power without a struggle or yield wholly to a supervision apparently interfering with the dependence of function that had become habit. The institution of the General Staff was regarded with much suspicion both within and without the army. It had the appearance of "made in Germany." It was of foreign inception; it bore the hallmark of monarchy, and was seemingly opposed to democratic principles.

But in reality the General Staff is world-wide and a necessary part of every efficient military system. It represents interior control of the army by the army itself. It is the representative lawmaking body in the state of military autocracy. It is the most democratic principle ever applied to the military system. But with us it has had to struggle against suspicion and to struggle for its own place. Development under these circumstances has been slow, tho, we may believe, sure.

And the act establishing it was the most important single piece of military legislation ever put upon our statute books. Only thru its development shall we finally bring order out of the military chaos surrounding us now. It is essential, therefore, that the general staff system be understood both in principle and in application. It has not been understood generally without the service, and probably not wholly and widely even within the service.

While never during the whole piecemeal legislative development of the military establishment was a definite plan laid down by or for Congress upon which it could build in the future, it is also true that never before was the army or any considerable part of it able to prepare a plan of this kind that could have meant anything substantial or that could have united military opinion in its support. To attain organization and to provide for proper development, such a definite plan is essential, and its preparation is now possible, tho not easy. There are certain plain requirements. It must provide for the best use of every part of the service as now constituted, for the development of parts that are lacking, and for the eventual provision of an army that, regardless of its size, shall have all its parts in their proper proportions and united in a concrete whole capable of useful employment for its ultimate purpose either by itself or in combination with the organized militia and volunteer forces which would be essential in the event of a great war. In no other way can the army and the militia and the volunteers be combined into armies for the prosecution of war. To develop such a plan of organization is a matter of time and labor, and when

completed it must not merely meet the practical approval of the service at large, the Secretary of War and the Commander-in-Chief, but it must be put before Congress in such a way as not merely to admit understanding, but to give assurance that the mistakes of the past are not to be repeated. Such a plan, it is officially stated, is now in preparation by the General Staff. This of itself is a notable thing. For the first time in our history a body created for this purpose is working upon a plan for an army tactically organized, properly proportioned and designed to meet such military needs of the nation as can be foreseen, and to develop in the future accordingly as these needs develop. Any legislation for the military establishment, then, in the meantime must not merely complicate the work in hand by readjusting the proportions and relations of the existing parts of the military establishment and by adding to the volume of military legislation to be considered, but must nullify whatever has already been accomplished in working out the manifold details of organization.

It is this that makes the military legis-

lation now before Congress as a part of the army appropriation bill of such serious importance. True economy in the military service can be considered only with true efficiency. Correct organization would mean true economy, and it can be shown that with correct organization and proper distribution immense savings can be made in the upkeep of the military establishment. True efficiency is dependent wholly upon correct organization and proper distribution. True economy is not then to be reached thru other means. The legislation under consideration pretends to no organization of the army as a whole and to no new distribution of the troops. It is of no different order than the piecemeal legislation of the past. It means perhaps temporary retrenchment in military expenditures, but to the minds of most military students it can mean nothing in the way of increased efficiency or real economy. Rather the contrary. It must certainly add to the military confusion and postpone the day of true organization that will mean true efficiency and true economy.

WASHINGTON, D. C.

Wanderlust

BY WILLARD A. WATTLES

IN a Land of Faery I made my home
And sought to tarry the feet that roam;
I built me a hut on a sunny day
And plastered its walls with the river-clay;
I built thee strong, O heart of song,
Secure, I thought, from the world's red wrong;
The great trees whispered overhead
And green the clambering vines were spread
Where the crimson trumpets of the morn
Flared into triumph when Love was born.

But lure of the highway long and brown,
So surely, silently beckoning down
From the quiet hut to the noisy town
Along the banks where the river stayed
In eddying circles of light and shade,
Called to me, cried to me all night long
Till I kissed the sleeping lips of song;
Then I turned my face from the clay-walled
home
And followed the road that led my feet
To the clamoring throng on the busy street,

Where joyless lips that cannot sing
Are crushed in cruel silencing,
And hopeless ones who beg for bread,
Can never know when the trumpets red
Set fire to the green enseltered walls
Of a clay-built hut where the silence calls
Me back to the faery groves of home
By the restless surge of the river-
foam,
O hearts that tarry and feet that roam!
AMHERST, MASS.

THE MAYOR OF TOKYO

On February 24 the steamship "Awa Maru" left Yokohama bringing 3,000 young cherry trees to the United States. These trees are of the choicest species in all Japan, and are the gift of the municipality of Tokyo to the United States. They will be planted in Washington along some avenue as a memorial of national friendship between the two countries. Several years ago a similar shipment of trees were sent to this country, but our immigration authorities detected some suspicious disease among them and they were all destroyed. But the Mayor of Tokyo, the Honorable Yukio Ozaki, nothing daunted insisted on another set of trees being grown in specially prepared and disinfected soil. To the Mayor, therefore, belongs the credit of carrying to completion this graceful act of international courtesy. Mr. Ozaki is a liberal in politics. He is generally considered the greatest orator of Japan. Born in 1859, he graduated at Keiogijuku University and then went into politics, being elected a member of the first session of the Diet and continuing a member ever since. He was chief Councillor of the Foreign Office in 1897, was a member of the Matsukata Cabinet and Minister of Education in the Okuma Cabinet of 1898. He left Count Okuma's party, however, and joined Prince Ito's party and was made its leader in the House, but in 1903 he resigned to become a free lance, and was the same year elected Mayor of Tokyo.

Literature

Industrial History

AMERICAN industrial society is the creature of the last generation. Only since the Civil War have the forces of modern industry taken hold of American life and compelled the individual, the corporation, the State—even the nation—to fall in line and march in step with the pace set by transportation, manufacture and invention. In the earlier decades of American history agriculture explains everything, and their incipient manufactures are to be treated as exceptions to the general rule. Clay's American system, dealing with the status of industries that were strange to most of his followers, had a popularity in theory that it has lost as the masses of the population have come to feel the rigor of industrial control. But it was a long struggle, lasting half a century, before the class created by the industrial revolution came to feel its identity and realize its power.

John R. Commons is the unquestioned leader among those scholars who, blending economics and sociology and history, have sought to analyze the movement toward industrialism, to write its history and to chart its future. In the great work which he has now brought to completion* he has inspired a group of students to assemble the documentary fragments left in the rise of a labor class from its beginnings in inarticulate complaint, thru its period of incoherency, into its present state of vigorous though undisciplined maturity. His editorial comment, in his introductions to the various groups of volumes, goes far toward showing the real significance of the social movement.

We have already noted and commented upon the six volumes of the collection which have to do with the frontier, the plantation, and the genesis of the labor

movement in America. In the seventh and eighth volumes, the last-named movement becomes more definite and wider in its extent, while a new period of philosophy runs its course. Today, a century ago and in the middle of the last century have been the periods when social panaceas have been most thought about and tried. The economic faddists of the 40's, as Mr. Commons calls them, had a theoretic output in excess of their practical result, but for the first time the rights of labor, as such, came to be a matter of serious thought for men of intellect. The factory system was getting a foothold before the Civil War; with it came "Owenism," "Fourierism," "True Americanism" and "Free Soil," while the radicals looked ahead to the general acceptance of the ten-hour day.

The changes since the Civil War are recorded in the ninth and tenth volumes. Significantly enough, the National Labor Union, and the great all-American Knights of Labor and Patrons of Husbandry were the distinctive institutions. The new nationalism was accompanied by new philosophies that prove the crystallization of American life. The free land was gone; wage earners were always to remain wage earners; America had become industrialized. Whether the reformer found his cure in the control of the land, as did Henry George, or in the regulation of the job, as did the labor leaders, the movements and documents prove that a new nation had appeared.

None of the historians of the middle period of the last century has seen the significance of the movement whose footsteps have been followed here. Mr. Rhodes ignores it; Professor McMaster sees in it merely a group of interesting events; Von Holst, obsessed by the slavery struggle, did not know that it existed. Indeed, during the middle period the movement was only in its beginnings, and the cases which look so imposing here were scattered through a wide variety of more exciting affairs.

*A DOCUMENTARY HISTORY OF AMERICAN INDUSTRIAL SOCIETY. Edited by John R. Commons, Ulrich B. Phillips, Eugene A. Gilmore, Helen L. Sumner and John B. Andrews. Ten volumes and a supplementary volume. Cleveland: The Arthur H. Clark Company, 1909-1911. \$50.

But when the historian of the era since the Civil War shall approach his task he will find in these, and their related documents, his main theme. A new nation, industrialized and nationalized beyond recall, will be his subject; and his movements will have to do with the struggles of conscious classes to secure their reward, and of the body politic to maintain its rights and its existence. Mr. Commons and his coworkers have collected the materials and pointed the direction which our future history must take.

Songs in Various Keys

IN her songs of the woman spirit—*In Vivid Gardens*¹—Marguerite Wilkinson speaks a vigorous word, and sometimes a very plain word, for woman—for the ideal woman in her ideal perfection of physical form, mental sanity and pure motherhood—insisting at the same time on an equally pure manhood and self-sacrifice in the husband who shall stand with her at the altar. She is indeed the singer of the new woman who claims absolute equality with man—not the woman of the Elizabethan hothouse flowers lolling in the gardens of courts. She has no love for the passion flowers of some of the new-fledged poets. Hers is the old-time virility, in the primitive significance of that much-abused word—force, energy, power to do and to suffer. Her mission in the present volume is to redefine love, to restate the relation between man and woman. This she does in many poems of merit—notably in the poem called “The Answer,” and in the vigorous stanzas on “The Non-Conformist.” For a very musical summing up of the whole matter, one might with interest read “The Land of the Orange Flowers.”

Much less ambitious is Margaret E. Sangster, who, in *A Little Book of Homespun Verse*,² shows herself to be essentially the poet of home life, the workroom, the old-fashioned “settin’-room,” in which one is glad to have had a small chair by the fireside. Neither

in her heart nor in her song does she care for the airship ladies who seldom in their poetic ecstasies land one on the home-made rug. Her democracy is of the old style that mends clothes, sews on the buttons, and unostentatiously handles the knitting needles. She is quite in sympathy with the weak of all colors, and it is *con amore* that she takes the side of black “Mammy Nell” against the “pussons” born with a silver spoon in the mouth:

“If heaven’ll even things, my chile,
Dese lazy folks up dere
Will fine St. Peter settin’ ’em
To sweep de golden stair.”

If Mrs. Sangster is the poet of the home, Miss Kimball³ is the poet of the church. Seldom far from the arching portal, the baptismal font, always with the service book in hand, she carries into song an old fashion, dating as far back as George Herbert, yet not exactly suggesting Herbert in his quaintness of speech, in his humble familiarity with God, she yet arms herself far more than the New England mother cares to do with the rhetoric of the poet’s library, dealing far less with specific duty to the working mass than does Mrs. Sangster. She joins the rich processional of Sunday, and worships, even in her sympathetic songs of the seasons. Indeed, the full harvest in autumn, of yellow corn and the golden pumpkin arrayed in state at the agricultural fair, she loves to set to the melody of hymns:

“More fragrant than the meadow’s breath
The incense of our souls should rise
From life’s rude altars wreathed by Faith
With borrowed bloom from Paradise.”

Whittier could hardly do it better, so far as the rich and mellow verse goes, but Whittier would distinguish between Sunday and Monday.

A delightful sheaf of madrigals and other light verse with a decidedly Heineish tang is Jean Wright’s *An Urban Faun*.⁴ Mr. Louis Untermeyer’s *First Love*⁵ is a sequence of songs. With variations chiming with the varying moods of love—its hopes and dreams, its

¹IN VIVID GARDENS: SONGS OF THE WOMAN SPIRIT. By Marguerite Wilkinson (Marguerite Ogden Bigelow). Boston: Sherman, French & Co. \$1.

²A LITTLE BOOK OF HOMESPUN VERSE. By Margaret E. Sangster. New York: Sturgis & Walton Company. \$1.

³POEMS. By Harriet McEwen Kimball. Boston: Little, Brown & Co. \$1.50.

⁴AN URBAN FAUN AND OTHER POEMS. By Jean Wright. Boston: Richard G. Badger. The Gorham Press. \$1.

⁵FIRST LOVE: A LYRIC SEQUENCE. By Louis Untermeyer. Boston: Sherman, French & Co. \$1.

joy and despair, the lover yet loses himself and his reader in his frequent failure to keep the mind fixt on the mood rather than on the art. A poem of strong, sweet home life, with its temptations bravely run down to a glad ending, is Charles Hanson Towne's⁶ opening tale done in excellent blank verse of the Wordsworthian order, with the Wordsworthian simplicity of diction. Professor Scollard bestows his best finish of form and polish on his latest volume of verse, a series of exquisite vignettes in song, *From the Lips of the Sea*.⁷ From his lofty highland of daily work he takes us down to the shore, and he listens and we listen with him to the

"Song of summer by the sea,
Of half-forgotten runes made long ago
Of moon-wrought marvel and of mystery,
Of glamor—of the glow and after-glow."

Our inland waters are the theme of John C. Wright. In his *Lays of the Lakes*⁸ the lover of verse finds a pleasing strain from the midland forests and the wild life of the West, and more especially from the sheen of the Great Lakes. This last, he says,

"Is the place where I love to be,
Sailing, sailing, sailing along,
Sailing and singing a sailing song,"

and so say we all of us in certain moods of the day, but it isn't always in the day's work.

Much deeper is the thought in the poems of Carlos Wuppermann's *Quiet Places*⁹. Tho not dramatic in form, the passion of drama is there, the general theme being the exorcism of the uninvited ghosts that flock in the rear of an unbidden love.

A volume of meditative verse, by Benjamin R. C. Low, is *The Sailor Who Has Sailed and Other Poems*.¹⁰ The sailor who has sailed has ventured on the old sea of doubt, of unsolved riddles in the moral world, of faith thinly supported against a sea of evil. The verse is good in quality, the blank verse particularly successful in form, evenness and

music, and quite engaging in its antique simplicity. Pretty love songs lie scattered among the group of "Other Songs"—notably one on "Penelope," reminiscent of the story of Ulysses.

Grace Denio Litchfield runs back in *The Nun of Kent*¹¹ to the days of Henry VIII to find her theme, and catches a heroine at the door of Canterbury Cathedral. The pious girl is another Joan of Arc, having a priestly inspiration to dethrone the amorous monarch and substitute Mary, his daughter, on the throne of England. We are permitted to see the machinery by which saints were made and run in those days. The study of the priest at his hilarious devotions, the play of character among a group of them, give the dramatic element, the true plot. Elizabeth, the nun of Kent, sainted against her will, the lover Cuthbert, and his keen-eyed mother, Mistress Vane, are sharply drawn, with no waste of words—drawn with the strength and weaknesses, the same in those old days as now; but, as the halo of saintship rests awkwardly on the fragile girl, so the pomp of the Shakespearean style fails to adjust itself comfortably to the simple girlish peasant as she goes to her death from the prison in the last act, where she has not the advantage of the monk's rhetoric. She might be left to go to the scaffold with a noble heroism, but not with the heroics of a noble born in the purple. This, perhaps, is the flaw in the drama, which, however, is far too good to be set aside in the company of unsuccessful dramatists.

The *Vista of English Verse*,¹² by Henry S. Pancoast, is a reprint of an old collection, with additions and changes. Its scope, broader than that of the beautiful "Golden Treasury" of Professor Palgrave, accounts probably for the omission of many lyrics of greater merit than some of those included in the volume. Palgrave, for instance, finds forty-one lyrical pieces of the first class culled from the minor poems of Wordsworth. Every lover of poetry would accept them as worthy of a high place at the marriage feast of the lyre and song. Mr. Pancoast

finds room for only eighteen; yet one need not complain. Enlargement of scope necessitates some repression in selection. Allowing for this and for difference of taste in the general reader, the revised volume should be welcomed as a serviceable gift to American lovers of song.

A History of the President's Cabinet. By Mary L. Hinsdale, Ph. D. Pp. 355. University of Michigan Historical Studies. Ann Arbor: George Wahr. \$1.75.

The American Cabinet occupies a peculiar—and perhaps transitional—place as the subordinate of the President and the subordinate of Congress; and writers have done little more than consider it in one or the other of these relationships. Miss Hinsdale's careful study, which goes back to the origin of the Cabinet and comes down to the appointment of Mr. Fisher and Mr. Stimson, breaks virgin soil. For the first time the subject is considered comprehensively as a thing by itself. The facts are arranged conveniently for reference, an historical survey being followed by chapters on relations with the President and Congress, and on the principles of Cabinet choosing. The style, tho good, is a little compact for the general reader; and space has been limited so severely—ten or twelve pages to each Administration—that the personal rivalries and political maneuvers which enlivened such times as those of "Jackson, Lewis & Co." have been left without much notice. While accurate in presenting details, Miss Hinsdale does not always show an open mind or sure judgment in her treatment of large questions. She seems a little too well pleased with our system of completely isolating the Executive from Congress. Criticism of it she considers academic, thus overlooking the wastefulness of our financial procedure, as demonstrated by Mr. Tawney and Senator Aldrich, and the arguments which so practical and experienced a Representative as Mr. McCall recently urged in favor of seating the Secretaries in Congress. Miss Hinsdale refuses to see the modifications which are being made in the theory of separate powers. Few competent observers are likely to agree with her that the initiative of the Administration is not increasing.

Chemical Phenomena In Life. By Frederick Czapek, Ph. D. New York: Harper & Bros. 75 cents.

Science deserves a broader constituency than the classroom, and this is especially true when a field of knowledge is being developed for the first time. This admirable little manual takes a broad survey of the field of the chemistry of life, from colloidal chemistry to the physical basis of heredity, including such topics as the new science of "immunochemistry," or the chemical and biological causes of the phenomenon of resistance to disease, including the whole question of the anti-toxins. In fact, the author claims all vital phenomena for his province, as he says: "What we call life is nothing else but a complex of innumerable chemical reactions in the living substance which we call protoplasm." Like the other volumes of "Harper's Library of Living Thought," this is very serviceable to the general reader who wants to "catch up" with the advance of knowledge.

Literary Notes

....A story of hereditary eccentricity, verging on insanity is effectively told by Evelyn St. Leger in *The Shape of the World* (Putnam; \$1.25). The wife of the tyrannical husband possesses both charm and strength of character, an unusual combination in heroines nowadays.

....The author of "When It Was Dark," Guy Thorne, has written a realistic and lurid study of the heredity of drunkenness. (*The Drunkard*. Sturgis & Walton; \$1.35.) He proposes two solutions of the evil: for the protection of society, forbidding the drunkard to marry; for the individual, the care of the Church.

....The story of the life of Mrs. Harriet Caswell Broad, missionary to the Indians, editor and Home Missionary Secretary, is told by her brother, Dr. Joseph B. Clark, in an attractive volume entitled *Blue Sky* (Pilgrim Press), which was a name bestowed upon Mrs. Broad by the Indians of the Cattaraugus Reservation, and used by her frequently in later life as a pen-name.

....Almost everybody knows what a *Black Cat* story is. Everybody who does know, knows also whether he likes them or not. If he does like them he will be glad to know that he can find a whole bunch of them together in H. D. Umbstaetter's *Red-hot Dollar* (Page; \$1). They all start off on the run at

the crack of the pistol and the susceptible reader feels his head swim or his flesh creep on the third or fourth page.

....Dean George Hodges is a prolific contributor to popular literature on religion, and sometimes his resources, large as they are, prove unequal to the demands he makes upon them, and the products of his pen fail to reach the usual high standard of excellence. *Everyman's Religion* (Macmillan; \$1.50) has some good thought in its various essays, but much of the matter is little more than padding.

....In the *Mystics of the Renaissance* (Putnam) Dr. Rudolph Steiner gives an exposition of the lives and religious experience of such men as Eckhart, Tauler and Boehme, particularly in their relation to modern thought. Dr. Steiner believes that these men, were they living today, would be in the forefront of the scientific and naturalistic movement, since they were merely with mistaken facts following the mandate: "Know thyself."

....We reviewed *The Quest*, by Dr. Fredrick van Eeden, in our issue of July 11, 1909, when it was first translated from the Dutch into English, and we are glad to welcome a new edition of it published by Mitchell Kennerley (\$1.50), for it is an unusual novel, a strange mixture of mysticism and muckraking, the struggle of sordid realism with a quaint idealism. The dream life of little Johannes is more vivid and interesting than his everyday experiences.

....From Paris comes news that a Bernard Shaw season is looked for this spring, and Mr. Shaw is expected to visit Paris as the guest of the municipality during the year. Meanwhile, not only is the publication of a French translation of certain of his plays announced for March, but already the Théâtre des Arts has in active rehearsal "Widowers' Houses," which will be produced under the title "L'Argent n'a pas d'Odeur." It is reported that a translation of "Arms and the Man" will be played at the Odéon early this year.

....Walt Whitman is an author whom most of us—those of us, at least, who are not uncritical enthusiasts—like best in small doses. He is a tonic, indeed; but who has not felt that his was a case for the anthologist? An altogether discriminating anthologist has declared himself in the person of Waldo R. Browne, who has collected in *The Rolling Earth* "outdoor scenes and thoughts from the writings" of the Good Grey Poet. John Burroughs contributes an introduction, and Houghton Mifflin Co. have given the little volume beauty and simplicity of form (pp. 221; \$1.25). Whitman poet and Whitman diarist are both most happily represented.

....The latest addition to the already long and still lengthening list of books on harmony (let us qualify this by saying the latest that has been sent to us) is by William Alfred White and is entitled *Harmonic Part Writing* (Boston: Silver, Burdett & Co.; \$1.50). With singleness of purpose the author aims to give a mastery of composition for four parts, whether vocal or instrumental, and he says some illuminating and helpful things on this theme which is the foundation of all modern musical composition.

....*The New Dictionary of Statistics*, edited by August D. Webb (Dutton; \$7), is a large volume of nearly 700 pages designed to complement the fourth edition of "Mulhall." The contents, alphabetically arranged, cover a wide range, cost of living, vital statistics, commerce, pensions, pauperism, shipping, crime, agriculture, etc., in all countries. The only drawbacks to its use in this country are that the census figures of 1910 are not included and all financial matters are given in pounds sterling instead of dollars.

....Neither the title nor, at first thought, the plan of *The Ben Greet Shakespeare*, for Young Readers and Amateur Players, arouses our enthusiasm, for tho "the plays are cut to the length of an ordinary performance," the improvement is more than doubtful unless an acting version and nothing else is aimed at. Certainly the hints for amateur players are good so far as they go. The two volumes which we have received are *The Tempest* and *A Midsummer Night's Dream*—attractively made by Doubleday, Page & Co., and published at sixty cents each.

....The new art of cinematography, which is capable of doing as much for the drama as printing did for literature, has several periodicals devoted to it, but the first book to give a comprehensive account of its processes and results is *Moving Pictures*, by Frederick A. Talbot (Lippincott; \$1.50). Tho written from the English point of view it does justice to the part played by America in the development of the art. The different forms of apparatus are described in sufficient detail for the general reader and numerous illustrations given of its varied applications. A good book for reading rooms and school libraries

....Mrs. Gilman's pen seldom does better service than when it pricks some bubble of perverse tradition. In *The Crux* she transplants four New England women to Denver and sets them to home-making for lonely bachelors in an ideal boarding house. Reforming a dissolute man by marrying him to a clean-minded girl is the sort of respectable social crime that needs illuminating, and Mrs. Gilman does it harshly but with exemplary thoroughness. *Moving the Mountain*, by the same

author (The Charlton Co.; \$1 each), is less happily carried out. The transformation the book declares accomplished in thirty short years, would take as many centuries to bring about. Mrs. Gilman modestly calls her new world, recreated in one generation, "a baby Utopia," but it is like all the rest of them, from Plato's to Bellamy's, except for its mushroom growth and the greater dominance of women in its idyllic affairs, and like the rest it is savorless.

....The author of "The Heritage of the Desert," Zane Grey, has brought out a new novel, *Riders of the Purple Sage*, that has the rush and sense of adventure only slightly hinted by the title. It is a story of the struggle between Mormons and Gentiles in Utah, when the latter were few, in wild territory days. The heroine is a Mormon woman and the hero the sworn enemy of her people, a situation that makes for romance. (Harpers, \$1.30.)

....Dr. James J. Walsh, of Fordham University, continues his studies of medieval medicine in a volume entitled *Old Time Makers of Medicine*. (Fordham University Press, N. Y.; \$2). The author begins with chapters on the Jewish and Arabian physicians, but he is especially interested in the achievements of the Catholic physicians which give support to his thesis that the Church was not inimical to scientific progress. The volume will interest laymen as well as doctors, for it brings together in convenient form material hitherto inaccessible to the ordinary reader. The chapters on medieval dentistry and women physicians will be a surprise to many.

....Benjamin C. Marsh, a social worker whose experience in charity organization, the Society to Protect Children from Cruelty, and as a New York State Commissioner on Distribution of Population, has given him many opportunities for study and observation, has published a pamphlet of more than one hundred pages entitled *Taxation of Land Values in American Cities: The Next Step in Exterminating Poverty* (320 Broadway, New York). The excuse for his book Mr. Marsh finds in

"the failure adequately to tax land values, and the increasing budgets of cities, counties, States and the Federal Government, while, simultaneously, these political units are piling up millions of bonded indebtedness."

The investigator includes a statement of the sources of municipal revenue abroad, and a chapter on possible methods of taxing land values in our own cities. "The conclusion that a higher annual tax-rate on land values and a small land increment tax are the most feasible methods of reducing ground rents and securing an adequate revenue . . . will probably be generally accepted."

Pebbles

IF it is between Taft and Roosevelt we are for the survival of the fattest.

KENTUCKY is the State where they have poor feud laws.—*Philadelphia Inquirer*.

KNICKER—Did your father give you an auto?

Bocker—Yes, but he didn't endow it.—*Lippincott's*.

"I THINK," said Mrs. Cumrox, who was arranging a musical program, "that we will have a mezzo-soprano."

"All right," replied her husband. "Don't bother me about it. Go ahead and see an architect."—*Washington Star*.

IT was at one of the famous "frolics" given by the Lambs. Mr. Charles Frohman had made an extremely neat and appropriate speech. There was loud applause at its finish, and then, "Author! Author!" cried Mr. Augustus Thomas, standing up on his chair.—*Argonaut*.

THE new millionaire's banquet table was spread, and the guests about to be summoned. "Are you sure there are no reporters present?" anxiously asked the host of the butler.

"I've made certain of it, sir."

"Then go out and get a few," rejoined the host.—*Canadian Courier*.

CLERK—Can you let me off tomorrow afternoon? My wife wants me to go shopping with her.

Employer—Certainly not. We are much too busy.

Clerk—Thank you very much, sir. You are very kind!—*London Opinion*.

HIS FAILING.

He has never tasted 'baccy,
He is always temperate,
He is never rude or quarrelsome,
And he never comes home late;
In all ways he is a model
With this one dissenting "Nix";
On the street car, going homeward
He WILL talk politics.

His rating is unquestioned
As a model sort of hub;
He's the glittering example
In the office and the club;
But when he hits the street car
At just seventeen to six
His goodness is forgotten—
For he WILL talk politics.

He is good for blocks on iron,
And for miles on Schedule K;
He will ride beyond his corner
And talk back the other way;
It matters not the subject,
Be it lead or tin or bricks;
It's a mania most distressing,
For he WILL talk politics.
—*Denver Republican*.

The Independent

Entered at New York Post Office as Second Class Matter

Publisher, Clarence W. Bowen

130 Fulton Street - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, \$3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The Outcome of the Peace Treaties

LAST week we express our deep sense of humiliation that the Senate of the United States mutilated the peace treaties with England and France. By insisting on the amendments, the Senate narrowed the scope of the treaties and may have rendered them unacceptable to England and France. This week we propose to analyze the amendments more in detail, and then to offer some constructive suggestions.

The Senate in its amendments committed two sins—one of omission, the other of commission. The sin of omission consisted in striking out paragraph 3 of Article III, which gave the Joint High Commission power to decide whether the dispute is "justiciable" or not, and therefore to be arbitrated. Instead of the commission deciding this, it will now be decided jointly by the President and Senate, and as they have both agreed, by the first article of the treaty, to refer "all differences" to arbitration that are "justiciable," it follows that the Senate as well as the President will be morally bound to arbitrate every "justiciable" question. In other respects

the Joint High Commission remains as before the amendment. It consists of three nationals of each party. It has full power to investigate a dispute upon the request of either party, and if either party so desires its findings shall be postponed a year, thus affording time for ill feeling and passion to cool. It is safe to say, therefore, that the findings of such a commission, even if not legally binding, will have all the force of a legal decision. It will be hardly conceivable that a nation would fail to heed its recommendations. The amendment of the Senate, therefore, respecting the Joint High Commission is only a theoretical calamity. Practically it will hardly affect the course of international justice.

The Senate's sin of commission was the amendment we published in full last week, reserving from arbitration certain questions, including the admission of aliens, foreigners' rights to enter schools, State bonds, territorial integrity of the several States, and the Monroe Doctrine.

All these exceptions seem to be excluded from arbitration within the original terms of the treaty. If, however, this is not the case, it is inconceivable that England or France would desire to bring any of them into court, so their incorporation into the treaty would seem to be as harmless as it is superfluous. However, there is an aspect of the case that looks more serious, which has received no public attention. Do the American people realize that if these treaties are adopted as amended and become the supreme law of the land, the President and Senate may be guilty of settling grave questions of our constitutional law by the dangerous method of establishing precedents in regard to them in foreign treaties?

Take, for instance, "the admission of aliens to the educational institutions of the several States." Here is the implication, which is hardly less than a confession, put into a foreign treaty, that the United States has no authority over the matter where a State is concerned. That is a very serious admission, for the Constitution distinctly makes treaties paramount to State laws and constitutions, and more than once has the President called on Congress to enact needed laws in protection of aliens discriminated

against or injured under State authority. A treaty is no place to hamper by precedent our free action under our Constitution.

As much may be said as to the exclusion of "the question of the alleged indebtedness or moneyed obligation of any State of the United States." That means the repudiated indebtedness of certain States. But apart from the fact that these repudiated debts are already excluded under the language which makes the treaty refer solely to "all differences *hereafter* arising," it is not proper for us in a treaty thus to settle or even suggest it as a principle that Congress has no right under our Constitution to act on the matter by treaty. It plainly has such right.

In the same way the excluded question of "the territorial integrity of the several States or of the United States" is one that comes fully within the authority of the national Government, under the Constitution, and more than once such a question has been settled thru an international commission.

We therefore decline, as we did last week, to advise President Taft whether he should attempt to get England and France to accept the treaties as amended, or to pigeonhole them till after the campaign, in the hope that an aroused and renewed public opinion will force the Senate to yield.

Now as to positive recommendations.

1. There may be a question of courtesy to the Senate involved, and there would be but for a very serious question yet remaining as to the conditions under which the action of the Senate was taken; but if such courtesy will allow, the President should negotiate an arbitration treaty of unlimited scope at once with Germany. It is an open secret that Germany has felt aggrieved that we entered into negotiations with England and France before we did with her. She is now anxious to join with us in a peace treaty. Congressman Richard Bartholdt, president of the American group of the Interparliamentary Union, in a letter dated January 12 to Dr. Ernst Richard, president of the German-American Peace Society, quoted the German Ambassador as declaring . . . "that he officially informed the Secretary of State of Germany's readiness to enter upon

the arbitration policy, and that he had added that Germany was willing to go still farther than England and France and was ready to have all questions without distinction settled by arbitration."

This is a profoundly significant statement from Germany, as Germany has generally been considered up to the present time the chief obstacle to the progress of the peace movement of the world. As President Taft has repeatedly committed himself to the proposition that all questions—even those supposed to involve national honor and vital interests—are susceptible of arbitration, and as the majority report of the Committee on Foreign Relations of the Senate, which condemned the treaties with England and France as originally negotiated, said the Senate would have not the slightest objection to passing a treaty which confined itself to stating that "all differences" should be submitted to arbitration that are "justiciable," let the President, therefore, test their sincerity. Let him negotiate with Germany a model arbitration treaty of unlimited scope and without qualification. He believes in it. Germany says she will accept it. Perhaps the Senate will not again take the responsibility of thwarting the ends of justice and civilization. Moreover, the peace sentiment that is now so strong thruout the country will be able to make itself felt better the next time.

2. Let the President appoint forthwith the Peace Commission created by the following joint resolution of Congress in the spring of 1910:

"Resolved, etc., That a commission of five members be appointed by the President of the United States to consider the expediency of utilizing existing international agencies for the purpose of limiting the armaments of the nations of the world by international agreement, and of constituting the combined navies of the world an international force for the preservation of universal peace, and to consider and report upon any other means to diminish the expenditures of governments for military purposes and to lessen the probabilities of war."

This resolution was introduced by the World Federation League of New York and jointly supported by the New York Peace Society and the World Peace Foundation of Boston. It has since been indorsed by the Interparliamentary Union at its Brussels session, the International Peace Congress at Christiania,

the New England Peace Congress, the Mohonk Arbitration Conference, and the American Peace Congress. President Taft in his annual message to Congress, dated December 16, 1910, stated:

"I have not as yet made appointments to this commission because I have invited and am awaiting the expressions of foreign governments as to their willingness to cooperate with us in the appointment of a similar commission or representatives who would meet with our commission and by joint action seek to make their work effective."

The American Peace Congress, in its resolutions in reply to this, stated:

"This Congress understands this commission to be a purely American commission not endowed with diplomatic functions, and entertains the conviction that the commission should be appointed at an early day and should begin its labors without regard to the opinion which other powers may entertain as to possible results."

We think recent events show the need of a body of experts at the call of the Government to make a scientific study of the whole peace problem. Surely Congress will extend the time in which the commission can report, and also appropriate sufficient funds for the prosecution of the commission's duties. This commission is a direct outcome of the request of both Hague conferences that the nations make a deliberate and official study of the whole peace question, so that they would come to the Third Hague Conference in 1915 better prepared than they were in 1899 and 1907. The President has been badly advised in not appointing this commission. It can do no harm, for its findings do not have to be adopted, and it is likely to do much good. Moreover, it is doubtful whether the President has any right to ignore and nullify a mandatory joint resolution of Congress.

3. The President and the Republican leaders should see that a plank is put in the platform of the party at the forthcoming Chicago convention pledging the party to an enactment of genuine, all-inclusive arbitration treaties with other nations which may be similarly disposed. This will be popular with the voters, who are beginning to realize that this great peace issue is as predominantly moral as political. Moreover, it will bind the party and tend to prevent recalcitrant Senators from backsliding when the test

comes. Such a plank would greatly strengthen Mr. Taft before the country and would be an evidence of genuine statesmanship.

To recapitulate, then, we advise President Taft to go slow about seeking to get France and England to ratify the amended treaties, until he has convinced himself he is not thereby signing away to the several States power vested in the Federal Government. On the other hand, let him proceed at once to test the Senate's sincerity by negotiating a model and all-inclusive arbitration treaty with Germany. In the meantime the members of the Peace Commission should be appointed and set to work, and steps taken to commit the Republican party at its next convention to unlimited arbitration.

A Mischievous Decision

WE have heard much of the delays of the law; we now have from the Supreme Court of the United States a surprising example of the mischief, not to say tyranny, of the law.

A patent is in its very nature a monopoly. It is intended to be such. It is made a monopoly so that for seventeen years an inventor may receive a proper reward for the benefit he does to the world. The law used to allow a patent to have a term of fourteen years, and then to be renewable for fourteen years more. This excluded the public too long from the free advantages of an invention, and the law was changed to make the patent good for seventeen years and no more. One such patent is that on the mimeograph, used in offices for making a number of copies of a letter or document. The company which manufactures it puts into the printed slip attached to the sale the provision that the purchaser must use with it only the ink, paper and appliances which the company supplies. The assumption is that only that ink will work with the mimeograph, and that the use of any other ink will give poor results and will discredit the machine. The ink or paper is not patented and evidently cannot be. Now, a purchaser of the mimeograph purchased other ink much cheaper, to the loss to the company by the failure to purchase their unpat-

ented ink; and the company brought suit against the seller of the ink for damages, thru contributory infringement of the patent. The case went up to the Supreme Court of the United States, and by a divided court, four against three, the company's suit was sustained. It was decided that the patent had been infringed by the use of an unpatented article.

The Supreme Court, when full, consists of nine members. But Justice Harlan has died, and his place was not filled, and Justice Day did not sit on account of absence caused by a death. Four members believed that the patent law, as formulated, gave the patentee the right to dictate what unpatented appliance should be used with his invention, or whatever other conditions of sale or use might be imposed on the buyer, while three interpreted the law otherwise, and in the interest not of the monopoly, but of the people. Four is not a majority of the full court, and in a full court the decision might be reversed. That the Administration, which is prosecuting other monopolies, will find a way to seek a reversal of so strange a decision we do not doubt; or, beyond question, Congress will amend the law to prevent such legal injustice.

For this decision can work monstrous injustice never intended under the law. A safety razor has knives that must be sharpened, and the company that sells it may require that when dull, new knives shall be purchased and the old ones not sharpened elsewhere. The makers of a patented article may bring suit against a department store if it sells a patented article at a price less than that dictated by the makers, or a copyrighted book at less than a dictated price. Such a company as the United Shoe Machinery Company, capitalized at many millions of dollars, and which increases the price of every pair of shoes by perhaps half a dollar, will profit by this decision, for it requires the use of its unpatented buttons and fastenings. It would not be difficult to argue that a newly invented washing machine must be used with only one sort of soap, or a flat iron with one brand of starch, or a stove with one sort of coal or kettle. The principle is the same.

To the non-legal mind, the mind not trained to study quibbles of words, such an interpretation of law seems absurd, and we regret that it will tend to discredit judges and courts. The advocates of the recall of judges will use it with force. Because Mr. Roosevelt has lately supported the recall of judges it will be used in his behalf. We cannot help believing it bad law, surprisingly bad; but the remedy is not to abuse the judges, but to amend the law, so that no such absurd interpretation shall be possible. Or even a better way is first to present the case before a full bench, in hope of a reversal, which would avoid a further long period of litigation under a new law. The old law ought to be reinterpreted by our highest court "reasonably," a useful word, and long familiar to the law, and lately used with effect in interpretation. If ever a court can import the word *reasonable* into its decision as to a law this is a case, when the decision if generally applied will create intolerable monopolies.

Church Union for China

WE recall the time when missionaries in the foreign field wanted to unite, but the societies at home objected. Now the boards at home are as eager for union as are the men and churches abroad. Particularly is there a call for union in the new China, where there is a marvelous field for growth if the Chinese can see a union of at least the Protestant forces.

At the late meeting in this city of the representatives of the foreign mission boards of the United States and Canada, Dr. James A. Barton, secretary of the American Board, presented the need of union, particularly for China, in a remarkable address, asking for a common name for all the Chinese congregations and the submerging of all denominational differences before the Chinese people. He would have common literature, schools simply Christian, and even theological seminaries merged. He then argued in favor of putting in the hands of the Chinese churches, missionaries and natives the entire control of the scope and management of their common activities, assigning to each American

society the field to which it should give aid. The question of creed he did not believe need give any difficulty. The proposition was, in principle, approved by the conference and a committee appointed to arrange the details. This shows how near we are coming to Church union, and that differences of polity between denominations which have adopted episcopal, presbyterian and congregational styles of government are held of less importance than of old. With such union abroad it would not be strange to see the Chinese very soon coming over to the Christian faith by the tens of millions. But then why keep up the separation at home?

An admirable example of such union and native control is set by the Young Men's Christian Association abroad. We take as an example that in China. At Foochow, one of the largest cities in China, and a center of the new republican uprising, a building is being erected for a Young Men's Christian Association, and the directors are Chinese. A letter tells us what kind of men they are. The president of the board is Mr. Wong, the most eloquent man in the province, who has been put at the head of the Board of Ports and Communications for the new republic. Another is Mr. Ding, President of the Board of Foreign Affairs. The vice-president of the association is also Vice-President of the Board of Foreign Affairs, and one of the two representatives of the province at the constitutional convention. Two others are on the Board of Finance. In all, six of the directors have prominent positions on the boards of the new government. The correspondent writes:

One cannot fail to be in sympathy with a movement in which such men as these have replaced the old inefficient and corrupt officials. These men are serving on very small salaries and some of them at very considerable sacrifice. It is interesting to note that the spirit of democracy predominates. I asked Mr. Cio, our Chinese secretary, whether I should call the President of the Board "Daren" or "Honorable," as officials have always been called. "No," he insisted, "only Mr." There are no official robes, no peacock feathers, no elaborate etiquette, but true Jeffersonian simplicity.

Our friend concludes with a description of a public service in honor of two

students who had been killed in the revolution. It was not a Christian service, and yet no suggestion of idolatry appeared, and one of the speakers declared that Christianity was the only basis for a free and enlightened country. There was an elaborate program, with speeches, music and military; and few queues were to be seen. After the men spoke there were addresses by half a dozen women, beginning with the wife of the President of the Cabinet, who told how she and her husband had planned the capture of the city. All spoke with the most fervid patriotism, when the Chinese have been said to lack patriotism, and declared the undying determination of the people to rule their own affairs. This was two months ago, and we see how now they have achieved their will for a united republic of China. Why not a united church?

The Trust Problem

WE find Mr. Roosevelt's remarks about the control and regulation of Trust combinations much more satisfactory than his speeches and written arguments in favor of the recall and reversal of court decisions by a majority vote at the polls. Last week he published his views about the regulation of combinations. We are glad to commend them, as we did four months ago (November 23) when he made them known in his statement concerning the purchase of the Tennessee Coal and Iron Company by the Steel Corporation. He said then, as he says now, that our aim should be "to control business, not to strangle it," that we should conserve ideas, efficiency and "up-to-date" methods, just as we conserve our natural resources. He would have the Sherman law amended by the addition of a definition of offenses, and he would have the work of regulation done by an executive commission. For a long time THE INDEPENDENT has held that the Trust problem can be solved in this way. Mr. Roosevelt knows, we presume, that his policy with respect to this subject is substantially that of Mr. Taft, President of the United States.

Our business men, Mr. Roosevelt says, "must be told in plain English what they can and what they cannot do":

"Once given an accurate chart, they will speedily conquer the commerce of the world. But at present Germany has this accurate chart and we have not; and it is hard to overstate what this fact means in the way of handicap to us and of advantage to Germany."

If he means that our chart should be like Germany's, we must enter a protest. Our Government and laws never should and never will sanction the sale of a combination's products for export at prices far below those which at the same time the combination is authorized or permitted to exact from domestic consumers. With respect to this detail Mr. Roosevelt and Mr. Taft are at variance. "My chief concern," says the ex-President in words immediately following those we have quoted, "is with the welfare of the little man, but of course we must do justice to all." This being so, we must assume that he is not really in favor of the German chart. He goes on to say that when business men "come to make necessary trade agreements they are puzzled lest they may find that they have unwittingly transgressed the law," and that they cannot find out in advance what the law is:

"This is all wrong. There should be absolute clearness of the law, and there should be a competent administrative body to do for the world of industrial production what the Interstate Commerce Commission has done for the world of transportation. It should be the policy of the Government clearly to define and punish wrongdoing, to give in advance full information to every man just what he can and just what he cannot legally do."

And he adds that "mere size" should not be made criminal; that the regulation of large corporations cannot be accomplished by a prohibition of all combinations, and that the evils of monopoly cannot be removed by a succession of lawsuits. In substance, much of this is what Secretary Nagel has repeatedly said in public addresses. Heretofore we have referred to his opinions. At Springfield, Mass., on the 13th inst., in the course of an argument for the protection and regulation of national business by national authority, Mr. Nagel said:

"Today our commercial organizations must go before the United States courts to find out what they can do, and must submit their plans for reorganization and readjustment to the courts. This work should not be put upon the courts, whose duties are interpretive. They should not be asked to go into the details of examining plans for the conduct of a business

to see if these are wholly within the scope of the law. The corporations should have the right to go before some administrative body, submit their plans for the conduct of business, and go on with accredited policies. Today we have only one body that really can issue a charter for national business, and that is the United States court. There is no other tribunal before which any large enterprise can lay its plans. The condition of the law tends to paralyze enterprise and industry."

Mr. Roosevelt remarks that the people must solve the problem by insisting upon efficient control. "Let our opponents of reactionary habit make no mistake. Our opponents believe that the people cannot be trusted. We believe that they can be."

Now let us see what Mr. Taft has said on this subject. In a message about Trusts, sent to Congress in the first week of December last, we find him admitting the need of supplementing the Sherman act by specific prohibitions which will "point out more in detail to the business community what must be avoided." He would have the law specifically forbid

"the attempt and purpose to suppress a competitor by underselling him at a price so unprofitable as to drive him out of business, or the making of exclusive contracts with customers under which they are required to give up association with other manufacturers, and numerous kindred methods for stifling competition and effecting monopoly."

Asking, as President Roosevelt had done, that provision be made for the Federal incorporation of companies engaged in interstate business, he recommended that an Interstate Trade Commission be created, and that there should be a new statute "permitting and aiding the formation of combinations of capital into Federal corporations":

"They should be subject to rigid rules as to their organization and procedure, including effective publicity, and to the closest supervision as to the issues of stock and bonds by an *executive bureau or commission* in the Department of Commerce and Labor, to which in times of doubt they might well submit their plans for future business. . . . Such a bureau or commission might well be invested also with the duty of aiding courts in the dissolution and re-creation of Trusts within the law. It should be an *executive tribunal of the dignity and power of the Comptroller of the Currency or the Interstate Commerce Commission*, which now exercise supervisory power over important classes of corporations under Federal regulation."

It appears, then, that so far as amendment of the Sherman act and regulation

of Trusts by an executive commission are concerned, President Taft is a Progressive whom Mr. Roosevelt should warmly commend. His efforts to procure legislation for making his policy effective deserve Mr. Roosevelt's recognition and support.

The People's Prayer

THE New England Governors used to appoint days of fasting and prayer. Another sort of prayer day is coming into vogue, and March 18 was an illustration. The agricultural papers of the country, which are unanimously in favor of parcels post service, selected that day for a united appeal of their subscribers to their Congressmen for the immediate passage of an efficient parcels post bill.

A gradual alignment of forces on this subject has been taking place, and it is as emphatic on one side as it is on the other. The commercial sentiment of the open country has crystallized into opposition to any and every form of this sort of service by the Government. It has become a wide conviction among country merchants that a large part of their business would be taken away from them by the post, and would be turned over to the large mail order houses in the cities. It is of no use to discuss with them. The argument on the other side is the same that it has been, that credit business must inevitably remain with the country merchant; that the farmer will send to his local dealer for all articles immediately needed; all the difference being that his purchases will be carried to him by post, instead of himself being compelled to visit the store. Those who have not studied the question with some care can have no idea of the amount of time that the farmer loses in the course of a year for lack of some service of the kind—besides the wear and tear of his team.

The argument is just as strong as Nature can make it in favor of parcels post on the side of the farmer. Every one that lives any distance from purchasing stations is committed to the new proposition. The average farmer lives three or more miles from his depot, and his store and his post office. It was this fact that brought about the rural free mail

delivery. Many of them are obliged to go ten to fifteen miles; and this must be done whenever there is a breakage of some important tool, or a need of some important article at the druggist or dry goods store or hardware. Then there is the miller to reach; and altogether the farmer loses one day out of every six working days. The delivery of his mail has relieved him greatly, and at the same time put a check to the tendency to keep him isolated in spirit. Free mail delivery has put him directly in alignment with the world's progress, and we can no longer think of country life as remote or isolated. Now these country homes demand of the Government, that is they demand of themselves, an extension of co-operation, to enable them to save a lost day in the week. Parcels post is a public measure for the public welfare, and it is held to deserve the commendation of every good citizen.

Remember that all that is now proposed is an enlargement of the system which has been in operation for many years. Our post office system has carried to twenty-nine other countries, and all the citizens of those countries, eleven pounds in weight for twelve cents a pound. It hardly seems necessary to argue a proposition that would simply give this same service to our own citizens. Yet the opponents of the measure are willing that every American citizen shall pay sixteen cents a pound, whatever may be the distance carried, for whatever is carried, while the service shall be limited to about one-third the weight that is transported for foreigners. We have already yielded to this logic enough to give to the scattered agricultural people mail privileges equal to those afforded the residents of cities; to extend this to cover a reasonable parcels post is not considered granting a favor, but yielding a right. The demand is that the Government shall cease to discriminate against American citizens.

March 18 will stand as the inauguration of a new sort of co-operation; a prayer day in which petitions are delivered to Congress instead of the Lord. It remains to be seen whether these prayers will be heeded, but we imagine that in the stress of political affairs our states-

men will hardly find it safe to overlook this country sentiment, expressed emphatically in country prayers. As one of our rural contemporaries says: "The plan is to have several million letters reach Washington—all bearing that date. We all know that we want parcels post, and why we want it. The time for argument has gone by."

The Two Colonels Once More

A request comes to THE INDEPENDENT from the Columbia (S. C.) *State*, a journal of much intelligence and influence, to which it is only courteous to pay attention. Our readers will recall that Colonel Watterson reported the interview at which he was the third party between Colonel Harvey and Governor Wilson, in which the Governor told the Colonel that the latter's unfortunate support of him was doing his candidacy more harm than good, with the result that Colonel Harvey took down the Governor's name from the columns of *Harper's Weekly*; and so offended was Colonel Watterson with what he regarded as Governor Wilson's coldly heartless manner that he publicly denounced him. Thereupon subsequent correspondence between the Governor and Colonel Harvey was published, in which the former made full apology for such offense as he had given to his supporter, and Colonel Harvey courteously accepted it. But this left Colonel Watterson in the position of one who had in his anger made public what was a confidential interview, and now Mr. Gonzales, the well-known editor of our Columbia contemporary, who believes that Colonel Watterson had made the interview public at the request of Colonel Harvey, takes advantage of our suggestion that the letters between the two Colonel editors be published, to offer this challenge and appeal:

"It is proper the correspondence between Colonels Harvey and Watterson between December 20, 1911, and January 12, 1912, be given to the public. . . . *The State* opens the bidding with an offer of \$200 for the exclusive privilege of publishing those letters unabridged. We shall not copyright. . . . THE INDEPENDENT is authorized to convey this challenge to publish to the Editor of *Harper's Weekly*. . . . We dare them to come out from behind Colonel Watterson's coat-tails. Bush-

whacking has been done, but they need not be skulkers."

We decline to be seconds to any challenge. The Columbia editor seems to be speaking with knowledge; but where, as in this case, there are charges of bushwhacking, skulking and lying, we prefer to get out from under as soon as possible and as far as possible, and then look on at a safe distance. The quarrel is hot, but it is not ours. Says Colonel Watterson's own paper, the *Courier-Journal*:

"Either Mr. Watterson or Gov. Wilson has lied. Whenever the Governor is willing to face the facts the Editor will be ready with the proof"

Japan and America

Mr. Jacob H. Schiff made an announcement last Friday at the luncheon in honor of the new Japanese Ambassador that will remove the chief grievance of Japan against the United States. It seems that the bankers of the four Powers—England, Germany, France and the United States—who are raising a loan of \$50,000,000 by which China can reform her currency and undertake certain internal improvements, have at last invited Japan and even Russia to join their circle. Japan never objected to the four Powers loaning money to China, even tho the interest on the loan was to be guaranteed by all the unhypothecated resources of Manchuria, where Japan now has a paramount interest. Her grievance was that one of the articles in the agreement pledged China to seek all future loans from the bankers of the four Powers, thus dethroning Japan from her position of leadership in the Far East. We have little doubt that Mr. Schiff, always a sincere friend of Japan, was the one who deserves credit for bringing about this happy outcome. Now there is absolutely no difference between Japan and the United States except the immigration question. Japan has officially acquiesced in our unofficial request and is preventing her emigrants from coming to our shores. Already the tide is flowing back to Japan. But tho Japan acquiesced, she justly feels our attitude is discriminating and unfair. We shall learn some time that there are no better people in the world to welcome here than the Japanese.

The British Coal Strike Much to be regretted is the failure of Prime Minister Asquith to secure an agreement between the British coal miners and the operators. The conferences have ended in failure, and now Parliament will put on the operators the stern hand of law in enforcing a minimum wage in the mines. Already in these two weeks more men have been thrown out of employment in factories and transportation than in the mines themselves, and a real disaster has followed such as might end in the stoppage of supplies of food and even in famine. The Government has for its duty to protect the people at large, even against the will of owners and miners, and its determination to end the strike by law is much to be approved. But this illustrates the new political economy which must rule under new social conditions. A few years ago it was supposed to be finally settled that governments must not meddle with prices; they were settled by the processes of competition. Now we know better. It is an extraordinary thing, a practical commercial revolution, for rates of wages to be settled by law. Now by general consent that will be done by Parliament which old economics branded as impossible. Thus step by step does the welfare of the people interfere with the freedom of contract, which has come to mean the power of the rich and strong to oppress the poor and weak. Thus also do principles of socialism advance in so far as businesses having to do with public utilities are concerned.

To Revise the New Testament There is started in the Church of England a movement to secure a new revision of the English New Testament. Those who are supporting it allow that the Revised Version of the Old Testament is very good; but that of the New Testament they declare lacks not correctness, but taste. The translators were so particular about their Greek that they neglected their English. They had hard and fast rules for translation which violated the English idiom. Particularly is this true in the use of the Greek aorist tense, which they always translated by the past tense in English, even when the English idiom requires the per-

fect tense. They also tried, so these critics complain, to translate Greek words always by the same English word, and they were so finical in their accuracy that they gave us at times quite awkward English. What was asked, then, in a memorial presented to the Archbishop of Canterbury, is a commission which will take as a basis the old Authorized Version, and put into it the corrections required by erroneous translations, and no more, thus keeping all the flavor of the old with the accuracy of the new. We think, and the Archbishop thought, that they exaggerated the faults of the Revised Version, since to those to whom old phraseology has become endeared any narration seems awkward and unmusical. Further, during these thirty years there has been much new light thrown on the Greek text, which we now test not so much by single manuscripts as by groups, Syrian, African, etc. We also, thru discoveries in Egypt, have a much better knowledge of the popular Greek. The Archbishop thinks it would be best to wait a while, or, at least, to try the experiment on a single book, such as the Hebrews, and see how far scholars could agree. This will be done. We think it will be best to let scholars on their own initiative try the task individually, and test the difficulty. We imagine that any new revision will correct such literalness as "the footstool of his feet." But the Revised Version is not bad, but good.

Wildcat Promoting

The swampy Everglades of Florida have recently had five canals dug thru them, with the intention of draining the great central lake, or at least lowering the water so that it will not overflow on to the lower land. This will, in time, make it possible to transform four millions of acres into as fine garden property as the world holds. It must not be understood, however, that this is the work of a year or of ten years. It will take at least that number of years to get the canals into perfect working order, and a few of the laterals, so that engineers can survey the whole land. No possible excuse can be given for those speculators who have induced homeseekers all thru the Northern cities to

buy farms where the land is not yet free of water, and will not be usable for twenty, or fifty years. It ought to be clear enough to any ordinary mortal that he should not buy landed property until he has seen it; but we are not all of us ordinary mortals; and so it comes about that thousands have farms, some of which must be approached with boats, and every acre of which must be drained by cross ditches connecting with the canals, before they can be cultivated. Trucking lands, of course, are generally flat lands, and especially when they are swampy they are preempted by mosquitoes. In the case of the Everglades, we have two or three degrees of latitude and as many of longitude, altogether a natural home for this pest, and he knows it. There are a few farms possible close by the large canals, and we believe that these are constructed to retain sufficient water for light navigation. Outside the swamp, and bordering it, there is some good farming land, and a few settlements. Congress does well to bring this matter to the open, and we are glad to read the primary platforms of the candidates for governor in Florida, which pledge an honest investigation and the driving out of dishonest companies. There is room enough for honest land promoters, and we believe there are some of them at work.

The profession of royalty is one of those which may be rated as extra-hazardous, as life insurance premiums say, as King Victor Emmanuel has again discovered. Most fortunately, he and his Queen escaped death at the hand of an anarchist crank, and a brave officer, who threw himself before the King's carriage, was only wounded. Again the Queen showed herself worthy of the love of her people by her courage and devotion in trying to shield her husband with her own body. It is pleasant to know that the Pope has expressed his horror at the attempted crime and his belief that the King is a good man.

Is ours a civilized or is it a savage country? Certainly savage in spots. We do not know of any other country in the world where suspected criminals are

caught by a mob and burnt alive. And we would have to go to some wild portion of Persia or Turkey to find the parallel to the attack by a band of outlaws on a court and the assassination of judge, prosecuting attorney, sheriff and a number of the jury, such as occurred last week in the mountains of Virginia, all because the organized assassins did not like to have one of their friends convicted and sentenced. This was a case of recall of the judge by pistols instead of ballots, and we do not like either method. Judges thereabout need to be very compliant to the popular will or very brave.

Another of those magnificent gifts is announced which do so much for education or other public benefit. This time an anonymous giver endows the Massachusetts Institute of Technology with two and a half million dollars, which may, however, be used in part to erect the buildings needed on the new site on the Charles River, in Cambridge. We shall now have Harvard and the Institute of Technology side by side, and a hundred years will show which kind of education the country wants.

After his first election to the Presidency Thomas Jefferson said:

"General Washington set the example of retirement at the end of eight years. I shall follow it; and a few more precedents will oppose the obstacle of habit to any one after a while who shall endeavor to extend his term."

Thomas Jefferson did not, later on, explain that he meant "to extend his term consecutively." Yet his election for a third term was loudly demanded.

The country will regret the resignation of Dr. Wiley as Chief of the Bureau of Chemistry in the Department of Agriculture. He has not been supported in the Department and he leaves for that reason, while his enemies remain. Dr. Wiley's service in assuring us pure food makes him one of the chief benefactors of the country.

Strange as it may seem, we don't know whether Washington, Jefferson, Jackson and Lincoln would all agree with us, on all points, today or not.

The Independent

VOL. LXXII NEW YORK, THURSDAY, APRIL 4, 1912

No 3305

Survey of the World

National Politics At the end of last week 318 delegates to the Republican national convention had been elected, and 265 of these are assigned to Mr. Taft, altho his opponents assert that he is not entitled to so many. Mr. Roosevelt's friends claimed 62 for him, but this was an excessive estimate. Mr. McKinley, manager of the Taft canvass, predicted that at the assembling of the convention the President would have more delegates than he had on the first ballot in 1908, when 702 voted for him. The majority required for a nomination is 539.—On the Democratic side only a few delegates have been chosen. A canvass made by an independent New York newspaper indicates leadership at the present time for Governor Wilson. Some of his friends say there is a movement for a combination of the supporters of Speaker Clark, Governor Harmon and Mr. Underwood in opposition to him. But this is denied. Mr. Bryan says to the Democrats of Nebraska that if they make him a delegate, and if a plurality at the primaries is given to Governor Harmon, he will resign. Governor Harmon, "a reactionary and the choice of the predatory interests," he will not support "under any circumstances." He is to make speeches against the Governor in Ohio, where the latter is opposed by the Progressive Democratic League.—At the Republican primary elections in the State of New York, under the new primary law, Mr. Taft was successful. It appears that the New York delegation will be divided as follows: Taft, 83; Roosevelt, 7. The ballots were very long, and the delivery of them was greatly delayed. Some districts in the great city had none

or received a supply just before the polls closed. The delay was due in part to legal proceedings, unsuccessfully instituted by friends of Mr. Roosevelt and relating to the position of printed names. It does not appear that if all the needed ballots had been supplied the result would have been changed, for many supporters of Mr. Taft were temporarily disfranchised. Mr. Roosevelt, in Chicago, denounced the primary as a "criminal farce." His friends opposed the re-election of Mr. Koenig, chairman of the Republican County Committee, but the vote was 921 to 37, in Mr. Koenig's favor. Mr. Taft was successful in the Indiana convention, where the delegates of the Roosevelt minority seceded and held a convention of their own. In Colorado the convention, by a vote of about 3 to 1, instructed delegates to vote for Taft. In Mississippi a Roosevelt minority held a second convention: Mr. Roosevelt was making speeches in the West. He declared that the machine was at work in New York for Taft; that the will of the people had been reversed in Indiana by "brutal fraud," and that the "Guggenheim machine" had been guilty of "foul play" in Colorado. His remarks in Chicago led many to think that he had in mind a bolt and a third party. This he denied, however, adding that such primaries as those in New York, Indianapolis and Denver were not binding upon Republicans. His speeches were marked by criticism of the Taft Administration. Speaking in Philadelphia on the 30th, Mr. Taft said:

"Some call themselves progressives, and there are others of us who are just as progressive but do not say so much about it. I am glad to express my gratification that this surface noise and lecturing does not represent the true sentiment of the people of this coun-

try. We are ready for progress on conservative principles. We have not the time to refute all the theories that noisy so-called reformers are advocating without having worked out their half-baked plans. A progressive is one that makes progress in the right direction."

He did not deprecate in any way the movement for reform, provided it was "sane and not affected with fads and a disposition to disturb those things that have been useful to us for a hundred years." Violators of law should be prosecuted, but there should be "no persecution and no disposition to run amuck just for the purpose of showing that the Government at Washington realizes that it has a job and is trying to make the people think it has."

Trust Cases At the conclusion of a trial which had consumed fifteen weeks, in Chicago, on the 26th ult., the ten accused officers of what is commonly called the Beef Trust were acquitted. Among these defendants, prosecuted on a criminal charge under the Sherman act, were J. Ogden Armour, of Armour & Co.; Louis F., Edward F., and Charles H. Swift, of Swift & Co.; Edward Morris, president of Morris & Co., and Edward Tilden, president of the National Packing Company. The cost of the trial was \$500,000 for the defendants and \$100,000 for the Government. The jurors were out nineteen hours, but there were only three ballots. On the first four voted for conviction; on the third all were for acquittal. One of them said the Government had not made a strong case, and he could not see that the people had suffered. He is a telephone inspector, residing in Streator. Nine of the jurors were from towns near Chicago. There were three farmers, two clerks, a baker, a tailor, a grocer, a carpenter, a drug salesman and a retired sailor. Prices of meats advanced after the verdict. Several of these defendants and their companies were indicted two years ago in Hudson County, New Jersey, but Governor Fort refused to ask for the extradition of the men. It is said that the prosecuting attorney will now apply to Governor Wilson.—In New York, on the 31st, John E. Parsons, Washington B. Thomas, Arthur Donner and George

H. Frazier, officers or directors of the American Sugar Refining Company, commonly called the Sugar Trust, on trial for a criminal violation of the Sherman act, in connection with a loan to Adolph Segal, of Philadelphia, by means of which, it was alleged, they kept his refinery closed, escaped conviction, the jury failing to agree. It is understood that ten were for acquittal. An interesting figure was the only witness for the defense, John E. Parsons, himself a defendant. He is eighty-three years old and for twenty years was general counsel for the accused company. He wrote the sugar refiners' original Trust agreement.—The Government has begun a suit in New York against the Hamburg-American, American-Asiatic and several other steamship companies, alleging that they, in violation of the Sherman act, control and monopolize traffic between this country and the Philippines, China and Japan. They are accused of maintaining a pool, fixing rates by conferences, and preventing opposition by rebates and other devices.

Congress The Senate refused, by a vote of 27 to 29, to declare vacant the seat held by Senator Stephenson, of Wisconsin, whose expenditure of \$107,000 upon the primaries has been the subject of investigation. On the following day, by a vote of 40 to 34, it declared that the charges against him had not been proved and that he was entitled to the seat. In the affirmative, for the Senator, were 28 Republicans and 12 Democrats; on the other side were 18 Democrats and 16 Republicans. The special committee conducting an inquiry as to the election of Senator Lorimer has voted, 5 to 3, in his favor, and has adopted a resolution exonerating him. The majority hold that the Senate, having once passed upon the case, cannot try him again on the same charge. It is said that a vote in the Senate would be against him, 50 to 39.—The Democrats of the House in caucus have decided, by a vote of 117 to 25, to make no appropriation this year for new battle-ships or public buildings. Secretary Meyer, greatly disappointed, says this will "depreciate the military value of the fleet as an insurance against war and

arrest progress." The leaders of the Democratic party, he adds, "are losing sight of the political and military necessity of the command of the Pacific."—The Senate, rejecting the Sherwood pension bill of the House, which called for an addition of \$75,000,000 a year to the pension payments, has passed as a substitute Mr. Smoot's bill, which would add \$25,000,000 a year.—New Mexico sends to the Senate Albert B. Fall and Thomas B. Catron, each of whom has been Attorney-General of the Territory. Arizona sends Marcus A. Smith and Henry F. Ashurst. The latter, addressing the Legislature after his election, said:

"The United States Senate has been aptly termed the 'American House of Lords' and 'the Millionaires' Club.' Its luxurious bath tubs and barber shops are typical of much of its personnel. Not all Senators have succumbed to its enticing luxuries, but many have. I pledge you that I shall spurn the gay and grafting swirl of Washington society, which has proved the undoing of so many men elected as servants of the people. I want none of the dinners of the wealthy, none of the palatial senatorial bath tubs or barber shops for mine. I shall demand the prompt passage of a bill subjecting the entire Federal judiciary from highest to lowest to the recall, which has been incorporated in our glorious Arizona constitution. The crooked decisions of these arrogant judges have scandalized and enraged the toiling masses. They shall be made to feel the rule of the people. I am not afraid to speak my mind fearlessly. I shall denounce wickedness and graft in high places. I will be heard."

His arrival in Washington is awaited with much interest.—A bill passed and sent to the President reduces from five to three years the residence period on a homestead taken from the public domain, and permits the entryman and his family to be absent five months in each of the three years. It is designed in part to check emigration from the West to Canada's new provinces.—Mr. Taft, in a message transmitting the Tariff Board's report on the cotton goods schedule, urges a considerable reduction of duties. Such a reduction, possibly an average of 30 per cent., is suggested by the report, which shows that the labor cost here of some items is less than the labor cost abroad, and that in certain other cases the present duty is two or three times the difference in costs of production.—Mr. Underwood, in a report

accompanying the introduction of last year's wool schedule bill, severely criticises the board's report on wool and woollen goods, saying it is "incomplete, erroneous and untenable."—William H. Glasgow, of Philadelphia, formerly a prosecutor of railroad cases for the Interstate Commerce Commission, is to be counsel for the Banking and Currency Committee in its inquiry concerning what is called the Money Trust.—The House, by a vote of 166 to 30, has passed a bill designed to tax out of existence companies that make white or yellow phosphorus matches, because the fumes of the phosphorus cause workmen to be afflicted by the dreaded disease known as "phossy jaw."

Labor Controversies On the 1st, 170,000 anthracite coal miners were idle, their two years' contract having expired, and the employing companies having refused to grant a wage increase of 20 per cent., with certain other concessions. A second conference with President Baer, of the Reading road, is to take place on the 10th, and some expect that an agreement will be reached, the companies consenting to give 5 per cent., or even 10 per cent. The bituminous coal miners demanded an increase of 10 cents a ton, with a shortening of time which would be equivalent to as much more. After a time, their leader in Illinois asked the employers if they would offer 5 cents a ton, and upon this basis a settlement was reached on the 29th. It affects more than 200,000 men.—Representatives of the locomotive engineers on fifty railroads asked for a wage increase which, the companies say, would cost \$7,500,000 a year. The application was rejected, and the members of the union are voting on the question whether there shall be a strike. Their chief says "The people need a powerful object lesson to teach them the absolute necessity of permitting the roads to increase freight rates."

Madero Losing in Mexico The battle north of Torreón between Madero's soldiers and Orozco's new revolutionist army continued for five days, and at the end of it the rebel victory was complete. The greater part

of the fighting took place near Jiminez. Gen. Gonzales Salas, Federal commander and Minister of War, committed suicide during the retreat of his beaten army to Torreón. There had been three divisions of the Federal forces, and no one of them knew what the others were doing. After the defeat of Salas, Gen. Tracy Aubert (he was born in Quincy, Ill.) arrived at the scene of hostilities with one of the other divisions, and attacked Orozco. He soon found his forces outnumbered and in a trap, from which he escaped only by hard fighting and the help of darkness. The rout of Salas's division had been caused by Orozco's strategy and a novel use of dynamite. As the Federals were moving northward, a part of Orozco's army, going by a circuitous route, gained a position in the rear of them, and they were cut to pieces when, panic-stricken by the attack of Orozco's dynamite-laden locomotive in front, they turned southward. On the 28th, all the Federal troops were going back to Torreón, tearing up the railway track as they fled. Orozco prepared to attack Torreón. He had had an abundant supply of arms and ammunition before the battle, and this supply was increased by captures from the enemy. The situation caused much anxiety at the Mexican capital and in Washington. In the south, Zapata was unrestrained. On the 30th his forces killed 50 Federal soldiers who were guarding a passenger train only 40 miles from the capital. One day earlier our Government shipped from New York by steamer to Ambassador Wilson 1,000 Krag-Jorgensen rifles and 1,000,000 rounds of ammunition for the use of American residents. This was done with Madero's consent. The German colony had already bought 500 rifles, and the English residents had engaged a special train for the time when it might be needed to carry them to Vera Cruz. The Americans are required to pay \$6.25 for each rifle. Our Government, altho not intending to intervene, inquired of steamship companies as to the ships which might be engaged to carry troops. It also invited State officers of the National Guard to visit Washington, where conferences as to the use of the militia were held. Madero minimized the diffi-

culties of the situation and sought to suppress the facts by a rigid censorship. He also unwisely suppress the *Mexican Herald*. An old story about negotiations with Japan for the establishment of a coaling station and Japanese colony on the shore of Magdalena Bay was revived. Enrique C. Creel denies that he or his father-in-law, General Terrazas, has deposited \$4,000,000 or any sum whatever in El Paso banks for the use of Orozco.

The Panama Canal Colonel Goethals, chief engineer of the Panama Canal, returned on the 28th ult. from Europe, where he inspected the Kiel Canal and the docking facilities at several ports. If the gate contractors finish their work by June 1, 1913, he says, the canal will be open for ships about August 1 of the same year. He spoke as follows of his conversations with the Kaiser:

"On March 10 I had luncheon with the Kaiser at Berlin and was surprised to find how much information he possessed concerning the canal. He is of the opinion that the canal ought to be very strongly fortified and that we should have a larger military force there than is now intended. He laid great stress on the opinion that we should have the most modern fortifications and a very strong force there. The Kaiser is also of the opinion that the width of our locks, 110 feet, is not enough. He has made provision for great warships of the future by insisting that the locks of the Kiel Canal be 135 feet in width."

On the 30th, the official *North German Gazette* said it was authorized to state that the Kaiser had not made the remarks about fortifications attributed to him by Colonel Goethals. The latter, however, who had already repeated them before a House committee, insisted that he had correctly reported the Kaiser's words. Testifying before the committee, he opposed discrimination in favor of our coastwise trade, or the exclusion of ships owned by railroad companies, and suggested that the Zone should be allowed to become an uninhabited jungle, as a safeguard in case of war.

The Philippine Islands In addition to the bill recently introduced, providing for the independence of the Philippine Islands, under certain conditions, Mr. Jones, chairman

of the House committee on Insular Affairs, has offered a joint resolution, declaring it to be the opinion of Congress that the President should now open negotiations with the great Powers of the world for neutralizing the islands and guaranteeing their independence. Such neutralization is said to be a part of the Democratic plan. The bill, a very long one, including a constitution, provides that a probationary period for the islands shall begin on July 4, 1913, and that their independence shall be full and complete on July 4, 1921. During the trial period, there is to be a President, appointed by the President of the United States, and the latter is to exercise veto power over acts of a Philippine Congress. It is expected that the bill, which has the approval of Resident Commissioner Quezon, will be passed in the House.

West Indies and Central America

The revolt in Santo Domingo, under the leadership of Horacio Vasquez, has not been suppressed. This leader's brother Francisco, Minister to France, is held in prison at the capital, as a hostage for him. Dispatches from the island say the Government is unpopular, that President Eladio Victoria is a figurehead, and that the real ruler is his nephew Alfredo, Minister of War, only twenty-seven years old. It is asserted that thirty men accused of complicity in the assassination of President Caceres were executed without trial.—General Estenoz, president of the Independent Colored Party of Cuba, has complained to our Government because President Gomez, having forbidden the negroes to form a party, orders the rural guards to break up their meetings.—The revolutionists in Honduras have been routed in battle, and Valladares, their leader, has fled. It is said that 250 of his followers were killed.—From Venezuela, Secretary Knox went to Santo Domingo, and then to St. Thomas. He ridiculed the story about the discovery of dynamite bombs planted for the destruction of his train in Nicaragua, but the report is confirmed in Nicaragua's Official Gazette.—A conference is in progress at Ottawa between the Canadian Government and delegates

from nine West Indian colonies, relating to reciprocal agreements by which Canada expects to increase her trade with the islands.—Following the capture of Paraguay's capital by the revolutionists, by a battle in which 600 were killed, a provisional Government was formed, and ex-President Emiliano Naveiro was appointed President.

The Government bill for **British Affairs** Home Rule in Ireland will be introduced in Parliament on April 11, and will be entitled the "Irish Government Bill."—The Treasury statement issued March 30 showed a net balance for the past year amounting to \$32,725,930.—The bill providing for a partial extension of the suffrage to women, known as the "conciliation" bill, was rejected by the House of Commons on March 28 by a vote of 222 to 208. It was not a party vote and there were many absentees. Its failure is blamed upon the rowdy tactics of the "militants," who are not disturbed at the result, as they had condemned the bill for failing to enfranchise other women than some 1,000,000 property-holders.—At a suffrage meeting held in London last week an addition of \$50,000 was made to the "war fund." Mr. and Mrs. Pethick Lawrence, editors of *Votes for Women*, have been committed to stand trial on the charge of conspiracy at the Old Bailey sessions. They were released on bail aggregating \$35,000. Mrs. Pankhurst also will be put on trial, but just now she is serving an earlier two months' sentence, pronounced March 2. Women arrested for window smashing have received terms of four, six and eight months, in some cases. Others of the 200 prisoners now in Holloway have only a fortnight to serve. Since the mutiny of suffraget prisoners some time ago the privilege of receiving visitors has been withdrawn.—British military authorities have lately awakened to the importance of the "Flying Corps" and will bring this arm of the service to a high standard. France is better equipped in this respect, but a wave of popular enthusiasm for military aviation has resulted in subscriptions in its behalf. Auguste Rodin has presented to the *Paris Matin*, a sculpture entitled "La Dé-

Copyright, Underwood & Underwood, N. Y.

FISHING FOR COAL AT DOVER

Workmen and their children are busy at Dover, England, recovering coal from the harbor by means of nets. The coal has been dropped into the sea from time to time when ships were being coaled and has now accumulated in large quantities. This illustration shows the distribution of coal after it has been landed.

fense," in commemoration of the patriotic efforts of this journal. The work represents two figures, one winged, with arms outstretched in protection of the other, which is half recumbent. Even Turkey is now alive to the possibilities of the aeroplane as an instrument of warfare, and the Ministry of War has decided to create a school and training ground for military aviation at Bulgurlu, above Skutari, on the Asiatic shore of the Bosphorus. Two Turkish officers now studying flying at Paris will direct it.

The British Coal Strike Ended?

Sunday's despatches represented the British coal strike to be "as good as over," and it is believed that the vote taken by the miners on the proposal to return to work will be found overwhelmingly favorable to the proposition, almost all the labor union leaders having advised this course. The minimum wage bill has passed both houses of Parliament, and

received the royal assent March 29. A split in the Labor party is likely to follow strained relations over the coal crisis. The trade-union and Socialist wings amalgamated in 1909, and will now probably separate again. The action of the miners in returning to work—as many thousands have already done—is due to the great distress prevalent, millions having endured the last few weeks in a state of semi-starvation. The worst famine spot has been the Potteries District: Stoke-upon-Trent, Hanley, Burslem, Tunstall, and Newcastle-upon-Lyme: Mr. Arnold Bennett's "Five Towns." The distress has been by no means confined to coal miners. Prof. H. S. Jevons estimates that the strike has cost the United Kingdom \$50,000,000 a week. It has run over a month. The decision of the British coal mine owners to accept the Government's Minimum Wage bill was taken March 27. The Government has suffered thruout the crisis from dissension within the Cabinet, for which Mr. Lloyd George is held responsible. The

Chancellor's stock is now at its lowest point, and the prestige of Prime Minister Asquith is almost correspondingly heightened. Syndicalism, notwithstanding the success of the trade unionists in incorporating a minimum wage principle in an emergency bill, is regarded as having received a blow. Tom Mann, whose arrest on the charge of inciting soldiers to mutiny was noted in this department last week, is out on bail, but was committed for trial on March 30.—On the same day, the French Chamber of Deputies voted a bill providing for an eight-hour day for coal miners. This will, it is believed, remove the possibility of a general strike in the French coal fields. Some 4,000 men in the Anzin District had been out and the movement had spread to the Aniche district.

France, Spain, and Morocco

The Minister of Marine, M. Delcassé, won a brilliant victory when the French Senate adopted his elaborate plan for naval construction (March 30). The new program will be initiated May 1, 1912, and will run on without further legislation until 1920, when France should have in commission twenty-eight battleships equal in armament, speed and tonnage to those called for by the British and German programs. A notable revival of patriotism and of the military spirit in France has lately occurred.—The Paris Geographical Society has voted to present Dr. Charcot with its gold medal in recognition of scientific work achieved in south polar regions by the *Pourquoi Pas* expedition. This is interesting at a time when word has just come from the commander of the *Terra Nova* expedition, Captain Scott, of the English Navy, that he (Captain Scott) will remain in the Antarctic "another winter, in order to continue and complete his work."—A series of crimes by motor-car bandits, described by the police as anarchists, has agitated Paris, northern France, and Belgium. On March 25 a band of six robbed a bank at Chantilly, killing three men and wounding two. Only one arrest has been made. The bandits never use a car of their own, but steal one, which they abandon after the crime has been committed. They are said to have

killed more than twenty persons in their career of crime, extending over three years. Gaston Calmette, of *Le Figaro*, demands the transportation of all confirmed criminals.

"There is constant prating of the amelioration of the workingman's social conditions; the amelioration which is most urgently called for is the moral cleansing of the milieux where workingmen labor, live and suffer."

Other writers compare present conditions in Paris to those obtaining in Bret Harte's California, and urge the increase of the number and the pay of the police, their equipment with whistles, etc. Meanwhile, M. Lépine, the veteran Prefect of the Paris police, has been elected a member of the French Institute, Section of Moral and Political Sciences.—On March 30, Mulai Hafid, Sultan of Morocco, signed a treaty establishing a French protectorate. The terms follow those of the Bardo treaty by which a French protectorate over Tunis was established in 1881. The Government of Tunis is carried on under the direction of the French Foreign Office, which has a special department for Tunisian affairs, under the control of a French Resident-general, who is also Minister of Foreign Affairs of Tunis, and a ministry of nine heads of departments, seven of them French, two of them Tunisians. The Bey of Tunis is only a figurehead. The country is divided into thirteen districts (*contrôles civils*), two military circles, and one military post. The district Governors, or *Contrôleurs*, are French; the subordinate officials (Kaïds, Sheiks) are native. There are French tribunals to administer cases between subjects of European Powers, and between such subjects and natives; native courts administer justice where natives alone are concerned.—The French Prime Minister, M. Poincaré, refers to the Moroccan treaty, now signed by the Sultan, as the "sequel and corollary of the Franco-German Agreement of November 4, 1911." His ministry received a vote of confidence, following interpellations on the Moroccan situation, by a majority of 332 (March 22). Just what arrangements have been made with Spain remains in doubt. According to French accounts of Spanish compensation proposals, published March 21, Spain has offered to cede to France the

coast-line of her southern Moroccan zone up to a short distance above Ifni, and to agree to a rectification of the boundary in the Wergha Valley, in the northern zone, upon condition of a rectification in her favor on the Muluya. The Sultan of Morocco has been quoted as saying that Spanish agents brought pressure upon him to oppose signing the treaty providing for a French protectorate. Spanish forces in Morocco have lately met reverses at the hands of the Riff tribesmen, and will be reinforced. It is said that General Weyler will have supreme command in Morocco. Premier Canalejas wishes to strengthen the Spanish military and naval forces.

Turmoil in China

On March 29 the presidential seal was formally delivered to Premier Tang Shao-yi, as the representative of Yuan Shi-kai, by Dr. Sun. The scene was the hall of the Republican National Assembly at Nanking. Dr. Wu Ting-fang is not a member of the new cabinet, in which Lu Cheng-hsiang is Foreign Minister; Hsiung Hsi-ling, Minister of Finance; Lin Kwon-hsung, Minister of Marine; Tuan Chi-jui, Minister of War; Wang Chun-hui, Minister of Justice; Liang Ju-hao, Minister of Communications; Chen Chi-mei, Minister of Commerce; Cheo Ping-chun, Minister of the Interior; Tsai Yuan-pie, Minister of Education, and Sung Chiao-fen, Minister of Agriculture. The Premier says that \$150,000,000 is required for the support of the Government, of which sum \$35,000,000 is to be used for paying for the war of the revolution.—The action of President Yuan Shi-kai in secretly negotiating for a loan of \$5,000,000 from the Belgian group of bankers has upset the plans of the financial group of the four Powers, Great Britain, France, Germany and the United States, which had arranged to loan China all of the money needed for internal developments. They therefore refused to provide the loan of \$300,000,000 which has been arranged for, or even to advance the funds necessary for the support of the Government in the present crisis. On March 25 the ministers of the four Powers made a joint protest to the Chinese Government against the alleged bad faith. The

bankers of this group consented recently to admit both Russia and Japan to the privileges of the loan. It is suspected that Russian interests are backing the Belgian loan in order to secure control of the Mongolian railroads, as the next instalment of the Belgian loan of \$30,000,000 is to be applied to the extension across Mongolia of the Peking-Kalgan railroad. This railroad, which was constructed by Chinese capital and Chinese engineers, is an admirable piece of engineering, involving as it does the many bridges and tunnels in its passage thru the mountains to the Great Wall. It was their success with this railroad which gave the Chinese confidence in their ability to build their own railroads, and hence to the repudiation of the action of the Government in negotiating a big loan from the four Powers for internal improvements. The Belgian syndicate professes to be able to supply all of the money needed, even the \$300,000,000 contemplated in the agreement with the four Powers. The securing of ready money by both the Peking and Nanking Governments has contributed greatly to the quieting of the country. The soldiers, having received some of the money due them, have stopped mutinying, and General Sheng-yuan, who was reported last week to be marching with an army upon Peking with intent to re-establish the Emperor, is said to be willing to stop his progress if the Government will pay off his troops. Mutiny, rioting and looting has, however, occurred at Foo-chow and at Swa-tow, when the German consulate was burned and it became necessary to land a force of marines from the United States monitor "Monterey" to protect the custom house and American property at Swa-tow. Three American teachers were attacked by pirates on the Yang-tse River, March 25; one of them was killed. A Chinese multimillionaire, Sheng Kung-pao, had to pay a ransom of \$100,000 to the brigands who had kidnapped his only son and threatened to send back a finger a day until they got their money. The Nanking Assembly, in response to a petition from Chinese women, passed a resolution favoring woman suffrage.

The Sabbath Eve

BY JOHN GREENLEAF WHITTIER

[This is one of Whittier's early poems, never collected. It was written in October, 1827, while he was a student in Haverhill Academy. In it we see the germ of two later poems, each of which has for title "The Worship of Nature." The first of these later poems appeared in the *New England Review* of January 24, 1831, and may be found among the "uncollected poems" in the volume entitled "Whittier-Land." The second poem with this title is in the "Tent on the Beach," published in 1867. It is a curious fact that while not a line of this latest version is identical with that of 1831, tho the title and theme are the same, yet there are several phrases in the poem here given, that were adopted forty years later. —SAMUEL T. PICKARD.]

It is a blessed hour. The star
Of evening lights the sleeping wave
And blossoms in its purple home
A lily on the dewy grave
Of parted twilight. Its soft beam
Comes purely down o'er hill and stream
As if it bore to sinners here
Sweet tidings from a holier sphere.

O'er yon blue rocks the lonely trees
In shadowy groups recline,
Like pensive nuns at evening bowed
Around their holy shrine;
And thru their leaves the night winds
blow,
So calm and still, their music low
Seems the mysterious voice of prayer,
Faint echoed on the evening air.

The mists go up from lake and stream,
Like incense to a God beloved,
And o'er the glowing waters move,
As first the Holy Spirit moved.
The torrent's voice, the wave's low hymn,
Seem the fair songs of Seraphim,
And clearer glows yon veil of blue,
As Eden's light were breaking thru.

There is a dream of blessedness
In every hue of earth and heaven,
And the calm face of Nature wears
The sweet look of a saint forgiven;
Oh, who on such an eve can feel
Heaven's purest influence o'er him steal,
And muse upon the glories there,
Nor kneel like Nature's self in prayer?

The Importance of an Independent Judiciary

BY ELIHU ROOT

UNITED STATES SENATOR FROM NEW YORK.

[No one is better qualified to speak on the above subject than Senator Root, president of the New York State Bar Association. In an address before the association, as well as upon the floor of the Senate, he has recently portrayed the fallacy of the present inclination toward popular recall of the judiciary and at the request of THE INDEPENDENT presents in this paper some of the arguments contained in those addresses.—EDITOR.]

A COMPARATIVELY new condition confronts us in the Americans toward impatience with the courts whenever judicial decisions do not agree with their wishes. There are many indications that, in varying degrees, in different parts of the country, methods of punishing the court for not entertaining some different opinion are receiving popular sympathy.

The respect for the decisions of our courts which has sustained the judicial branch of our Government has been based upon the idea that judicial decisions are something quite distinct and different from the expression of political opinions or the advocacy of economic or social theories. Devotion to the reign of law, with its prescribed universal rules, as distinguished from the reign of men, with their changing opinions, desires, and impulses, has inclined us always to ascribe a certain sanctity to the judicial office. We have invested its holders with a special dignity and have regarded them in the exercise of their office with a respect amounting to reverence, as above all conflicts of party and faction, because they were the officers guarding the law as it is. We have always been imbued with a deep sense of the truth that upon the preservation of the law depend the preservation of order, the prevention of anarchy, the protection of the weak against the aggression of the strong, the perpetuity of free institutions, the continuance of liberty and justice. And these matters are of infinitely greater concern than all the new proposals which excite the activity and controversy of parties and political leaders, of critics and reformers. To change this view and consider the de-

cisions of our courts in the same way and upon the same presumptions as in the case of political opinions means that the authority of the courts will inevitably decline; that the independence of the judicial branch will cease, that judicial decision must interpret the law always to suit the majority of the moment, and the recall will be the natural and logical expression of the relation to be assumed between the people and the courts.

There are several things to be said about this feeling. In the first place, it rests upon a misconception of the true function of a court. It is not the duty of our courts to be leaders in reform, or to espouse or to enforce economic social theories, or, except in very narrow limits, to readjust our laws to new social conditions. The judge is always confined within the narrow limits of reasonable interpretation. It is not his function or within his power to enlarge or improve or change the law. His duty is to maintain it, to enforce it, whether it be good or bad, wise or foolish, accordant with sound or unsound economic policy. By virtue of the special duty imposed upon them, our courts are excluded from playing the part of reformers. Their duty is to interpret the law as it is, in sincerity and truth, under the sanction of their oaths and in the spirit of justice.

In the second place, this impatience proceeds upon a misconception of the true nature of the remedy for an unsatisfactory decision. If the law, as declared by a court of last resort, bars the way of some popular movement, the true remedy is not to threaten the court with extinction or its members with punishment unless they will decide against their convictions; but to set the law-making

body in operation to change the law. When a community is not satisfied with a law as it is declared by the court to be, it is not a desirable thing to coerce or reconstruct a court to force it to say that a law is what it is not. The right way is to make the law what the community wishes it to be. This is not difficult, for when a majority of the people wish a law to be changed it will be done. Proposals, in whatever form, to subordinate the decisions of the court to the decision of a majority of voters, whether it be by punishing the judges for an unsatisfactory decision thru removing them from office or by reviewing their decision at the polls, instead of reviewing and revising the law upon which the decision is founded, proceed upon a failure to realize that this method involves an abandonment of the most essential feature of our system of constitutional government. By destroying the independence and authority of the courts and the popular habit of submission to their decisions, we should lose infinitely more than we could gain.

The prevention of unlimited power is of such vast importance to liberty that no particular case can possibly be important enough to justify abandoning the maintenance and the observance of the general rule of prescribed limitations. The door opened for the well-meaning and far-seeing lover of country to exercise power without regard to the limitations set upon it is also a door opened for the self-seeking and ambitious to disregard the same limitations for their own advantage. It is impossible to maintain a rule of limitation upon power which is to be observed when it seems wise and ignored when it seems unwise.

Our fathers realized that the nature of men is not greatly changed by a change in the form of government, and that the possession of overwhelming power affords a constant temptation to override the rights of the weak. Therefore, they prescribed certain general rules, in a Constitution which was to be binding upon legislatures and executives and judges when they came to deal with particular cases. The difference between constitutional limitations and a legislature dealing with particular exigencies is not that one represents the people more truly than the other, or is of

any higher character than the other, but that one deals with justice, with right conduct, with the requirements of liberty, impersonally and in the abstract without reference to individuals or the interests or prejudices or inconveniences of particular cases; while the other deals with the particular cases to which the general impersonal rule applies. Human nature is such that the two cannot be combined. A decision upon a rule of abstract justice cannot be combined with a decision as to the accomplishment of a particular wish, any more than a man can render justice when he sits as judge in his own cause. If the law-making body of the moment, whether it be a representative legislature or a majority at the polls, is to determine at the time of action either what shall be the rules to control its conduct, or whether its conduct conforms to the rules already prescribed, that conduct is controlled only by the will of the law-making body at the moment of action, and our whole system of prescribed limitations upon power disappears. The necessary result is that the barriers we have set up from the beginning of the government against official

HON. ELIHU ROOT
Senior Senator from New York

usurpation of power and against official invasion of the liberty and rights of the individual are broken down, and the power of the majority according to the will of the moment is supreme and uncontrolled. We cannot maintain one system in part and the other system in part.

A sovereign people which declares that all men have certain inalienable rights and imposes upon itself the great impersonal rules of conduct deemed necessary for the preservation of those rights, and at the same time declares that it will disregard those rules whenever in any particular case it is the wish of the majority of its voters to do so, establishes as complete a contradiction to the fundamental principles of our Government as it is possible to conceive. It abandons absolutely the conception of a justice which is above majorities, of a right in the weak which the strong are bound to respect. It denies the vital truth taught by religion and realized in the hard experience of mankind, that human nature needs to distrust its own impulses and passions and to establish for its own control the restraining and guiding influence of declared principles of action. If we yield to the impatience which would destroy the system that alone makes effective the great impersonal rules and preserves our constitutional government, rather than endure the temporary inconvenience of pursuing true methods of changing the laws, we shall not be reforming, but we shall be exhibiting the weakness which thoughtful friends of free government the world over have always feared the most—the lack of that self-control which enables great bodies of men to abide the slow processes of orderly government rather than break down the barriers of order when they obstruct the impulse of the moment.

The appeal to prejudice and passion and hatred finds its natural sequence in appeals to force and in destruction of order. True love of country is not mere blind partisanship. From time to time there appear in all courts cases which enlist great popular interest. Sometimes they are cases in which men are accused of crime, and the tendency of the public in abhorrence of a great crime is to assume that the man who is declared by the police authorities to be responsible is responsible, to assume that the man who is

charged is the man who is guilty. Too often, even now, lynching is resorted to, because the excited people of a community take what appears to them to be justice into their own hands. Sometimes political questions in court attract great public interest. Sometimes such questions arise from the conflict of religious opinions. Picture to yourself a judge before whom one of these cases is brought. A few people—one single man, perhaps—upon one side and the powers of a multitude upon the other side. For the few, the weak, there stand only the rules of law. On the other side stands the public desire to have a decision in accordance with the public feeling. Consider the frame of mind of the judge who is called upon to decide one of these cases, when he knows that if he decides against public feeling immediately a recall petition will be filed, and the people against whose wish he has ruled will be called upon to vote whether they prefer him to some other man who has never offended public opinion.

A vast majority of these cases depend upon evidence which is produced in the trial and which enters into the record of the case. But the public does not see the record. It receives its information from the press. The conditions of newspaper enterprise do not permit the publication of the full record of any trial. The reporters catch upon the spectacular, the interesting and the startling incidents. The judge has to pass upon the evidence that appears in the record, but he is to be judged upon the newspaper reports of the trial. Is it in human nature that a judge sitting under such circumstances shall do other than try his case rather to the reporters than to his knowledge of the law and his understanding of the facts? Human nature cannot work otherwise. In all of the great cases of public interest the judge will be on trial on the newspaper record, and on that record the excited, interested, disappointed public will remove him from office by simply voting "yes," on the ballot of recall. Are we ready to put the judge who alone can maintain the rights of one against the governing party at the immediate mercy of that governing party? Are we ready to say to the judge whom we put upon the bench to maintain the great principles of justice, "You shall maintain

them under the penalty of being deprived of your office and being disgraced for life if you oppose the will of the governing body”?

I have no quarrel with those who extol the wisdom of the people. I believe that in the long run, after mature consideration and full discussion and when conclusions are reached under such circumstances as exclude the interests or the prejudices or the passions of the moment, the decisions of the American people are sound and wise. But they are sound and wise because the wisdom of our fathers devised a system of government which prevents our people from reaching their conclusions except upon mature consideration. They provided that the government which may seek, under the interest or the passion of the moment, to override those rules of justice shall be withheld by the judgment of a body of public officers separated from the interests and the passions of the hour, with no pride of opinion, no lust for power; impartial, sworn only to the administration of justice, without interest, without fear, and without favor—without fear of revenge or hope of reward.

When the passion of the moment comes into play, when religious feeling is rife, when political parties are excited, when the desire for power here or the desire to push forward a propaganda of views there comes into play, the inherent weakness of human nature makes it certain that any opposing fundamental principles of right will be disregarded, if possible. This is why the provision for the recall of judges strikes at the very heart of the fundamental and essential characteristic of our system of government. It nullifies it. It sets it at naught. It casts to the winds that protection of justice that our fathers established and that has made us, with all our power, a just and ordinary people. For when we say to the judge upon the bench, “If you maintain the abstract rule of justice against the wish of the people at the moment, you shall be turned out of office in ignominy,” we nullify the rule of justice and establish the rule of passion, prejudice, and the momentary demand of the excited mob. This is not progress. It is not reform. It is degeneracy. It is a movement backward to those days of misrule and unbridled power, out of

which the world has been slowly progressing; to those days when human passion and the rule of *men* obtained instead of law and the rule of *principles*. It sets at naught the great principle of government and of civilized society—the principle that justice is above majorities.

Time was when the feelings, and the passions, and the wishes of the strong determined the rights of the weak—oft-times even the right to life itself. But in this twentieth century, with all the light of the civilization of our times, after a century and a quarter passed by this great and free people, following in the footsteps of Washington, Hamilton, Jefferson, and Madison, with all the people of the world now following in their footsteps in the establishment of constitutional governments, the hand of a single man appealing to that justice which exists independently of all majorities, has a power which we cannot ignore or deny—except at the sacrifice of the best and the noblest elements of our government. For there is such a thing as justice, and tho the greatest and most arrogant majority unite to override it, God stands behind it, the eternal law that rules the world maintains it, and if we attempt to make the administration and award of justice dependent upon the will of a majority we shall fail. We shall fail at the cost of humiliation and ignominy to ourselves.

Shall we envy the men who see nothing to admire in John Adams defending the British soldiers against the protests of his neighbors and friends and countrymen after the Boston massacre? Or shall we rather feel that our country loves justice and possesses that divine power of self-restraint without which the man remains the child, the citizen remains the savage, and the community becomes the commune? The first duty of popular self government is individual self control. The essential condition of true progress is that it shall be based on grounds of reason, and not of prejudice. These are truisms, but they are also essentials; and if at any time they should be forgotten—and they seem to be, sometimes—we should recall them and insist upon them and preach them, for they are a most important part of the gospel of human freedom.

Our Southern Highlanders

BY WILLIAM GOODELL FROST, D.D., LL.D.

[The writer of this article is president of Berea College, which is situated in the heart of the mountain country in the South and which educates more mountaineers than any other educational institution in the country. No one can speak with more authority on our Southern highlanders than President Frost.—EDITOR.]

THE object of this article is explanation. The daily press is bringing us news from the Virginia mountains which is startling indeed. What are the conditions which make such lawlessness and bloodshed possible? How are we to believe that the Southern mountaineer is the most hopeful man in the South when representatives of the mountain clans are guilty of such deeds?

To begin with, let us draw a distinction between the degenerate and the unregenerate—the man who has fallen from a higher state of civilization into a lower one and the man who has not yet emerged from a lower state into a higher. Mountain countries have always been lands of survivals. New ideas penetrate more slowly and the old ideas persist longer. The whole South has been moving more

slowly toward modern conceptions than the North. Its original settlers, so far as there was any distinction between those of the North and the South, were more conservative and more aristocratic. Slavery suppress free speech and made all progress difficult, while it intensified the old world feeling that God intended certain families to be rich and mighty and other families to be poor and humble.

The Greek historian, Thucydides, counted it a great step in the history of Athens when the people ceased to carry weapons while engaged in their daily occupations. This step was not taken in England until after the time of Elizabeth, and this step has not yet been fully taken in the South. Consider, for a moment, the mental attitude of the Elizabethan

BAD MOUNTAIN ROADS MEAN ISOLATION

THE INTERIOR OF A MOUNTAIN CABIN

gentleman who carried a sword or the Southern gentleman who carries a revolver. He has not yet entrusted himself in all things to the protection of his Government. He looks upon the State as an organization for carrying on foreign wars, but feels that it is his own prerogative to defend his property, his household and his honor with his own right arm.

This temper, still strong in all the South, is naturally strongest in the mountains, where, as a matter of fact, the Government has not always been able to inspire either confidence or fear. The conditions which sometimes justified arming for self-defense on the frontier are likely to be present more or less in many parts of the South, and particularly in the mountains.

The operations of the Government are weakened by the fact that it has never had the thoroughgoing efficiency known in some other places, and the further fact that mountains furnish convenient refuges for those who defy the law. Moreover, in Southern communities which have received no foreign influx

and send out few settlers to the West, everybody is related by ties of blood to everybody else. In rural life this counts for much. Family loyalty requires that one support his kindred in court and quarrel to the last traceable degree.

The general history of the mountain region begins about the time of the Revolutionary War. The mountain men were mighty at the battle of King's Mountain. Daniel Boone was besieged by Indians under a British officer in his fort near Berea, and summoned to surrender in the name of King George. At the close of that struggle troops of young soldiers went west across the mountains. Many of them settled in the mountains, finding sufficient good valley land for that first generation, as well as the good water and the good hunting which a frontiersman prizes. No man could have foretold at that time the coming of canals and railroads. The sons of the Revolution who settled in the first mountain valleys were entirely unconscious that they were condemning their posterity to isolation. They took into the hills the civilization of their time, and their posterity can

hardly be blamed that they have not added to that civilization the elements and ideals of modern life.

Besides the isolation of nature, there soon came the isolation of social antipathies. The mountain men were not the poor whites, because they were land-owners. On the other hand, however, they were not slave-holders, and this fact soon separated them in feeling from their fellow-citizens of the surrounding lowlands. It was a startling surprise to the Confederate leaders to find that West Virginia seceded from secession, Kentucky was held in the Union by its mountain end, and East Tennessee all but wrested from the clutches of the Confederacy. Union soldiers were freely enlisted in the mountain counties of South Carolina and Alabama.

One of the first recognitions of the mountain region as a sociological unit is found in a chapter of Olmsted's "Journey in the Back Country," published in England in 1860. Earlier than this, Principal Rogers, of Berea, had written for

THE INDEPENDENT several articles which were probably the very first notices of what we now call "Appalachian America." Olmsted found game abundant in the mountains, sleds used in place of wagons, and slaves very few. "Extreme poverty," he tells us, "is rare in the mountains, but a smaller proportion of 'fore-handed folks than in any other part of the civilized world.'" "The women, as well as the men, generally smoke." "The people are open-hearted, frank, and kindly."

Since Olmsted's time the game has been largely exterminated; the population has increased as rapidly as the laws of nature will allow, and is now too great for the agricultural resources of the country. The use of tobacco by women has largely ceased—counties which consumed tons of snuff in 1860 now afford no market for that commodity.

Now there were numerous instances of feuds and frontier lawlessness in the mountains before the war, but that struggle gave them a new impulse. The fight-

A MOUNTAIN JURY AT THE NOON RECESS

A MOONSHINE STILL IN THE MOUNTAINS

ing tendency in our race indicates at least some vigor, and when the pugnacity of the frontier was re-enforced by the enmity of the war, and a generation of boys grew up in the atmosphere of civil strife, all the conditions were made ready for the serious feuds and persistent lawlessness which have been manifested in the mountains since. It is not the fact that these "wild-doings" involve any considerable portion of the population, but law-abiding people have been unable to suppress them.

John Fox repeats an old mountaineer's story as follows:

"Folks usen to talk about how fur they could kill a deer. Now hit's how fur they can kill a man. Why, I have knowed the time when a man would have been druv outen the country fer drawn a knife or a pistol, and if a man was killed it was accidental by a Barlow. I reckon folks got usen to weepins, and shootin' and killin' from the bresh, endurin' the war, but hit's been gitten wuss ever since; now it's dirk and Winchester all the time. I know all the excuses folks make. Hit's fair for one as 'tis fer t'other. You kain't fight a man far and squar' whool shoot you in the back. A poor man kain't fight money in the courts. There hain't no witnesses in the laurel bushes but leaves, and dead men don't have much to say. I know it looks like lots of decent young folks hev got usen to the idee. Thar's so much of it

goin' on, and so much shootin' from the bresh, I do reckon it's wuss nor stealin' to take a feller critter's life that-a-way."

Even such a recital shows the existence of a code of honor and a moral standard. Non-combatants are never molested; women are never molested, in these mountain wars. An excursion party of our teachers and their friends, a few years ago, passed through a county where a feud was in progress, with some fifty active partisans on each side. Hostilities were absolutely suspended while the excursionists were in that vicinity. Members of both sides came to the camp in the most friendly fashion. But the very day the excursion passed the county boundary a "battle" took place, in which two men were killed.

Incidentally, the old mountaineer shows also the mountain standard on the matter of stealing. Doors are never locked in the mountains. Surveyors never have their accoutrements stolen. There are other all but universal virtues in the mountains, like hospitality, which show the solid foundation. The important thing in character is a standard, though it may not be *my* standard. Every social group is likely to prize too highly its own special virtues, and con-

done too lightly its own special weaknesses. All this simply shows that disregard of life in the mountains does not indicate so much depravity as it would in New England.

This, then, is the situation: a territory of vast extent, isolated from the world, and each valley isolated from its neighbor valley; the people of pure English and Scotch-Irish stock, inheriting the traditions and temper of colonial times; the government unevenly administered; the people intense in family loyalty; a large part of the population constantly familiar with the sight and use of weapons. In a word, it is "a belated frontier."

To this we must add the fact of actual cases in which self-defense has been the highest duty.

In a neighboring county seat one of the most peaceable and honored citizens is a man with a history. Quite against his will, he became a party in one of the worst feuds that Kentucky ever knew. Local authority surrendered to the renegades, and he witnessed the slaughter of

neighbors, friends and relatives. One good citizen after another suddenly went West because a notorious fighter had notified him that a funeral was billed for such a day, when he was to take a prominent part. At last such a notice came to this man himself. The courts had no courage. The bold outlaw and his assassins had the support of the sheriff and officers, and got possession of the town. They were the court, the judge, and the jury. The man could not stay at home. He appealed to the Governor of the State, but the Governor said his hands were tied because certain forms of law had not been fulfilled. The man took the train from Frankfort to Cincinnati. His last words were: "Governor, I have but one home and one fireside. From these I have been driven by these outlaws and their friends. They have murdered my kinsmen and are threatening me. I have never engaged in any of these contentions, and now I propose to take a hand and recapture my fireside or die in the attempt." He bought several hundred dollars' worth of the munitions of war

RELIGION FINDS ITS BEST CHANCE IN SUMMER
The mountaineers are today Baptists for the most part

MOUNTAIN GIRLS AT BEREA

All these college girls are Daughters of the Revolution

and had them shipped to a friend at an out-of-the-way station as saw-mill fixtures to avoid suspicion. His plans were perfected before the outlaws found them out. When the fight came he was deserted by the sheriff, but a faithful few stood with him and returned the fire of their enemies. The battle lasted two hours, and when the smoke cleared away the band of ruffians was "cleaned out." Our hero resumed the arts of peace, and there has never been another serious feud in that vicinity.

The relation of liquor to fighting is well recognized in the mountains, and while the good citizens have not found themselves able to suppress the fighting, they have greatly diminished it by suppressing all open saloons. Moonshine stills, of course, exist, and it is sometimes whispered that the revenue officers are not anxious wholly to suppress them. A desultory warfare goes on between the "stillers" and the "revenues." Every mountain mother has days of anxiety at Christmas and election times when there is liable to be "a run" of whisky in almost any valley. Such starting of whisky

almost always precedes the rekindling of an old feud.

The starting of a feud in any mountain county of Kentucky, or the adjoining States, is almost sure to increase the number of students at Berea. Parents who understand but little of the value of education hasten their sons off to Berea to get them out of harm's way! It is not uncommon for such a lad to bring his revolver with him, and I frequently open a teacher's drawer and find one or more of these weapons "on deposit." We have no students from Carroll County, Virginia, though we have several from adjoining counties.

But such things are really of the past in the mountains. Every mountain man will tell you today that "the feuds are dying out." Government grows better, intelligence spreads, the voice of religion is heard, commercial interests assert themselves, and the schoolmaster is abroad.

Let it be repeated that there is probably no mountain county in which 10 per cent. of the population have ever been engaged in these lawless proceedings.

The mass of the population is made up of simple, primitive people, showing the strong traits of their race—independence, respect for religion, family affection, patriotism.

And in spite of all untoward signs, these three million people are a glorious national asset. They are the unspoiled and vigorous reserve forces. They will offset the undesirable foreign elements, and give the South what it has always lacked, a sturdy middle class. There is still a pitiful lack of material resources—the average value of utensils on a mountain farm is less than forty dollars—and an appalling illiteracy. But illiteracy is not fatal and it can be cured. In the Civil War many mountain men received a practical education as they served in the Union Army and marched with Sherman to the sea. While the war no doubt increased for the time being the enmities and feuds, it brought in a beginning of education and a wider intelligence.

Today, after a long pause, there is a renewal of railroad building in the moun-

tains. The incoming of mining operations and lumber camps has at first a deadly influence upon the mountaineer. A circuit judge recently called my attention to two adjoining counties, one as yet untouched by railroad or outside commerce, lying, like a part of Scotland, peacefully in the mountain lap, but slowly progressing thru the sending off of its brighter young people to school. In this county there were about forty cases on the judge's docket. In the adjoining county, where a railroad was under construction and "civilization" breaking loose in various ways, there were six hundred cases.

Change, then, is knocking at the door of every mountain cabin. The mountains must receive new elements, and their population must overflow. The mountain people have the basal elements of strength. They are as promising as were our own ancestors in the days of Elizabeth. But they do need a friendly interpreter and a guiding hand.

BEREA, KENTUCKY.

PLAYTHINGS CONFISCATED AT BEREÄ

De Senectute

BY THE LATE SAMUEL J. BARROWS

WHAT matter if the dial shows
How many years have come and sped,
If in the heart the fire yet glows
That lighted up the days that fled?

Revere the ashes in the urn,
But light the torch of hope again,
And let the gentle fancies burn
That kindle cheer and banish pain.

A thousand genial memories gleam
Along the highways of the past,
And golden friendships brightly beam
Thru clouds that fitting shadows cast

'Tis true: the best is yet to be;
The last for which the first was made,
When hope lights up futurity
And love is in the balance laid.

Moving Pictures of English and American Women

BY MRS. L. H. HARRIS

AUTHOR OF "THE CIRCUIT RIDER'S WIFE," "EVE'S SECOND HUSBAND," ETC.

THE English woman is not the most intelligent, but she is by all odds the most important woman in the Old World. With less brains than either the French or German women, she is doing more for herself. At the same time, the word female applies more accurately to her than it does to the women of any other nation, not even excepting those little, round, fat vowels of humanity, the Spanish señoras and señoritas. Altho she is trying hard to share the duties of men in public life, she thinks and acts in terms that are fiercely and temperamentally feminine. She illustrates more nearly than any other woman the truth of Rudyard Kipling's latest famous line,

"For the female of the species is more deadly than the male."

Nothing is more remarkable in the psychology of modern life than the manner in which she is now dramatizing her aboriginal fierceness in her effort to become a factor in the public life of the nation. The virago methods she has adopted to get her civil rights are not so necessary as they are the natural expression of her unexpurgated and ferocious femininity. She fights, breaks windows, and slaps men's faces by way of aspiring to citizenship because she is simply the deadly female of that British species. American suffragists can make no greater mistake than to imitate her in these methods, for this reason: The Englishman has never demanded anything else of his women but that they shall be merely feminine and sacred to him. He neither humors nor honors them as American men humor and honor American women. Therefore, when the English women escape into this new ambition for political rights, they instinctively preserve their primitive type in the way they go about it. They contend with their claws against their mates,

who they believe have misused them. But the American suffragist has another proposition altogether to face. She has not been misused so much as she has been pampered too much. She is losing caste more thru indulgence than thru abuse. She must, therefore, destroy the ideality of American men in regard to women before she can bring them to see the justice and necessity of her demand for the ballot. On the other hand, your British John Bull has never indulged in any ideality about his women. He respects no one but himself, reveres no one else, and loves himself with a fidelity and a romantic ideality which he could never bestow upon a mere woman. Thus, the English women lose nothing in their shrewish battle for suffrage, because they have nothing to lose, while the American woman has, and must make a choice. If she pursues methods which cost her the ideality and adoration of her mankind, she will have lost more that is necessary to her peace and happiness than the ballot may ever pay in political dividends.

The picture of a round-shouldered, corsetless English suffragist in an ugly, patched, polka-dot sateen waist and flip-flop skirt standing before a street crowd or leading a mob is a monstrosity we ought to consider before we follow her example.

But the English woman is not only the italicized woman in the Old World because of the elongated and somewhat distorted shadow she is now casting upon the public highways of political life. She is at the same time the only foreign missionary club woman in the world. The Lyceum Club of London has branches in Paris, Florence and Rome. They have their own quarters, boards of governors, and are conducted exactly as men conduct theirs. The members smoke, read the papers, caucus, gossip and receive their mail, and often live in

them. But here the imitation of the male ends, and the characteristics of the more deadly female begin. English club women are quarrelsome, furiously jealous of other members of the club, and they are mistresses of the art of backbiting the women at the next table. They are never embarrassed even when they haggle over the bill for refreshments which you have just taken with them. Their astonishing shamelessness in exhibiting the worst of their dispositions to each other is very different from the suavity of American women. We kindly save the worst we have to say of each other until the victim is absent. But an English woman prefers to say it to your face and to emphasize it with the snapping sharpening of her features in your direction. And the picture of her standing thus with her neck feathers ruffled is the most lasting impression an astute observer takes with her of the English club woman.

Meanwhile, it is owing entirely to where you meet them what impression you receive of them socially. On the Continent the English woman is the most gracious and courteous woman in the Old World, tho, of course, never the most charming. Away from home they are never self-assertive. They put their best foot foremost. Every one of them might be a diplomat with a treaty in her pocket which she hopes to get signed by being extremely agreeable. This is the difference between her and some American women, who do not always take their best manners with them when they cross the Atlantic. The Old World is full of stories of their impudence and extravagance. This arises from two causes. First, when the American woman actually realizes how small the average empire or republic in the Old World is compared with her own, when she comprehends how far ahead this country is, how much out of date these older nations are when one considers the bulk of their population, she becomes an eaglomaniac. Second, American women in particular have a rôle assigned them. They are expected to be extravagant and egregious, and a good many of them act upon the suggestion and even surpass expectations. Meanwhile, my English lady abroad continues to practise frugality,

purrs out the prettiest kind of small talk in a voice so trained up and down, so sweetened and softened that her conversation becomes snatches of an engaging and complimentary ballad. The queer thing is that the same outrageous American woman is a lady at home; and the same English woman at home, surrounded by her insufferable traditions and in the shadow of her Westminster Abbey, is a kind of social tartar. And she is especially deadly if an American woman happens to be within range of her prejudice. The common explanation of her antagonism to the women of this country is jealousy, but her dislike goes deeper than mere jealousy. It is really the antipathy and impatience that a finished being has for one in the making. The English woman is complete, and the American woman is scarcely sketched in yet. We are merely potential. The wife of an English professor at Oxford said to the author quite naively one day that when she saw a party of American women "sight-seeing about the university, she always felt outraged and indignant, as if a sacrilege was being committed."

"But why?"

"I do not know," she replied; "it is a feeling."

The feeling she could not explain was that of having her dead disturbed and stared at by eyes connected with new, keenly alive and irreverent American faculties. The dead in England are not only the dust of many men and women, but also the atrophied customs of these people, honorable enough, tho hardened into a bondage of mind and spirit which a gadding American tourist is not likely to appreciate properly.

The picture of the English woman in society, formal, correct, narrowed in consciousness to that partial gentility which recognizes her own kind, but no other kind, is that of the same "deadly female" embalmed in a medieval egotism as grotesque as it is offensive.

The American woman is a novelty—as much a novelty in human nature as any of Burbank's experiments in mixt vegetation. She should be labeled "The Burbank Woman." There is no other like her. She is not exotic, but she is not yet sufficiently hardy to be called indigenous. This requires some explana-

tion when one considers that the American man has produced a type as distinct and clear cut as that of the ancient Roman, which, indeed, it is said to resemble. But one cannot find a single woman, or statue of a goddess, or picture of a pagan or a madonna in the Old World to which American women bear the slightest resemblance. They have the straight shoulders and spirited carriage of pretty warriors, but they are physically frail, like new plants that have no deep roots in the soil of life. They have no definite fashion of being even beautiful or homely as the women of other nations have. Thus, a beautiful English woman always has regular features and a drooping feather expression. An ugly one invariably has a miniature chin, a perch pulled mouth, an ungainly nose, squinted at the corners by a "sun-smile" which narrows the top of her face. And she has the figure of a writhing worm which is doubtful about erecting itself. A beautiful German woman looks large and sweet and dim, like glory with a veil over its face. And the ugly ones have countenances so grave and strong and homely that they are like the firm foundations of the nation walking about. The French women are rarely ever beautiful at all. They merely have the same radiant expression which conceals their almost universal lack of beauty. But the American woman, with a sallow complexion, features that antagonize one another, eyes that do not match her brows, can and often does manage to be beautiful. Or she can be homely without managing. One day she is a rose, pale and sweet; the next she is a cactus, arid desert to the bone. But she has no fixt standard of appearance as women of other nations have, no resemblance one to another.

And this is a queer circumstance when you come to think about it. For a hundred years ago there was an American woman of a definite type and possessed of a definite character. She was healthy and vigorous and happy, because she lived side by side with her husband and worked with him to make this nation what it was then. Now she is not healthy and she is not happy. She is the victim of neurasthenia, opulence and operations. She has more liberty, more

luxury, more leisure than the women of any nation in the Old World, but she has far less strength or endurance. This is due partly to our too stimulating climate, partly to a system of education which fits her better for public life than it does for domesticity, being, in fact, the same kind of education that men receive. But the chief explanation of her fragile physique and irritable unrest is that spoiled women no less than spoiled children are rarely healthy or happy. And the American woman has been humored too much. She is the hybrid of culture and extravagance without roots in the civilization, when she is not the overworked victim of its factories and shops. She belongs to the hothouse of human horticulture, which no longer thrives in the proper exposed places where the forces of nature always destroy a growth or make it indigenous.

The fact is that class of American women who should exercise the greatest influence upon the life of our times have now lost their place in the order of things. They are the largest irresponsible, unemployed class in the world, rendered idle and extravagant by the great increase in wealth and because so many manufactories and industries of one sort and another have deprived them of their former household duties and of the natural means for a moral livelihood. They have become the most enormous and astonishing example of arrested development in the history of the human race, arrested by idleness and luxury. There is today the distance of a hundred years between the average American man and the average American woman—a gap that never existed before, because poverty kept them yoked together in the same effort to earn and to save. Their downfall began when the men could afford to provide servants, immense houses for them that were no longer homes, and all the lavish extravagances which characterize their entertainments and adornments in social life. They are directly responsible for most of the richest manufactories in the world, where only luxuries and not necessities are made. Most of the things sold in the largest stores are vanities, and most of the people who buy them are women who do not work. This is a picture of the American woman which may be seen moving anywhere in

the Old or New World, a creature too delicate to be of much service, expensively clothed, doing nothing for herself that a servant can do for her.

But she cannot persist in doing wrong without paying for it. This is the one debt she pays, not her husband nor her father. And the price is that the American man is becoming impatient. His whole attitude is changing toward her. He is beginning to observe her coolly, critically, estimating what she costs and what she does not pay. He is slow to marry her, much slower than he was a hundred years ago. So far he has accorded her a respect and a reverence which is absolutely incredible to men in the Old World, but already the change is begun. You see everywhere, in the comic supplement, on the humorous page of current literature in this country, the caricature of women, the growing contempt of men for them.

This is the secret of the coal of fire in my lady's back which is causing that curious migration she is making out of beautiful innocuous privacy into the woman's movement. She must do something to reinstate herself in the order of things. You may hear on all sides that she is getting up and dusting for her rights, to demand better protection in

the laws, equal suffrage, and I know not what else, but the real explanation is that she is beginning to realize the lessening love and respect of men. This is sobering her and causing her to look about to see what can be done to earn a new and respectable character. Naturally, she covers her advance by laying the blame upon men. It takes considerable growth in grace to confess one's own fault, it really looks better to confess the other fellow's, so she is telling all the bad things that men do and ever shall do as an excuse for this movement after her rights. But the truth is, she has discovered that she is no longer an active principle in the life of the nation, merely an orchid Eve in an orchid Eden, and she is making an effort to follow Adam outside, where there is a decent and indecent amount of digging going on, and where she desires again to find herself by his side, where she belongs, not where she is. This is the latest moving picture of the American woman, a wayfaring lady with her little Pandora box of frailties under one arm, her pretty skirts tucked under the other, making a sort of pious pilgrimage in the direction of the polls and the ballot box with the hope of meeting *him* there.

NASHVILLE, TENN.

The Tourist Industry in Bermuda

BY GARDNER RICHARDSON

AN interesting experiment in using the tourist as a means of building up the prosperity of a community has been tried in Bermuda. Before the Boer war the island enjoyed prosperous conditions commercially and financially. The British Government quartered, as a rule, two regiments of infantry, a battery of artillery and a company of engineers on the island. In addition, an extensive naval repair station and dock yard was maintained. The pay of the officers and soldiers, as well as the expense of maintenance, was a large and steady income to the island. The agricultural situation

was also most satisfactory. Large quantities of Bermuda lilies and onions were exported at profitable rates. The height of the island's prosperity was reached during the Boer war, when over 6,000 Boer prisoners were quartered in Bermuda. The expense of feeding the prisoners and the maintenance of additional troops for guards all contributed to the income of the island.

From the close of the Boer war in 1902 conditions began to change. First, the large number of prisoners were entirely removed, and the British Government began a policy of retrenchment that seri-

ously affected the income of the community. One regiment was withdrawn and the dock yard force reduced by 500 men, who were immediately thrown out of an employment that had supported them for a lifetime. In addition to this the State of Texas began growing onions both more cheaply and in larger quantities than Bermuda. The import tax on foreign vegetables made the competition with Texas even more difficult for Bermuda. The lily crops, at all times precarious, suffered several bad years. At this time, with the two principal sources of revenue greatly reduced, Bermuda turned to the tourist trade for financial relief.

The exact figures are not available, but few tourists visited Bermuda before 1890, and until 1905 the number was probably less than 1,000 a year. The local government, after a few experiments, started in 1908 to actively legislate and encourage in every way possible the tourist trade. The accompanying table shows how in four years the number of tourists increased over four times.

It soon became evident that, while the winter season was popular, the summer season showed a decided falling off. This necessitated the closing of hotels and stores that depended on the tourist trade, with a consequent loss of income to the island. To meet this situation the Quebec Steamship Company offered to keep the steamer "Bermudian" on a weekly service during the summer, provided a subsidy of \$30,000 for three years was granted. The legislature of Bermuda, after carefully discussing the matter, decided to grant a subsidy of \$22,500 for the first year and \$17,500 for the second year. This was intended to recompense the Quebec Steamship Company for running a large steamer during the dull season. How well this subsidy worked can

be seen by the increase from 182 tourists in August, 1908, to 2,460 tourists in August, 1911. It is conceded in Bermuda that this was one of the best things the legislature ever did.

It is estimated that the average tourist spends \$100 in visiting Bermuda. Very few spend less than \$25, while some who stay for an extended visit at an expensive hotel greatly increase the average. At \$100 apiece \$2,704,500 would have been brought to Bermuda in 1911 by tourists.

The revenue of the island has steadily increased with the increase in the number of tourists. In 1908 the total revenue was \$285,000, in 1909 it was \$345,000, in 1910 it was \$392,500, and in 1911,

after very considerable reductions in the tariff, the revenue amounted to \$395,000. In 1909 the balance in the Bermuda treasury was \$2,900, and in March, 1912, the balance was over \$100,000. As a result of the increase in revenue and general prosperity of the island, the Bermuda government has built and paid for, out of

current revenues, the dredge "King George" at a cost of \$150,000, has invested \$100,000 to defray the cost of dredging operations, and holds a surplus of over \$100,000. This represents a surplus revenue, above all expenses, of \$350,000 collected in three years.

The arrival of the tourist has not only enormously increased the trade of the small shops that sell souvenirs, postcards and photographs, but benefits all the local industries. The 500 men who were thrown out of employment by the closing of the dockyard, have found profitable employment as carriage drivers and porters in the hotels. While the aristocracy of Bermuda cannot view but with regret this invasion of their island home, they have come to realize that their future prosperity largely depends upon the continuation of the tourist trade.

Planning a Flower Garden

BY JESSIE PEABODY FROTHINGHAM

AUTHOR OF "SEA VOICES OF SEVEN SHORES," "RUNNING THE GAUNTLET," ETC.

PENCIL, paper, a foot measure, and a little imagination are all the implements we need to plan our garden.

Gardens that grow, border by border, and develop year by year, are the most successful; they are individual, grow as we grow, have a meaning—they mean us. Like books and pictures, they express our personality, and would miss their subtlest charm if ready-made. They are an eye, a window through which the world may see our taste, love, likings—the metal of our mind, whether we are commonplace or inspired, imitators or creators.

At the start, we may distrust our amateur knowledge, and prefer to depend on professional experience. But, if we love flowers, sooner or later that first draft of a garden will be modified to suit our individual taste and to express our predilection.

The smallest garden must have a plan, even if the plan is modified or developed

in process of growth. And the first element in a successfully planned garden is congruity. The style of the garden must agree with the style of the house, and should be adapted to the size, situation, and surroundings of the lot, to the lay of the land, the climate and soil.

An Italian garden or a Japanese garden would be incongruous as the ante-room to a severe or austere Colonial house. A formal garden needs space and background; in miniature it becomes stiff and meaningless. A restricted area should be treated in a picturesque way; formal planting would merely emphasize its limitations, instead of concealing them.

It is the small lot of the country town or suburb that cries out emphatically for attention, that is least understood, most common, most American, most neglected, and abandoned to the fatal grip of the commonplace. The neat grass yard, the narrow, straight walk to the immaculate front door, the bare walls of the frame.

A WAYSIDE COTTAGE IN IRELAND

Its beauty derives in part from its vines and green background

fancy, or fantastic house, have ruined the reputation of the suburb. The word "suburb" ought to conjure up a picture of rural loveliness, instead of ugliness, and towns like Bryn Mawr prove to us that it is possible to make a country town a place of charm and beauty.

To every one living outside the brick and stone limits of a city, I would say, have a garden, and whether it covers twelve feet or twelve acres, let it be original—not in the sense of being eccentric, fantastic, or grotesque, but of being individual and significant. If the lot is too small for a garden, then plant the front yard and back yard, and make them as picturesque as the wayside cottages of Ireland and Wales. Any house may be made less ordinary, and any land more interesting by planting. And even the back yard of a city house may be transformed into a hidden garden.

In planning for a garden, lay out first the main features of the place or lot. With paper and pencil, mark where the house stands, or is to stand, the walks, driveways, entrance, and boundary line; indicate where the clothes yard and loam heap are to be placed; the vegetable garden, perhaps, and the stable, garage, or outhouses. It will be a help to make the map* to scale.

When these main points are settled, stand mentally and imaginatively on the spot that marks your house, which is the pivot or easel, so to speak, from which you work, the point of view from which you look at the picture. Then start from the outside lines to compose your picture, working inwards. Plant the boundaries, marking where you will set out shrubs, trees, and vines, and write the names of the varieties you decide to have, so as to make good color combinations, and succession of bloom. The advantage of using a pencil is that you will change the plan as you work, erase some names and substitute others.

Now that you have sketched in an irregular and broken line of foliage and flowering plants for the background, you can fill in the foreground. But remember that if you have a good distant view on any side of your lot you will want low planting on that side, or open vistas left between the shrubbery. Never shut yourself in from a beautiful outlook; do

ANOTHER IRISH COTTAGE

Except for the flower pots beside the path the planting is well arranged and effective

not make your horizon any narrower than is necessary. But if circumstance and neighboring houses shut you in perforce, then retaliate genially and amiably by planting them out of your line of vision; privacy you must have, if not the large privacy of nature, then the restricted privacy of your fig-tree.

On at least one side of the house leave an open sward of grass; keep the center free, and this will give a sense of freedom and expanse; mass the planting around the edges of the open lawn.

The flower borders will follow the background of foliage or fence; you may then work inwards with beds banked in green, but always keep as much as possible the idea of space and of vistas into something beyond, if not into the open country, then into a close or cover of your own garden. This gives perspective.

Next you will mark the paths, if there are to be any, and lay out the border planting for the drives and walks. Turf paths are the most effective and harmonious; cut your lawn and garden as little as possible by the hard, white lines of gravel walks. And then you will arrange to plant out the back door, service road, garage, clothes yard, and other unesthetic parts of your establishment which you want eliminated from view. To hide them from both the house and the street will claim considerable ingenuity, so that your intention may not be too palpable, or the screen too stiff and solid. The trees, shrubs, and vines intended to disguise what is behind may be used as a background and framework for flowers.

The last touch to be added to your garden map will be the planting close to the house; but this will be one of the first pieces of garden work to start when you begin digging in March.

Here, then, are the four main steps you will take: first enclose the lot, next plant close to the house, then around the boundary lines, and last between the boundary and the house.

This plan is adapted to the usual lot in a country town, two hundred feet deep by fifty to two or three hundred feet wide. And if there are any old trees standing on the lot, you are to be congratulated. Cherish, hoard and protect them as you would a fortune.

A garden, to be a real garden, must be enclosed, entered by a gate, if not tangible, then imaginary, and opened by an equally mythical key. In other words, a garden must have the qualities of privacy, mystery, and seclusion. On a large place or park the garden alone may be shut in—the ideal arrangement. But the majority of us must adapt our ideals to a small plot of ground, and enclose the whole space, including house and other buildings. Before starting a garden, then, we must plan our enclosure.

A few years ago I would have challenged dislike, disapproval, or disfavor, by the mere mention in this democratic land of that obnoxious word "wall," and I will not define the feelings created by our own shingled enclosure when first it rose to a height of six feet. Happily, those feelings have since disappeared, to be replaced by sentiments of an oppo-

site nature. For the wall has "proved itself."

But there is one advantage that fences and hedges have over walls—they do not irritate the public by a too conspicuous and candid desire to be private; they do not create criticism, for a transparent aloofness is less aggressive than an impenetrable aloofness, and a privacy, I had almost said a propriety, of four years' growth seems to be less offensive than one of four weeks. Probably the sudden appearance of an Athena, full-armed and full-grown, among us would be resented, since we were once obliged to wear swaddling clothes. But if the public demands a dead-level, then we must renounce gardens.

There is nothing that flowers love better than a wall, or a screen; it protects them from wind and cold, their blooms are larger, their colors more vivid against the dark green of the hedge, or the warm tints of the wall.

What we select for our enclosure must depend on the extent of our ground and size of our house; congruity should decide the material. It may be stone or brick or stucco, according to the material of the house; or it may be a shingled wall, if the house is shingled. All but the wooden wall will be covered with vines, ivy, clematis, honeysuckle. With a wooden enclosure, the vines must be trained on wire netting, or poles set close to the wall, but not on the wall itself. For this reason a stone wall may be made more picturesque on the street side, than one of shingles.

Around a fifty or one hundred foot lot a hedge or fence is the most appropriate enclosure. Privet may be taken out of the ordinary and become almost distinguished by proper cutting and clipping. Cut it round-topped, like Box, or let it spread in a wide flare at the bottom, and clip it to a sharp edge on top, like a triangle standing on its base. Three to five feet is a good height. If a wall-effect is wanted, flat on the sides and top, cut the privet to the ground one or two years after planting, so that it will throw up strong shoots from the bottom; if it is afterward trimmed flat on the sides twice a year it will form a solid wall.

Ibota, Japanese privet, is the hardiest of all the varieties, and succeeds in the North and Northwest. Regel's variety

of the *Ibota* is drooping in habit, and if left untrimmed makes a graceful, free-growing hedge. Strong, two-year-old plants, two to three feet high, sell for ten to fifteen dollars per hundred.* They may be planted in a single row, eighteen inches apart, which makes them no more expensive, for a hedge, than the California privet.

Box should be kept for edging beds and walks in a formal garden. The price

hardy screen, feathery and graceful, and keeps its beauty longer than the Norway spruce; it is, in fact, the most beautiful of the evergreens for hedges. Trees from one and a half to two and a half feet are quoted at twenty-five to thirty-five and fifty dollars per hundred.† Costing half this price is the American Arbor-Vitæ (*Thuja occidentalis*), slim and upright growing. It makes a thin, straight hedge, and is useful where a flat

PICTURESQUE PLANTING AT COMO—AN EFFECTIVE NARROW FRONTAGE

varies from five dollars per hundred for small six-inch plants to thirty-five cents and seventy-five cents for single plants two to three feet high. These larger bushes, especially those of variegated green and yellow foliage, are effective when used to mark the corners and ends of formal beds, or of the lower box edging.

For an evergreen hedge, the hemlock (*Abies* or *Tsuga Canadensis*) is one of the most satisfactory; it makes a dense,

barrier or wind-break is needed, but it has a tendency to die out or grow spindling.

The white spruce makes an effective wind-break, and the dwarf Austrian pine is also good for bushy low shields, although forty years is the limit of its beauty; both of these cost the same as hemlock.

In the South the *Euonymus Japonica* (twenty dollars per hundred) is used as

*Elliott Nursery Company, 336 Fourth avenue, Pittsburgh, Pa.; Ellwanger & Barry, Rochester, N. Y.; Thomas Meehan & Sons, Germantown, Philadelphia Pa. (Meehan's *Ibota* Privet is \$17.50 per hundred).

†Ellwanger & Barry, Mt. Hope Nurseries, Rochester, N. Y.; Elliott Nursery Company, Pittsburgh, Pa.; Bloodgood Nurseries, Flushing, N. Y.; Thomas Meehan & Sons, Germantown, Philadelphia, Pa. (\$75 per hundred).

a hedge plant; its glossy green foliage is evergreen.

Several varieties of *Retinospora*, Japanese Cedar, make a beautiful hedge, especially the plumosa, which lends itself to clipping. It is more unusual than Hemlock, and also somewhat more expensive. Uncommon, too, are the Orien-

tal Spruce and Japanese Yew, both hardy evergreens, but scarcely worth the large expense for a hedge. Of these many evergreen hedge plants I would favor Regel's Privet and Hemlock Spruce.

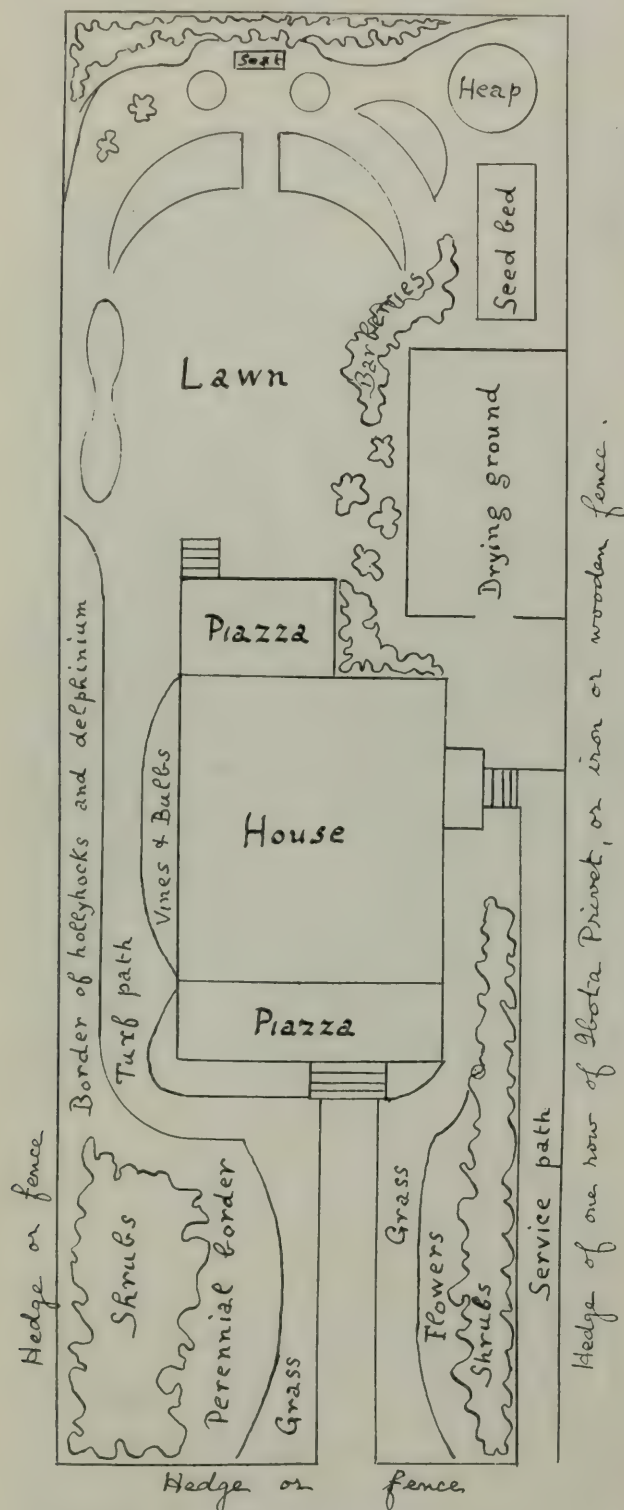

Ornamental, flowering hedges are especially adapted to country houses occupied only from May to November. The *Hydrangea paniculata grandiflora* makes a beautiful, low-growing summer hedge with its luxuriant foliage and its great white heads of bloom, flowering in August and September, and looking like a premature snowbank. They should be cut back, in early April or late March, to about one half of the new growth, and fertilized with bone meal; if planted in a double row (the plants in one row opposite the spaces in the second row), they will form a thick and picturesque low-growing hedge. Our hydrangea hedge in Vermont is two hundred feet long, the double row of plants being set about eighteen inches apart, and the mass of immense, pointed, drooping heads look like driven snow in the moonlight. Plants two to three feet high cost two dollars per ten, or fifteen per hundred. They need no mulching in winter, except a thick layer of well-rotted manure put on in the fall.

The *Rosa rugosa* makes an effective evergreen hedge, with its display of shiny, dark-green foliage, red and white blooms, like wild roses, flowering in July and August, and in the fall large scarlet berries; it is an all-round, versatile, rich-looking plant. The cost is two and a half dollars per ten or fifteen per hundred for strong, two and a half foot plants.†

Spring flowering shrubs may be used for irregular hedges, planted in groups, so that part of the hedge will be in bloom from month to month. Forsythia, *Exochorda grandiflora*, Japanese Quince, Japanese Barberry, lilacs, *Deutzia crenata*, *candidissima* and *gracilis*, Japanese snowball or *Viburnum plicatum*, *Weigela candida*, *Spiræa van Houttei* and *prunifolia*, and *Hibiscus* or *Althea*—some or most of these will make a varied hedge that will bloom from April to September. Medium-sized plants are priced at one and a half dollars to two and a half dollars per ten.

PRINCETON, N. J.

†Bloodgood Nurseries, Flushing, N. Y.

To reduce the expense in planting on this suburban lot, 50x150 feet, omit the flower borders in front, and have only grass and shrubs. Drying ground to be enclosed by 6½ foot poles and wire netting, covered with Hall's honeysuckle, and evergreens in front. Entrance to service path, two 9 foot iron pipes, cross-pieces at top, and chains on sides, for vines, to screen view.

Peace

An Interview with the Author of "The Terrible Meek"

BY MONTROSE J. MOSES

[No modern playwright has done more to depict Christ on the stage than Charles Rann Kennedy, author of "The Servant in the House." His latest play, "The Terrible Meek," interprets Christ as the Prince of Peace. In "The Servant in the House" the main character was Manson, who, in Eastern garb as well as in ethical bearing, symbolized Christ. As the Crucifixion scene in "The Terrible Meek" seems to have created wide comment, we are glad in this, our Easter number, to present Mr. Kennedy's philosophy of Peace and the Bible, which he gave to Mr. Moses in the following interview. In our editorial pages we have a further discussion of the subject.—EDITOR.]

CHARLES RANN KENNEDY, author of "The Servant in the House" and "The Terrible Meek," is a man who knows his Bible well. To him the characters are living person-

ages, showing human excellencies and weaknesses. If they are disregarded, then the vividness of the Bible is lost. When asked whether he thinks it right to reduce some of the dialog of the Bible to the color of cockney speech, Mr. Kennedy retorts by asking in return if his questioner reads the Bible in Greek.

To make of the Bible a living thing is Mr. Kennedy's purpose as a playwright. Fully conscious of the social and economic changes taking place in the world today, he interprets the Bible in terms of modern thought, and modern thought in terms of the Bible. The full force of Mr. Kennedy's method of Bible interpretation was brought in upon me while talking with him regarding the passage in Matthew, "Whosoever shall smite thee on thy right cheek, turn to him the other also." "People do not seem to be able to imagine the expression on the face of Christ when he said this," Mr. Kennedy ventured. "There are not many people who have such a cheek as Christ's to turn."

Now, since Mr. Kennedy goes to the Bible for the true measure of everything, let us see the method he adopts in maintaining his arguments for peace in his new play with the paradoxical title of "The Terrible Meek." This play has

raised a stir not so much for the doctrines it professes to preach as for the use of the crucifixion image, which convention has hitherto debarred from the stage unless it be at Oberammergau.

Some may wonder why, since Mr. Kennedy wished to deal with the problem of peace, he chose the conception of the Crucifixion and of the Resurrection. His answer to this is clear and direct.

"Because, in common with a great many people who are really thinking about this question of peace, I recognize the enormous practical difficulties standing in our way. These difficulties may perhaps be summarized conveniently as stupidity, fear, self-interest, and a narrow, unenlightened form of what is falsely called patriotism. Many effective instruments in the way of propaganda are being employed in the world for the purpose of mitigating these oppositions. The one necessity which is being borne upon me more and more, day by day, the necessity which Ibsen hinted at some fifty years ago, in order to bring about momentous changes desired, is a revolution in the spirit of man. Men's hearts must be changed. This is a *religious* necessity, and I therefore took, not as an abstract, artistic choice, but with the full and fiery conviction of my soul, the central facts of the religion of our Christian civilization, in order to bring home the message I had declared. And I know that God gave me the work to do, and I have the archangels and all the hosts of heaven on my side."

Mr. Kennedy is nothing if not uncompromising on this point. With fire in his eyes, he declares that he is willing to die, to be burned at the stake, to trust his im-

mortal soul to the truth of what he is saying. "I'll let everyone know what it is to have the bowels of belief in you," he declares. "A soul like mine thrives on martyrdom!"

Since man's heart has to be changed in order to bring about peace, it is significant to note how Mr. Kennedy would effect this. He answers:

"By each individual man in the world who professes any kind of brotherly faith, willing away out of his soul forever, following it up by prayer and watchfulness, everything which makes for hate and bitterness against his brothers, especially the brothers of another nation. But this will not be enough. He must stem at its inception, by the same spiritual process, every rankling greed, every opportunity for commercial self-interest of the inordinate kind, hoping in his heart for the day when every kind will disappear. This is all so perfectly simple—such an obviously easy thing to do; and it is already practised so largely by the best elements in all communities, that it is a wonder to me respectable and clever people cannot see it. Anyway, it is the meaning of their religion, and if they don't see it, let them proclaim themselves frankly as infidels, so that we may respect them."

Tho in this conception, Mr. Kennedy has regard only for the individual, he is as serious in his proposals for nations. It is equally as simple a matter for them.

"Simple if they can really get their view properly represented. Just at present the views of the self-interested little oligarchies ruling the nations, especially the so-called democratic ones, prevent the real opinions of the people from being expressed. But even here there is at last some sign of hope, whether this be the result of conviction or the dawning of a wholesome fear, I do not pretend to determine. But the light is coming, even in these unexpected places of the earth."

In a consideration of the problem of peace, Mr. Kennedy would have everyone read Angell's "The Great Illusion." This he considers to be one of the monumental and common-sense documents of the world. Supposedly written from what people consider to be an enlightened self-interest point of view, Mr. Angell makes no special appeal to the mystical,

imaginative or religious side of life. He adheres strictly to his practical and business-like thesis. As Mr. Kennedy puts it: "After all, the matter, as a mere question of systematic arrangement, requires no more gumption than may be possessed by an order-loving greengrocer. It seems a wonder to me that all the clever business people cannot see this. I don't say this satirically, but I do wish business men could get a little more imagination and faith into their constitution; it would do them so much good. I have tried to supply this want by my play."

Now, the natural question that arises is whether Mr. Kennedy would include diplomatists among the business men he mentions, for diplomacy has much to do with this problem of peace. His arguments upon this point are as pronounced as any he holds, and he states them in this manner:

"Diplomatists are the worst kind of business men. The horrible thing that has happened lately in the little oligarchies I have mentioned is the transformation of the old-fashioned diplomat into a shopkeeper. I suppose it is all part of the process whereby the old-fashioned gentleman gave place to the new-fashioned cad who still clings humorously to the noble title. I have no particular brief to hold for the gentleman as such, even the old-fashioned sort. I was unfortunate enough to be brought up a gentleman, but I have repented. Only I do recognize that the old kind of gentleman, tho he was prejudiced and a little too self-sufficient in the objectionable way, did have some sense of responsibility towards other people, which meant among other things the very proper sacrifice of himself. Your modern shopkeeper gentleman never seems to have dreamed of this, as you may gather, for instance, from reading the patriotic ebullitions of the *London Daily Mail*, Lord Northcliffe's mouthpiece.

"I mention this fact because I distinguish very clearly between the old-fashioned forms of nationalism, imperialism, and the rest of it, and the modern doctrines proclaimed in their name. In those old days, 'God Save the King,' the waving of bunting, and the name of God really did have some meaning when

employed at moments of national enthusiasm. Today, they produce nothing but an uncomfortable feeling among enlightened persons that sacred instincts are being rather blatantly employed by money-loving-country, dishonoring swindlers out for dividends. Surely it is about time that the real old-fashioned gentlemen of the world, if there be any left, which I doubt, should join with those very much more important people, the really alive men and women who are making things, to prevent the countries they are supposed to love becoming a field of carnage for the enrichment of a few ogres who have lost the image of God in their souls. And we might begin by inventing a new sort of diplomat, somebody who really believes in God, loves his fellows, and understands that common-sense, rightly applied in the proper places, is worth volumes of erudition derived from the pages of Machiavelli."

The peace upheld by Christ did not gain headway without many centuries of revolution. There are some who argue that it will not now maintain itself without struggle of a militant character.

"When we say this," declared Mr. Kennedy, "we refer to peace considered within the boundaries of a country itself. It is analogous to the similar doctrine proclaimed by war-lords of an international peace by dreadnoughts and armaments generally. Only I find that these gentlemen, whilst they taboo the one as unnatural and unpatriotic, exalt the other as something really rather commissioned by Almighty God.

"As a matter of fact, the latter has only too often been less excusable than the former. Civil revolution has often only been the expression of a wild and oppressed despair; whilst the other has nearly always been the expression of oppressors' greed and rapacity. However this may be, there is a new conception of revolution now in the air, and, indeed, quite an appreciable quantity of it already practically realized on the earth: the peaceful revolution by common-sense and ballot-box. Just how quickly this realization may spread in the immediate future, as against the bloody-minded doctrines of the war-lords, will perhaps answer the further question invoked as to whether the older ... more terrible

form of revolution is banished from the world forever. It is a terrible thought and a spiritual one. I tried to awaken it in 'The Terrible Meek.'"

Notwithstanding this argument, the budgets are increasing on the side of war expenditure. Yet Mr. Kennedy regards this as no refutation of the peace problem. He says:

"It is the last despair and infidelity of the propertied classes who are pioneering them. They are no expression whatsoever of the great bulk of the people whom they are impoverishing to the point of another and more terrible despair. The uselessness of these preparations may be perceived when we consider just for one moment the hint afforded us from the workers of the world during the last few weeks. We need only ask ourselves one question with regard to dreadnoughts, with all their battalioned horrors of death and torment: What are they going to do without coal if the miners in all countries decide that they shall not have it?"

As a matter of referring the discussion of peace to some historical fact, Christ's doctrine certainly had effect upon the condition of the Roman Empire. It came as a quick thing amidst the feeble light of something about to disappear.

"In fact," Mr. Kennedy suggested, "the Roman Empire was already a dead thing. It still gibbered and made faces as ghosts will, not quite knowing itself dead, but meanwhile a miracle, in a restricted area, it is true, was taking place, and during the next three centuries the area widened, including practically the whole western world. That miracle was the miracle which is at least a commonplace of thought with us today, actually realized in the best hearts amongst us—the miracle of a true, a practical, and a common-sense democracy. It has taken many centuries for the democratic idea to gain ground, but it is coming right enough. I wonder whether any healthy American or Englishman or German or Frenchman is prepared to deny that doctrine."

Granting, therefore, that the doctrine of peace has gained a headway in the hearts of most people, is it being rightly preached in the channels where it has the best right to be preached? Are the churches preaching the gospel of peace

in the spiritual rather than the doctrinal sense of the word?

On this point Mr. Kennedy's enthusiasm is warm.

"Verily," he exclaimed, "they are beginning to interpret Christ the Carpenter, the butchered Son of God, more and more in the realistic, first terms of His appearance—losing none of His divinity thereby—and less and less in terms of the stained-glass window. Not that there wasn't a beauty about the stained-glass window, but it was an exotic, other sort of beauty to be guarded against at all points lest it should pass into mere estheticism and sentimentality. The strong Son of God in the Gospels, the Man who knew He was One with the Father—the keen-witted, tender, ironic, even humorous and divinely pitiful Jew, who knew Himself God walking on the earth—is coming back into this world, believe me.

"The Bible happens to be a living Book, dealing with actual, not romantic persons—persons very much like you and me, our mothers, our sisters, our brothers. And I happen to be a dramatist. So, when I read the dialogue of the Pharisees and Sadducees, I seem to have heard their tone of voice before, sometimes in cathedrals. I hear soldiers talking and behaving very much in the same accents, very much with the same blood-thirstiness, as they did over that little matter of the crown of thorns. I can

still see common people hearing gladly the words of truth; I can still see the wealthy, the idle, the pleasure-loving invoking their religion for the commital of deeds of shame. I can still see empire-building blackening the face of the sky. I can still hear the pitiful anguish of mothers of the world who have given themselves to the ministering of life only to be overwhelmed by the bitter forces that make for destruction and for death.

"That's why when I read my Bible that's why when I wrote my play, 'The Terrible Meek,' my common soldier talks a kind of cockney; he was a cockney there in ancient Rome. That's why my centurion talks like any English gentleman; he was an English gentleman there in ancient Rome. That's why my Virgin cries out the woes of the mothers of modern workers in South Wales, in Westphalia, in Lawrence, Mass. And when I read my Bible I seem to see Christ not dead but risen, standing here now in our midst. I believe He has a message for the world today with respect to the peace agitation now going on. I am one of those who have declared that message. He made me declare it, Christ standing in our midst. Do you think I am going to make myself a liar before God and man by watering this down, by compromising doubt? Not if people know the stuff I'm made of."

NEW YORK CITY.

The Need of Commercial Education

BY GEORGE P. BRETT

[Mr. Brett is the president of the great book publishing house of The Macmillan Company. As chairman of the Committee on Commercial Education of the Chamber of Commerce of the State of New York, he has made a special study of commercial education, the needs of which are set forth in the following article.—EDITOR.]

CHANCE may be described in one sense of the word as the foe of primitive peoples, and the progress of civilization may be said to be measured by the extent to which chance has been eliminated in our never-ceasing struggle with the forces of nature. In the now dim dawn of human life on the earth came the chance of pestilence, came the chance of bad harvests, and the peo-

ple perished. Today we have progressed far from these primitive conditions and we are living in a time and in a land of surplus, and the chance of plague, of pestilence and of famine has been largely eliminated or very greatly lessened.

It is only in education of our modern institutions that the chance method still for the most part prevails. Here the chance that the education offered will fit

the pupil for his future life's work is still the usual method, and this is particularly true of our elementary school system. The cure of this condition is to be found in making our education practical, which, in the case of our city schools, means commercial education, just as in the case of the country schools it should mean education in agriculture, as we are just beginning in many parts of the country to realize.

It is only within the last few years that the term commercial education has become a familiar one in this country, and even today one may still hear the question—What is *commercial* education? What does it mean?

Just as industrial education or vocational training, as it is sometimes called, may be taken to mean the special education of pupils for industrial and manufacturing trades, so we may define commercial education as a practical education suited to the needs of the present day and intended to fit pupils who will enter commercial business for the work which they will be called upon to do, and will better equip them for their life's work.

Dr. Andrew S. Draper, Commissioner of Education, sums up the situation in our present educational systems when he says: "There is something the matter with the schools. They fail to hold the children. They turn them out illiterate. They fail to prepare them for life."

For the children of our cities, about 90 per cent. of whom leave school at about the age of fourteen and enter business, commercial education is vitally necessary. It is the only way to prepare them for success in their life's work, to give them that practical education for the gaining of a livelihood without which today no boy or girl in our large cities is safe.

In considering any plan for commercial education in our great cities we must not only provide for teaching practical studies in the elementary schools, but also for improving and extending the teaching of commercial education in the secondary schools, and we should also establish a college or university course in commercial education, including in this or in a separate institution facilities for the training of teachers of commercial education, and not only this, but we must, because of our neglect of practical education in the past, provide for the teach-

ing of commercial education in evening schools for those who have been obliged to leave school at the age of fourteen, and for those of more mature age already engaged in business. Society has not discharged its obligation to those compelled to leave school and enter business early unless it offers them free and unlimited opportunity for educational advancement.

For commercial education in the elementary schools the Chamber of Commerce advocates a plan which provides that opportunity shall be given to pupils to begin their commercial education at the age of twelve, after six years of school life, *i. e.*, for those who must leave school at about the age of fourteen. This is the system followed in whole or in part in the public schools of several European countries, and Dr. E. E. Brown, recently United States Commissioner of Education and now Chancellor of New York University, and many other educational authorities, have long advocated such a change in our school system. It would provide that pupils, after the tools of education are acquired at about the age of twelve, should be divided into separate classes, and preferably into separate schools, those who are to leave school at fourteen or fifteen being thereafter required to follow a course of study of which commercial education, *i. e.*, practical studies, shall be the major part.

In the secondary schools something has already been done for commercial education. High schools of commerce and commercial high schools have been established which are active, well managed and attract large numbers of students, more in fact than the existing schools can accommodate, but much more can be done in this direction. In the majority of our high schools the course of study is still modeled on the college entrance examinations, and its inadequacy for the needs of education is proven by the fact that more than half the pupils do not stay in school to complete it. Here the remedy should be simple and easily applied. As only a very small percentage of the high school pupils ever go to college, the great majority beginning their life's work at or before graduation from the high school, a sufficient number of these schools should be set apart for those who will go to college or who

prefer a course of study prepared for such students, and the remaining high schools should become secondary schools in commercial education, *i. e.*, giving such a practical education as will be suited to the needs of the present day and will fit their pupils for their life's career in industry and commerce.

For higher commercial education in the city of New York and in many other of our largest centers of population, much as we may dislike the idea of piling university on university, school on school, when so many institutions of higher learning already exist, we shall be obliged to establish separate colleges of commerce unless we can prevail upon some of the many higher institutions already existing to give us facilities of the broadest and most extensive character for this important subject of higher commercial education. Something in this direction has already been done, but many additional facilities are needed.

Such colleges of commerce must offer courses which will train men for the higher positions in large commercial enterprises, for important places in our large and constantly growing export trade, which require special emphasis on all the commercially important modern languages and on the customs, history and economic conditions of foreign peoples, and courses which will train able men for consular and diplomatic positions and innumerable other requirements, and in addition it must provide for the training of teachers of commercial education for our elementary schools, the lack of such teachers being, as Dr. Maxwell has recently pointed out, the greatest obstacle at present to the introduction of commercial education studies in our elementary school curriculum.

Colleges of commerce properly equipt and established and managed, I hope at any rate in part, by representative men belonging to the chambers of commerce of our large cities, would become centers for commercial education and commercial training for the entire country, and they would exert great influence and play a large part in increasing the future importance and rank of this country in commercial affairs. Not only this, but they would help to bring about more quickly that predominance in the export trade and in the affairs of the

world which is the country's manifest destiny.

I have left myself little space for the other parts of my subject. In the evening schools we have a duty to perform—a real obligation to meet. No boy or girl is safe in this age without a knowledge and training in some employment in which daily bread can be gained. Our civilization has not fulfilled its duties to those who must leave school early unless it provides free and unlimited opportunity for further commercial education—of necessity evening schools must be fitted for two classes of students—those above referred to, who must, perforce, begin work early, and those more matured men and women in business whose needs could probably best be supplied by the evening commercial high school.

Associations of merchants and chambers of commerce ought, I think, to arrange with the educational authorities to be represented at the graduation examinations of those institutions where commercial education is already taught, issuing to successful students, whose school careers are worthy, certificates of proficiency which would be a guarantee to employers of a certain commercial standard attained. Such a plan would be useful alike to merchants, to the pupils and to the schools where the effect upon the pupils still in school, especially on those in the higher grades, should be marked, and such a plan, if properly carried out, would also aid the schools by tending to induce parents to allow their children to remain longer at school, so that they might attain a certificate which would insure their obtaining immediate employment, and of a better sort than is now usually open to the ordinary school graduate.

This plan should be extended, with proper modifications, so as to include all schools giving commercial training as fast as the school authorities provide the needed additional facilities in commercial education.

For the holders of these certificates chambers of commerce or other associations of merchants should provide free employment bureaus, with superintendents in charge who would be capable of giving advice and guidance to applicants in the choosing of a business career.

The Call of the April Brooklet

BY O. WARREN SMITH.

As a rule, the month of sunshine and showers marks the open season for trout fishing. In a number of States the angler must wait until the 15th before he may legally pursue the speckled dandies. A few States even put off the important day until May. But whatever the date, your enthusiastic rodster is found on the banks of his favorite stream bright and early the first day of the season. Not because his chances are any better on that day—indeed, they are often nil—but just because it is “opening day.” In the Badger State, where my shingle creaks in the breeze, I have more than once made my way thru knee-deep snow in order to reach a well-beloved stream on opening day, then for hours waded in water so cold that its chill penetrated heavy hip boots and a multiplicity of woolen socks. Once I fished for three hours in a blinding snowstorm, and filled my creel, too, which was an unusual occurrence so early in the season.

Be it said it is not the fish the angler

catches nor yet expects to catch that takes him to the stream thus early in the spring. Rather it is the insistent call of the open, the lure of God's out o' doors. The nature-loving fisherman is neither a scientist nor a pseudo-scientist, forever asking “why,” eternally seeking explanations; he accepts Nature as he finds her, thanking God for her power to rest the weary heart and smooth out the wrinkles of care with her sadirons of gentle blandishments. He fishes for a good time, and that he takes with him, tho he knows it not.

Withal the angler is a man of “rods, reels and traces,” to borrow a line from one of Kipling's well-known poems, for a goodly portion of his enjoyment comes from the possession of fine tackle. Bless you, you can measure the number of years he has been a worshiper of the “red gods” by the number of rods he possesses—a “Devine,” a “Leonnard,” a “Thomas,” a “Burtis,” a “Cummings,” etc. Then there are reels and reels, and lines and lines, and flies and flies, a trunk full, perhaps a room full, depending upon the length of

YOUR ENTHUSIASTIC RODSTER IS ON THE BANK BRIGHT AND EARLY.

WATER SO COLD THAT ITS CHILL PENETRATES HIP BOOTS AND WOOLEN SOCKS

his pocketbook and the number of years he has bestrode his hobby. No matter how much tackle he possesses, there is one battle scarred rod and reel, neither very costly probably, which he takes with him on opening day for association's sake, and because they "know how to catch trout." Such faith in insentient articles marks the true angler.

According to most of the outdoor magazines the angler uses flies, but the chances are that early in April and sometimes in May a swelling coat pocket marks the presence of a can of plebeian earthworms. Perhaps trout will rise to flies when ice forms along the edges of brooklets and no ephemera on gauzy wings flit above the surface of the water, but the chances are that they won't. Then it is either the ubiquitous worm or a creel guiltless of fish. Theoretically the lineal descendant of Walton marches virtuously home with an empty basket rejoicing in his own virtue, but practically he impales a harmless "garden hackle" on his hook and catches fish. And worm-fishing is as legitimate as fly-fishing, providing the fisherman uses light tackle and gives the trout a chance for its life, which he does if he is an angler. (Note the distinction made between an angler and a fisherman.)

There is something evanescent and elu-

sive about the atmosphere of an April trout stream, but none the less satisfactory because intangible. No angler can put his finger, as it were, upon a certain fact and say, "It is because of this that I love the early fishing." We all know the piquant earth odor of early spring, the sweetly satisfying fragrance of the retiring arbutus, the melody of the robins, bluebirds and meadow larks, the resurrection miracle of the fuzzy willow cats and swelling buds, as well as the thousand and one other items which go to make up a spring day; yet I dare assert it is not one or all of these which makes April and May fishing so attractive, but something found within the heart itself. Oh, these hearts of ours, when we understand them, if we ever do, we will understand why we are anglers and not fishermen. It is what we carry in our hearts to Nature that measures what we bring from her. I am never an infidel during the first four weeks of trout fishing. More than once, as I have followed some whimsical, meandering brooklet in April, I have caught God with His creative work in His hands, upon which some apprehensive meadow lark would shout "Spring o' the year!"

Reader, did you think trout fishing on opening day was a matter of a rod, reel, line and hook? Did you think the sport

was found in a gossamer line ripping thru limpid water, a rod bent into a perilous parabola? Did you think that success meant several shining bodies lying in a moss-lined creel? If you did, allow me to disillusion you, for such is not the fact. Success, the angler's highest success, consists in being en rapport with the out o' doors, and that somehow is more apt to occur when the world is being born anew.

Many a time have I thrown my rod to one side and for long moments stood beneath the wide-reaching branches of some tree in which a flock of robins have been chanting the praises of opening day. Talk about your surplined choirs and famous prima donnas, there is no singer or group of singers that can compare with a single redbreast on fire with the love of spring. What courage and optimism! If I were asked to define optimism, I would say a meadow lark shouting "Spring o' the year" in the midst of an April snowstorm. We April trout fishermen, how often we have seen this "spring o' the year" bird perched on the branch of a tree when the earth was covered with snow and the air alive with

flying flakes, and yet singing at the top of his voice his heartening song.

Perhaps you had thought, with a certain preacher friend of mine, that it is a waste of time to fish. But indeed it is not so. You will be a better man or woman if you become an angler. You remember the advice the old doctor gave preacher Dan—"In life be a fisherman." I hope that my daughter will grow up to be a finished angler, one who knows enough to fish within her own heart for the best of life, and ever remain open-eyed and open-eared toward Nature. If you have not learned to fish with your soul you have never angled. It was Thoreau who said that the wise angler "baited his hook with his heart," and Henry Thoreau knew.

So invest in a rod, reel and creel and go trouting. If you put such things by when you became a man or a woman it was a mistake, which you had better rectify at once. Bless you, you do not need to flirt with old age if you keep the heart young. You weary worldling, with wrinkled brow and trembling hand, hie away to the April trout streams.

DURAND, WIS.

April Song

BY CAROLINE FLETCHER DOLE

[Mrs. Dole, who is the mother of the two authors, Charles F. and Nathan Haskell Dole, has written this poem in her ninety-fifth year.—EDITOR.]

Do I hear the voice of beautiful Spring
Waking from wintry sleep?
Do I hear the whirl of a bluebird's wing
In his flashing onward sweep?

Hark! Is it the note of a robin's song
Calling his wandering mate?
They will build them a tiny nest ere long
And then for the birdlings wait!

I hear the streamlets' musical flow
Released from their icy chain,
As they laugh in the sunshine and onward go
To join in the river's refrain.

There's life and music in all the air,
Soft tints on the tree-tops tall
And swelling buds are everywhere
Presaging the Mayday call.

'Tis the stately goings of Nature's King
We see in the forces abroad:
Flowers mark His footsteps, and fairy Spring
Will his wondrous miracles laud.

NORRIDGEWOCK, ME.

A Leipzig Publisher and His English and American Friends

BY THEODORE STANTON

IN 1887 there appeared at Leipzig, the great publishing center of Germany, a handsome volume which celebrated the fiftieth anniversary of the foundation of the house of Bernard Tauchnitz, the creator of the "Tauchnitz Edition of British and American Authors," so well known to all American travelers on the European Continent. The most interesting part of the book was that containing extracts from the letters written to Baron Tauchnitz by many of these authors, among them Bulwer Lytton, Carlyle, Dickens, Disraeli, George Eliot, Hawthorne, Washington Irving, Longfellow, Macaulay, Thackeray, and Anthony Trollope.

A smaller and supplemental volume, celebrating the seventy-fifth anniversary of the firm, has just been issued, edited by the present Baron, son of the founder, and by Dr. Curt Otto, his partner. Again, the portion of the volume which most attracts the reader is the collection of further extracts from other letters which here appear for the first time. Some of these are worth reproducing.

Among the new Dickens letters are several which touch upon his son Charles, whose name has been frequently mentioned during the recent centennial celebration. Writing from the old Tavistock House, in Covent Garden, where for many years Dickens liked to stop, he says, under date of December 22, 1852:

"My eldest boy, who is now sixteen, I have just taken from Eton (I daresay you know the great public school there, by name) with the intention of sending him to Germany, where I wish him to acquire the language perfectly. He is a clever, well-educated boy and was at first designed for the army; but he has a preference for mercantile pursuits. Now, I wish to place him with some German gentleman, in whose family he would live happily; would obtain a scholarly knowledge of German and French (of the latter he knows a good deal already); would be overlooked and taken care of, as every boy requires to be; and would not lose what he has already learned. I think this would be greatly pref-

erable to sending him to a German university. But I do not know of any such tutor for him, or how, or where, I am likely to find one in whom I could thoroly rely. Is it in your power to help me with your advice and recommendation? Pray forgive my troubling you."

Writing on the 14th of January following, still from the Tavistock House and on the same subject, the tender but sensible father continues:

"While he is well looked after (as all boys require to be) I wish him to be not too obviously restrained, and to have the advantages of cheerful and good society. I want him to have an interest in, and to acquire a knowledge of, the life around him, and to be treated like a gentleman, *tho pampered in nothing*. By punctuality in all things great or small, I set great store"

A letter from London, February 22, 1864, closes with this passage:

"Charley is very well, and sends you his kindest remembrance and regard. He has two daughters, of whom the second was born only two or three days ago."

Several of the letters in this collection contain the estimates of the authors concerning their own works. Some of these judgments may be given. Thus, R. D. Blackmore wrote in May, 1880:

"It appears to me that the perpetuity of my work 'Mary Anerley' is of equal value with the first start thereof; for all my books increase in estimation, as they become more widely known."

From Wilkie Collins in 1856:

"My last story, in three volumes, was called 'Hide and Seek.' It met with greater success here than anything I had previously written."

In 1862:

"I am very glad to hear that 'The Woman in White' has proved successful in your hands. It has largely increased my reputation here."

Ten years' later:

"The sale of 'Miss or Mrs.?' in the *Graphic* newspaper was so large (I believe two hundred thousand copies) that I may perhaps have exhausted my public in England."

Mrs. Craik (Miss Mulock) wrote from Kent in 1874:

"For my books, they are not many now. I have too full a home life. But there is a novelette in one volume now going thru *Good Words*, to be finished in July and I suppose to

appear in June as a book; also, soon after Easter, another one volume tale, 'The Little Lame Prince, a Parable for Old and Young,' a fantastic little book for which I myself have a particular affection."

From George Meredith in 1895:

"Which of my later works to recommend, I do not know. I am told that Russians have a taste for 'One of Our Conquerors.' Here it is not relished. A translation of 'Diana of the Crossways' into German will appear shortly. The lady engaged on the book thinks hopefully about it. The last novel of mine issued is, 'Lord Ormont and His Aminta.' Americans like it. In England opinions are various. There has been recently a publication of my minor pieces, 'The Tale of Chloe and Other Stories.' The collection might suit you; I am unable to judge. Every work of mine is of slow growth with the English, if it is on these that you rely for your purchasers. They now buy the thirty-seven years old 'Ordeal of Richard Feverel' largely and constantly. At the end of the year, 'The Amazing Marriage,' running in *Scribner's Magazine*, will be published. Americans think it readable, the editor assures me."

Some miscellaneous passages may be quoted. Thus, Mark Twain writes from Hartford on March 1, 1883:

"I should like to become a permanent subscriber to the *Fliegende Blätter*; and I would also like to buy ten or twelve of the back numbers—I mean ten or twelve volumes, which contain twenty-six numbers each. I should prefer them bound. Won't you please instruct the Leipzig agent to fill this order for me and send me his bill?"

Bret Harte first called Baron Tauchnitz's attention to Mark Twain. The former's volume of "Prose and Poetry," his first volume in the "Tauchnitz Edition," appeared in 1872. The latter came in four years later. The following letter brings out these facts:

"I met my friend Mr. Harte in New York a day or two ago, and he handed me your letter of August 21st, to him. That you should propose adding a book or books of mine to your series is a compliment which I greatly value. I suppose, from your letter, that you have a copy of 'Tom Sawyer' by you. Therefore it will not be necessary for me to send one to you. That you have recognized my moral right to my books gratifies me, but does not surprise me, because I knew before that you were always thus courteous with authors."

Beginning with "Tom Sawyer," all of Mark Twain's books came out in the "Tauchnitz Edition," thirty-three volumes. The same is true of Bret Harte's forty-two volumes. And just as the latter suggested Mark Twain to Baron Tauchnitz, so Mark Twain did for two

of his literary friends, as is seen from the following letter:

"PARIS, 7 Rue de l'Echelle, May 25, 1879.

"I am glad you have written Aldrich and Howells. I greatly want to see their books in the Series. My burlesque sketch of the Gambetta-Fourtou duel appeared in *Le Figaro* today; but I don't know French well enough to tell whether it is well translated or not."

In this same year, 1879, both Aldrich and Howells made their bow to the Tauchnitz readers. Today, Howells is represented by seventeen volumes and Aldrich by a volume of his best short stories and "The Stillwater Tragedy."

When Baron Tauchnitz thought of publishing Tennyson's poems in the collection he wrote the poet about a portrait, which subject is referred to in two of the latter's letters.

"FARRINGFORD, ISLE OF WIGHT,

"December 12, 1859.

"I am sorry that I know of no engraving. There is a likeness of me (said to be a very good one) by Mr. Watts at Little Holland House, Kensington, but no engraving has been made from it. There is also a photograph. When there is a good engraving from Watts's picture made, I will send it. I send you here a photograph from the very successful bust by Woolner."

The next year Tennyson writes from the same place on the same subject:

"I was not aware that Messrs. Smith & Elder had the copyright of my portrait by Lawrence. The lips are considered too thick in this portrait."

Here is the way in which Sir Rudyard

BARON TAUCHNITZ

Kipling first came into the series, where he now has seventeen volumes. The following letter is from that prolific story writer—the "Tauchnitz Edition" contains not less than seventy-two volumes from his pen—the late James Payn:

LONDON, December 1, 1889.

"Andrew Lang (perhaps the best critic in England of light literature) was speaking the other day in the very highest terms of 'Plain Tales from the Hills,' by Rudyard Kipling, a collection of Anglo-Indian stories certainly of admirable merit, and which describe English life in India particularly in its relation to native life, as has never been done before. The stories are all short (tho the book is a longish one) and all good. To my amazement I found it to be in a *second edition*, tho I had never before heard of it. It must therefore have been bought (and no wonder) by the Anglo-Indian public. Now the question is, is it worth your while to see the book? If so I will send you my own copy from Mudie's Library, on loan, if I cannot get it elsewhere, which, however, I doubtless can. My only fear is that Anglo-Indian tales, however excellent, may not suit your public, with the additional disadvantage of these being short stories. Would you care to see it?"

In the following year the volume came out in the Leipsic series, and it is still a good seller on the Continent.

Mlle. Louisa de la Ramé wrote as follows in 1900 concerning her famous pen name, which Baron Tauchnitz says had its origin simply from a childish pronunciation of Louisa:

"It is of no consequence, but it is always a pity to confuse the public with two names. Besides, I *love* 'Ouida.' It is my 'very own,' as the children say. I don't care for any other of the names which I bear."

From Viareggio, a little sea-bathing place near Pisa, came this letter, written in the spring of 1907, a few months before this eccentric woman died:

"I have had an accident which has deprived me of the sight of the right eye, I fear permanently. It is a great sorrow as my eyes have been a source of infinite joy to me and were as clear and strong of vision as in my youth. 'Helianthus' stands unfinished still. I have been all the winter here, a few yards off the sea."

The novel mentioned above appeared in the edition in 1909, making a total of

seventy-one volumes which Baron Tauchnitz published from "Ouida's" pen.

Mrs. Craik wrote in 1871:

"You once told me to suggest any good English novels. Have you ever had George Macdonald's? He has written very fine novels, beginning with 'David Elginbrod.' I have also lately read 'A Daughter of Heth,' a remarkably good novel. There are so few novels I like at all that I think you may trust me."

Baron Tauchnitz seems to have given ear to Miss Mulock's advice, for a few months later George Macdonald and William Black both came out in the series, which eventually included twenty volumes by the first author and fifty-five by the second.

Another letter from Mrs. Craik runs as follows:

"Is all well with you and yours? How many grandchildren now? My one child, my 'sunshine,' is sunshining as ever; bright, merry, good, and so quick at her letters that I have strong forebodings some day some future Baron Tauchnitz may have in his library 'A Novel, by Dorothy Craik!'—long after you and I have gone whither we have no more to do with literature, and our 'works do *not* follow us.' But let us hope for many a year before then to see the labor of our hands, and rejoice in it and in our children."

As far as I know, however, Miss Dorothy Craik has not followed in the footsteps of her father and mother.

Wilkie Collins was not only a novelist, but also a philanthropist, or, rather, a lover of the lower animals, as witness these lines written in 1883:

"It is another bond between us—and to me a most encouraging circumstance—to hear that your good father enters his protest too against the infernal cruelties of vivisection, and gives us the support of another illustrious name. Please say this to him, with my sincere esteem and regard."

Robert Browning thus refers to an old contributor to THE INDEPENDENT:

"With respect to the portraits, I should like to submit to your judgment what, on the whole, is the best likeness of my wife, made carefully in Rome in a season of comparative health and repose, and as such, now representing her in our National Portrait Gallery."

PARIS, FRANCE.

Laughter

It may seem strange that Bergson should have turned aside in the course of the development of his system of philosophy to consider so trivial a subject as humor, but, as has already been explained in *THE INDEPENDENT* (Vol. 70, p. 1255), his little volume *Le Rire*¹ is really an integral part of his philosophy, an application of it to a special problem of life and literature. It gives him another opportunity to reinforce in a concrete way two of his main contentions, that the mechanistic view of life is inadequate, and that the intellect is not the only means we have of gaining knowledge. His theory is a startling one, that the perception of the humorous is a purely intellectual act, in which the emotions take no part. When we laugh at a person such emotions as affection, pity and sympathy are in abeyance. "To produce the whole of its effect the comic demands something like a momentary anesthesia of the heart." It would seem to follow, then, that science and humor are more closely allied than has been previously supposed. This might be used to account for the fact that a sense of humor is often characteristic of scientists; for example, Charles L. Dodgson, author of a "Treatise on Determinants" and "The Hunting of the Snark," and Prof. Robert W. Wood, of Johns Hopkins University, draftsman of that useful little manual of flornithology, "How to Tell the Birds from the Flowers." "A humorist," says Bergson, "is a moralist disguised as a scientist."

According to Bergson we see nothing ridiculous in the world except mankind. A landscape is never funny, and if sometimes we find animals funny it is when we catch a resemblance to humanity. We laugh only at people, and, further, we laugh only with people. Laughter is a social act, a method of collective castigation by which minor offenses and devia-

tions from the established norm may be checked. Hence its common use as a mentor in matters of etiquette. "Laughter, then, does not belong to the province of esthetics alone, since unconsciously (and even immorally in many particular instances) it pursues a utilitarian aim of general improvement."

Bergson finds the root of the ridiculous in resemblance of a human being to a mere machine. He discloses this common element in all grades of humor, from the antics of the clown, who makes a jumping jack or a rubber ball out of himself, to the structure of French comedy. In life there is no repetition. The characteristic of vitality is infinite variation. So when a character on the stage repeats a phrase or a gesture over and over it becomes increasingly amusing, because we see the action has become mechanical. The repetition of a scene or a situation by another set of players or by the same players in reversed positions is also a common device of the comedian for exciting laughter. Plays of the school of Molière and Labiche certainly provide abundant examples of such mechanical humor, and perhaps this has led M. Bergson to ascribe too much importance to this factor in comic art.

He traces the same element of the mechanical, the non-lifelike, in all kinds of formalism. The fond father, who boasted of his daughter's learning in the words, "She will tell you, without faltering, all the kings of France that have occurred," was treating the kings as mere impersonal events. The village mayor who said, "The prefect who has always shown us the same kindness, altho he has changed several times since 1847," was confounding the office with the person. Other examples of bureaucratic rigidity are the custom house officials who met the shipwrecked passengers on the coast at Dieppe with the inquiry if they had anything to declare; and the M. P. who, in questioning the Home Secretary about a terrible murder that took place in a railway carriage, said: "The assassin, after despatching

¹LAUGHTER. An Essay on the Meaning of the Comic. By Henri Bergson. Translated by Claudine Brereton and Fred Rothwell. New York: The Macmillan Co. \$1.25.

his victim, must have got out the wrong side of the train, thereby infringing the company's rules.

But it is wronging Bergson to represent him as attempting to classify all humor by a single formula, for no one takes better account of the variety and continuity of all the manifestations of life.

Another book comes to hand on the same topic, but altogether different in character. Its title, *Why the World Laughs*² might rather be "What the World Laughs At," for its philosophy is negligible and the volume consists essentially of summaries of the funny stories and samples of the jokes of all nations and ages, beginning with the Chinese, Japanese, Hindus, Egyptians and Hebrews, and coming on down thru the Greeks and Romans to the modern European races. Pretty dry picking in some of these fields apparently, if we are to judge from the author's garner. To our notion he has found nothing funnier in foreign lands than the story he himself tells of a little old Irishman who trying to see the Hudson-Fulton procession from Grant's Tomb. He stood up on a bench, but was jerked down by a policeman. Then he tried the stone balustrade, and being removed from that vantage point, climbed the railing of Li Hung-chang's gingko-tree. Pulled off of that, he remarked: "Ye can't look at annything frum where ye can see it frum."

The House of Harper

Associated closely with the development of American literature, both in its heavier and its lighter veins, the House of Harper* comes to the front again, without the Harpers at the fore, and apparently it still lives. The "Brothers Cheeryble," four in number, founders of the firm, James, John, Joseph Wesley and Fletcher, are long since dead, and with them a company of able and diligent editors, advisers, artists and some hundreds of thousands of wide-eyed readers, who were fed and delighted at the table that provided, presumably, only a feast of reason and a flow of soul.

Great books and books of minor worth, with the imprint of the firm, now occupy the shelves—the top shelves, back shelves, front shelves, all the shelves—of a thousand libraries, and the record is not yet made complete. Their great editors are dead and yet live. The knightly Curtis is gone; Warner, the delightful entertainer, sitting on his back-log, is gone; but Alden, who spans the break between the old house and the new, keeps fresh the old traditions in the editorial office. Howells sits in the Easy Chair and finds that the modern typewriter can touch the human heart as gently as could the quill or the pen of Curtis. The last of the Harpers is justly proud of the notable men whose names have been household words in two worlds. In his desultory talk of old battles fought, old victories won, he brings up the genial Methodist group and their hardy followers, one after one, as if they were still at the fore. He isn't particular as to the topic, whether it fits in with the last theme or not. It may be a pleasant festal greeting of an old dead author like Charles Reade; it may be an announcement of some new book of Mark Twain. The twentieth century and the nineteenth get a little jumbled. A lively letter of Thackeray's, a bit of personal romance, a tragedy, a sour-faced parting, a jovial reconciliation, a hint of new business, a clash that involves only the dollar or the pound sterling—it is all fireside talk, and the reader hardly cares for the order in which the topics arrive. He feels taken in—half way, at least—into the confidence of the firm. He hears what is to be said in defense of the conservatism that led the shrewd business men of the ante-bellum period to keep out of the "fuss" over the rights of man, as long as the man was black, but he is glad, when the war came, that the brothers joined the ranks that Curtis and Sumner led, and fought well as followers where they had been laggards as leaders; also that they fought well and sturdily, under the valiant Nast, for the overthrow of the Tweed Ring, keeping well up with the times and the *Times* in the battle front, tho it is not so vividly remembered as it might have been, that Tilden made the fight practicable for both. Altho they were always

²WHY THE WORLD LAUGHS. By Charles Johnston. New York: Harper & Bros. \$1.50.

*THE HOUSE OF HARPER. By J. Henry Harper. With Portraits. New York: Harper & Brothers. \$3.

in the long copyright campaign, it was on the wrong side for long. At the close they came in strongly for the producers of the printed book. In the fireside talk, however, one greatly misses the true pioneers—the authors themselves, namely, and the brave Putnams, father and son—who thought of the larger interests of the brains that make the publisher's business possible. One misses, in the index, the names of notable writers who did pioneer work for American letters, leading the new mood in American literature. Perhaps Mary Wilkins Freeman may stand for the type. Surely the omission is an accident.

As business men—and the "Brothers Cheeryble" frankly proclaimed themselves such—the four were sane, safe and successful. Their magazine literature was welcomed the world over in the steady stay-at-home circles of family life for thousands of readers. They nourished the traveling spirit, widened the vision and stirred the imagination. One seldom, it is true, thinks of them as nourishing a brood of poets or leading the creative thought, as did one of their enterprising New England competitors, into "fresh woods and pastures new." They didn't like the woods. One does not recall vividly that they began early to stimulate hopefully, as did one of their younger and brilliant rivals in New York, an artistic, romantic and eager band of pioneers in literature of a new sort by advancing them to the front on the stage, where their bright faces might receive some of the limelight. They took their own path out into the open where the reader was still hewing at the primeval forest or rooting up the stumps of the last clearing, or cultivating the mildly ancestral farm under the twelve-hour scheme, and needed rest on Sundays and a little outlook on the world during the brief period of candlelight after the cows were put to bed. Yet when the good fight for better art and a wider reading came, they made a glori-

FLETCHER HARPER

Youngest of the four original founders of Harper & Brothers ("The House of Harper")

ous break for the front, and did fine work under Charles Parsons.

In this historical résumé of the great House of Harper we see the brothers four at their best as shrewd but genial actors, independent factors in civic progress—followers here, leaders there, but ever ready for the armchair and the evening hour, when no man shall work, but when wit, humor and a temperate feast are in order. There is much truth and beauty in autobiography, and in biography that stands at the gate. Let us welcome both. But the broader truth is deserving and the more glorious beauty will come when time shall

Gather up the scattered ashes
Into History's golden urn.

The Women of the Cæsars. By Guglielmo Ferrero. New York: The Century Co. \$2.

In spite of the somewhat scandalous suggestion of the title, this book of Professor Ferrero's turns out to be a sober enough history of the Imperial Court from Augustus to Nero, with a particular emphasis upon the direct rôle

played by women in the extremely complicated politics and domestic relationships of the time. The style is direct and lucid, and the author shows a high degree of literary skill in maintaining an

made their lives legendary even to the age in which they lived, and these pages present Tiberius, Julia, Caligula, Agrippina, Nero, as mysterious, sinister. It seems not so much history as a mythus

A ROMAN MARRIAGE CUSTOM

From a drawing by André Castaigne, to illustrate Professor Ferrero's "Women of the Caesars." (Copyrighted 1911 by The Century Company.) The picture shows the bride entering her new home in the arms of her husband.

intelligible path thru the social welter that he depicts. It cannot be said that he succeeds in making his characters very human. Their curious abnormalities

of a race of semi-diabolical supermen and women, shadowy figures playing at empire. It is incredible that such men should have been masters of the world.

The opening chapter on "Marriage in Ancient Rome" is perhaps the most interesting and illuminating, showing as it does the legal freedom and real sphere of influence that were enjoyed by the Roman matron. There is a vivid presentation of the drastic and almost pathetic attempts made to regenerate Roman society by means of divorce and sumptuary laws. The complex story of matrimonial intrigue that fills the later chapters is never allowed to fall into anecdotal gossip or even triviality. The author throws all his details in their proper perspective against the larger social background. This restraint and lucidity make the book probably one of the very best of all the short histories of the Rome of the first century.

The Passing of the American. By Monroe Royce. New York: Thomas Whittaker. \$1.20.

Mr. Monroe Royce is an American clergyman who has held charges in foreign churches for several years, and who has now returned, "stunned" and "dazed," to an America that speaks all tongues but English. To inspire his countrymen to seize the land and resist the polyglot invasion, he avowedly courts social martyrdom, and speaks the language of the common scold. All America is decadent, to his notion. The trust, the school, the woman, the man, the farmer, the humorist,—but most of all the trust,—are so far from the sober rectitude of his ancestry that we wonder he should consider any of them worth saving. He has read the newspapers and talked to fellow passengers on the Atlantic steamers, and has collected from them the items upon which he bases his indictment. The inconsistencies of his tirade have escaped his notice. The prosperous German farmer who had never met but one American who knew how to farm, and who had risen to independence in a decade, offers no menace to the United States; and if it be true, as Mr. Royce asserts dogmatically and defiantly, that "one acre yields as much to the French farmer as forty-two to the American farmer" (42), the incompetent American is not worth preserving. The book is the best specimen of the pessimism of the over-refined

social consciousness that we have seen. But we refuse to abandon our faith in the assimilative powers of the nation because of the bad manners of our peanut vendors (61), or to wish for a "Cromwell" to "come forward and kick these little creatures out of the doors of the Capitol and send them about their business" (82), because the reward of Peary has been too moderate.

Woman's Part in Government. By William H. Allen. New York: Dodd, Mead & Co. \$1.50.

A sane review of the part in public affairs possible to women under the present régime is this volume, by the Director of the Bureau of Municipal Research. Whether women vote or not, whether they want to vote or not, concerns the author very little. According to Dr. Allen, woman has already three functions in government: First, to do efficiently her work as an individual member of society; second, to aid the State by means of her church, club, trades union, or any other voluntary association; third, to influence public opinion and official action, directly and consciously. The book is a summons to responsibility for and activity in political affairs. Dr. Allen has no sympathy with the idea that "woman's place is in the home," while the whole outside world is pressing upon the home and pouring into it thru a thousand avenues. The book is a wholesome stimulant, because it calls woman to her duty, here and now, and is full of most practical suggestions as to what her duty is and how to go about it. Pending the acquirement of the more direct power of the ballot, there are many ways in which a woman may make of herself a useful and desirable citizen and train herself for greater service by doing all that she can under her present limitations. By pointing out the many avenues of public activity now everywhere open to her, Dr. Allen has done woman a genuine service, and we hope it may inspire her to greater efficiency. He is a master in the art of the graphic presentation of facts and figures, and the book is one that should be on the library shelves of every woman's club for information as well as inspiration.

White Pine
Pitch Pine
Norway Spruce
Hemlock
FROM MRS. COMSTOCK'S "HANDBOOK OF NATURE STUDY"

Handbook of Nature Study. By Anna Botsford Comstock. Ithaca, N. Y.: Comstock Publishing Company. \$3.25.

In an exquisitely illustrated volume of more than nine hundred pages Mrs. Comstock has collected the results of many years of teaching and observation. The sub-title states that the book is intended for teachers and parents, and we cannot imagine a better guide to sensible and scientific nature study. The lessons

are pleasantly colloquial in language and not in the least above a child's comprehension; but, on the other hand, there is no "writing down" to an assumed low level of intelligence. The information is scientific in presentation and trustworthy in content. Mrs. Comstock understands human nature as well as extra-human nature, and there is a saving sense of humor which spares the reader "gush," and a genuine love of the out-of-doors

world which touches her lessons with poetry. The photographs of such subjects as "milkweed seed-balloons" and a "spider's web pearly with dewdrops" are admirably done, and the whimsical initials for the "Teacher's Stories" are charming. Teachers and parents alike should welcome Mrs. Comstock's help in opening the child's mind to the wonders all about him in wood and field and sky.

Literary Notes

....An unpretentious but readable sketch of the life and labors of the late *Dr. McLaren of Manchester* (Hodder; \$1.50) has been written by his sister-in-law, E. T. McLaren.

....In his new volume on *Self-Investment* (Crowell; \$1) Orison Swett Marden writes in his usual vigorous and pointed style about those personal qualities and adjuncts which should be developed as assets by every one engaged in the business of living a successful life.

....Prof. Abram L. Isaacs, Ph. D., of New York University, answers the question, *What Is Judaism?* (Putnam; \$1.25) by giving pictures of many sides of Jewish life, thought, achievement, and present activity. These essays show both catholicity of spirit and a whole-hearted championship of the permanent worth of Judaism.

....For fifty years the late Robert Hoe, who perfected the printing press, was a persistent collector of rare books. In his will he directed that every book be sold by auction, and accordingly his executors placed the library in the hands of the Anderson Auction Company of New York. Half of the collection has now been sold, for almost a million and a half dollars. The total for the four greatest English collections ever dispersed—the Heber Library, the Sunderland Library, the Beckford collection, and the Ashburnham MSS., only slightly exceeded this amount. Over and over again the records for high prices were broken. The \$50,000 paid for the Gutenberg Bible on vellum was the highest price ever paid for a printed book; the \$42,800 for "Le Morte d'Arthur" was the second highest price. The \$33,000 paid for the "Pembroke Hours" was the highest price ever paid for an illuminated manuscript; the \$24,000 for the "Hours of Anne de Beaujeu" was the second highest price; a First Folio Shakespeare brought \$13,000; and the \$10,000 paid for John Winthrop's Declaration was the highest price ever paid for an American book. In the first sale twenty-three items sold for more than

\$5,000 each. The third section of this library will be sold in the Anderson Galleries in twenty afternoon and evening sessions during the two weeks beginning April 15, and the fourth section will be sold next fall. Among the features of Part III are these: In the department of incunabula, "The Chirche of the Euyell Men and Women," printed by Wynkyn de Worde in 1511; the "Contemplation of the Shedding of Blood," from the press of the same printer ten years earlier, and Gower's "Confessio Amantis," printed by Caxton in 1483. In English literature are the third folio Shakespeare, first editions of Dryden, Bacon on "Learning," 1605, and a copy of his "Essays," 1612, Dekker's writing in first editions and Hooke's "Amanda"; also first editions of Goldsmith, Pope and Scott. Mr. Hoe's partiality for fine bindings was well known and every section of the library contains noteworthy examples of the work of the great binders. Many association books belonging to famous kings and queens are in this division. In the department of Americana, among other treasures, are the first engraved view of New York, Hubbard's "New England," 1677, containing the rare map, and Mather's "Account of Massachusetts," 1717, which is one of two or three known copies.

Notes on the Season's Books

WHEREAS other folk know that spring has come because the grass is green, or because boys are shooting marbles at the street corners, the Literary Editor is aware of the fact since his desk is buried under new books and publishers' announcements. It is possible to name only a few volumes—some of those in which our readers are likely to be most interested.

THE NEW FICTION.

Kate Langley Bosher tells in *The Man in Lonely Land* the story of a New Yorker, a lovable Southerner, and a pair of amusing children (Harper). At the other pole, but on the same publisher's list, we spy *From the South of France*—a collection of five stories by Thomas A. Janvier. Duffield announces a new translation of a novel of French provincial life by Henry Bordeaux: *The Woolen Dress*. Amélie Rives interweaves, in *Hidden Houses*, announced by Lippincott, a story of a dual personality, and a great love. George Randolph Chester, inventor of Wallingford, comes before the public with a new book, *Five Thousand an Hour* (Bobbs), while Rupert Hughes, who need no longer say "Excuse me," signs *The Old Nest* (Century). The new Chesterton tale is *Manalive*—of which innocent Smith is the hero (Lane). Mr. Chesterton does not fear to give his characters commonplace names; nothing else about his books

is commonplace. A sequel to *The Dangerous Age*, by Karin Michaelis, is entitled *Elsie Lindtner* (Lane). Arnold Bennett's forthcoming volume of stories is called *The Mator of the Five Totens* (Doran). Jack London's book of short stories called *The House of Pride* will be published by Macmillan. W. J. Locke writes a new novel in *The Joyous Adventures of Aristide Pujol* (Lane), while Warwick Deeping's new contribution is entitled *Fox Farm*, and has rural England for its scene, today for its time (Cassell). The Baroness von Hutten appears on the Appleton list with a new story of English life called *Sharrow*. The same house brings out another posthumous David Graham Phillipic in *The Price She Paid*. A writer well known to our readers as a contributor to THE INDEPENDENT, Mrs. Corra Harris, publishes *The Recording Angel* thru Doubleday—who announce *Red Eve*, a tale of the Middle Ages, by Rider Haggard, and a new, complete edition of O. Henry, in twelve volumes. A new mystery tale by Louis Joseph Vance is entitled *The Bandbox* (Little). A brilliant Irishman, G. A. Birmingham, is the creator of *The Simkins Plot* (Doran). The scenes of Mrs. Atherton's *Julia France* are laid in the West Indies, England, India and San Francisco (Macmillan). The juveniles are too numerous to mention. On the list of Lothrop, Lee and Shepard we note a new story by D. Lange, *On the Trail of the Sioux*, and an eighth volume in Edward Stratemeyer's *Dave Porter Series*.

DRAMA AND VERSE.

The drama is well represented in the spring announcements. Scribners have issued or will soon issue a volume of Strindberg (in translation by Edwin Björkman); a volume *From Ibsen's Workshop* (first drafts of several of his plays); *Wild Oats*, *The Pigeon*, *The Eldest Son*—all by John Galsworthy. Harpers publish Mr. Kennedy's *The Terrible Meek*, a one-act play now presented by Winthrop Ames and described as "a peace play which analyzes the question of a soldier's obedience." William Watson's *Heralds of the Dawn* is described as a drama in four acts, chiefly in blank verse (Lane). *The Tragedy of Etarre* is a dramatic poem by Rhys Carpenter (Sturgis).

Herbert Trench's work is gathered in one volume of *Lyrics and Narrative Poems* (Doran). Among the younger Americans Robert Haven Schauffler is represented by his *Scum o' the Earth, and Other Poems* (Houghton), and Ezra Pound (as translator) by *The Sonnets and Ballate of Guido Cavalcanti* (Small). Francis Coutts publishes a new volume of verse in *Egypt and Other Poems* (Lane), while *The Candle and the Flame* is the title conferred upon his latest volume of verse by George Sylvester Viereck (Moffat). A new volume by Cale Young Rice, *Far Quests*, will be published by Doubleday; so, too, Rudyard Kipling's *Songs Out of Books*.

LITERARY HISTORY AND CRITICISM.

The History of English Lyric Poetry, by Edward Bliss Reed, is promised by the Yale University Press; *Poetry and Prose*, essays

by A. A. Jack, by Dutton, along with *Posthumous Essays*, by Churton Collins, and Hilaire Belloc's *First and Last*. Houghton Mifflin Co. have collected a number of essays by Edward Percy Whipple, and publish them in a single volume under the title *Charles Dickens: His Life and Work*. They issue also Professor Otto Heller's *Henrik Ibsen: His Plays and Our Problems*.

BIOGRAPHY AND MEMOIRS.

Wilfrid Ward's *Life of John Henry Cardinal Newman* (Longmans), founded upon the prelate's journals and correspondence, is one of the books we have been waiting for. Justin McCarthy's *Irish Recollections* will be issued by Doran, who likewise publishes the life of *Sir George Nevins*, journalist and publisher, by Hulda Friedrichs. From Doubleday we receive *One Look Back*, a volume of reminiscences by G. W. E. Russell. Frank Hamel's *La Fontaine*, as well as the English translation of M. Lollée's *Prince Talleyrand and His Times*, is issued by Brentano's. One may not admire the noble author, but information as well as entertainment may be expected in *Men and Things of My Time*, by the Marquis de Castellane (McClurg). As an indication of the curiosity of modern readers with respect to everything concerning men of letters let us accept François's *Recollections of Guy de Maupassant*—François being valet to the novelist (Lane). Mary Antin's *Promised Land* is the autobiography of a Polish Jew now the wife of a Columbia professor (Houghton). Nietzsche's sister—Mrs. Foerster-Nietzsche—is the author of a two volume life of the philosopher (Sturgis).

TRAVEL.

The literature of travel grows with alarming rapidity. However, the death rate is high here. For more than a year Africa has been a very much discussed continent; and Africa is represented on the Lippincott list by Major Tremearne's account of *The Tailed Head-Hunters of Nigeria*, and by Captain Haywood's *Through Timbuctu and Across the Great Sahara*. From the same publishers we await Douglas Rannie's *Adventures Among South Sea Cannibals*. For some years the author served as an agent of the Queensland Government, caring for the interests of laborers recruited from the South Seas. We are assured that his escapes are narrow enough to suit the most exacting. *On the Backwaters of the Nile* embodies the experiences and observations of Rev. A. L. Kitching among the outlying tribes of Uganda (Scribner). *Africa of Today* is a handbook by Josephine King Goodrich (McClurg); while for those who must combine travels and politics there will be *Tripoli the Mysterious*, by Mabel Loomis Todd (Small). *How to See Italy*, by Douglas Sladen, is described by the publishers (Pott) as a companion volume to Hare's *Walks*. Mrs. Aubrey Le Blond writes of *Old Gardens of Italy* (Lane). The last-named publisher issues *The Magic of Portugal*, by A. F. G. Bell. *The Spell of France* is by Mrs. Caroline Atwater Mason (L. C. Page), and *Rambles in the Pyrenees*, by A. H. Jack-

son (Dutton). Paris has its quota of travel-books, including a translation of Georges Cain's *Byways* (Duffield); *Footprints of Famous Americans in Paris*, by J. J. Conway (Lane), and *Paris à la Mode*—gastronomic promenades by Julian Street (Lane). In the *Amazon Jungle* is Algot Lange's account of adventures where the "gastronomic promenades" are made by cannibal Indians (Putnam). W. B. Cabot will take his readers for travels in *Northern Labrador* (Badger). Maurice Baring writes from experience of *The Russian People* (Doran). The Near East is represented in Sir Edwin Pears's *Turkey and Its People* (Doran); the Far East in *Japan of the Japanese*, by J. H. Longford (Scribner).

BOOKS FOR THE COUNTRY-LOVER.

Out-of-door books include the *Butterfly and Moth Book* of Ellen Robertson-Miller (Scribner); Jessie P. Frothingham's *Success in Gardening* and Mrs. Drennan's *Everblooming Roses* (Duffield); John Muir's *The Yosemite* (Century); Winthrop Packard's *White Mountain Trails* and *Literary Pilgrimages of a Naturalist* (Small), and a number of volumes in the Young Farmer's Practical Library, of which Ernest Ingersoll is general editor (Sturgis). *Small Country Houses of Today* and *The House and Its Equipment*, edited by Lawrence Weaver, *English House Design*, by Ernest Willmott, and *The Essentials of a Country House*, by R. A. Briggs, are all four published by Scribners. *Marvels of Fish Life*, by Francis Ward (Cassell) describe a neglected field—if it is a field—in nature study. *Wonders of Plant Life* is an illustrated volume by S. L. Bastin, which the same house issues. It is appropriate that the Garden City publisher should give forth W. P. Wright's *Popular Flower Gardens* and J. H. Comstock's *Spider Book* (Doubleday). Doran publishes *A Farm in Dreamland*, by Charles Garvie: a book about farming in Devonshire, by a novelist who has tried it. C. E. D. Phelps presents *A Farmer's Note Book* (Badger).

HISTORY.

The concluding volume of Sir George Trevelyan's history of the American Revolution is announced by Longmans under the title *George the Third and Charles Fox*, and so is the third volume of Sir Thomas Erskine May's *Constitutional History of England Since the Accession of George III.* completed and edited by Francis Holland. A prize essay by William S. Anderson is devoted to *Smuggling in the American Colonies* (Moffat). On the Neale Publishing Company list for the spring William Estabrook Chancellor's *Our Presidents and Their Office*; a compilation by Captain E. R. Hutchins of *Echoes from Both Sides*, entitled *The War of the 'Sixties*, and *When the Ku Klux Rode*, by Eyre Damer, all appear. *An Artillery Officer in the Mexican War* consists of letters written by Captain Robert Anderson, U. S. A. (Putnam). *The Contest for California in 1861*, by Elijah R. Kennedy, tells how Colonel E. D. Baker saved the Pacific States to the Union (Houghton).

POLITICS

In this field we shall have Herbert Croly's *Marcus Alonzo Hanna* (Macmillan) and *A Personal Narrative of Political Experiences*, by none other than Robert Marion LaFollette (Doubleday). The Senator contributes, also, an introduction to Gilbert E. Roe's *Our Judicial Oligarchy* (Huebsch). Charles McCarthy's analysis of *The Wisconsin Idea* (Macmillan) takes into account State regulation of railroads and public utilities; also the referendum, recall, etc., and the work of experts called in from universities, and elsewhere, to aid State commissions. *Wisconsin: An Experiment of Democracy*, by Frederic C. Howe (Scribner's) is also an optimistic account of the adventures of a progressive State in self-government. *The Initiative, Referendum and Recall* are made the subject of criticism by various authorities, and the volume is edited by Professor W. B. Munro (Appleton). Professor C. A. Beard presents *Initiative, Referendum, and Recall Documents* (Macmillan). Walter E. Weyl describes *The New Democracy* (Macmillan). *The Immigration Problem* is treated by Professor J. W. Jenks (Funk). *The Record of a City* is an account of the evolution of Lowell, Mass., by Dr. G. F. Kenngott (Macmillan). Other books on government are Professor C. L. Jones's *Readings on Parties and Elections in the United States* (Macmillan), *The President's Cabinet*, by Dr. H. B. Learned (Yale) and *The Origin of the English Constitution*, by Professor G. B. Adams (Yale).

ECONOMICS AND SOCIOLOGY.

Big Business and Government is the pertinent subject of an essay by C. N. Fay—who has had inside experience with big business (Moffat). Books on Socialism are John Spargo's *Applied Socialism* (Huebsch); a symposium published by Harpers under the title *Socialism and the Great State*, and *Essentials of Socialism*, by Ira B. Cross (Macmillan). Rev. C. F. Dole is the author of an essay on *The Burden of Poverty: What to Do* (Huebsch). Professor Scott Nearing's *The Super-Race* is a study of heredity, eugenics and social adjustment (Huebsch). Books on transportation include *Railways in the United States*, by Simon Sterne, and *Railway Transportation*, by C. L. Raper (both are published by Putnam), and *Railway Economics: A Collective Catalogue of Books in Fourteen American Libraries*—prepared by the Bureau of Railway Economics at Washington and issued by the Yale University Press. *Old Age Dependency in the United States* is studied by L. W. Squier (Macmillan).

SCIENCE.

A Compendium of Aviation and Aerostation, by Lieut. Col. H. Hoernes, a book concerning balloons, dirigibles, and flying machines, is only one of the scientific works (practical and theoretical) which are promised by Lippincott. Next we may appropriately call attention to *Death—Its Causes and Phenomena*, promised by Hereward Carrington and J. R. Meader (Funk). The same

publisher announces a translation of *The Education of Self* by Dr. Paul Dubois. Dr. G. Stanley Hall's Columbia lectures are published under the title, *The Founders of Modern Psychology* (Appleton). Longmans announce *Chapters from Modern Physiology* by Prof. J. R. Angell; Huebsch, a translation by André Tridon of Yves Delage and Marie Goldsmith's *The Theories of Evolution*. Another book for the layman is Dr. W. S. Sadler's *Physiology of Faith and Fear*, announced by McClurg, with its sub-title: *The Mind in Health and Disease*. *Storage Batteries* are elucidated by H. W. Morse (Macmillan).

PHILOSOPHY AND RELIGION.

Professor Borden Parker Bowne's *Kant and Spencer* will bear the imprint of Houghton. From Macmillan's press will come Professor H. H. Horne's *Free Will and Human Responsibility*. *The Philosophy of Bergson* is appraised by A. D. Lindsay, of Balliol (Doran), while E. Hermann discusses *Eucken and Bergson: Their Significance for Christian Thought* (Pilgrim Press). *The Psychology of the Christian Soul* is studied by Rev. George Steven (Hodder). Dr. Grenfell and Rev. J. D. Jones write *On Immortality and of Our Life Beyond* (Pilgrim). Principal Garvie issues a companion volume to *Studies in the Inner Life of Jesus* in his *Studies in Paul's Gospel* (Hodder). Rev. John Oman discusses *The Church and the Divine Order*; Professor J. Wendland, *Miracles and Christianity*. Both books are issued by Hodder and Stoughton. A new volume of Harold Begbie's *Other Sheep* is announced by Doran. Other religious books of consequence are Rev. H. W. Hulbert's *The Church and Her Children*—the problem of child attendance; Dr. C. S. Macfarland's *Spiritual Culture and Social Service*; Dr. G. Campbell Morgan's *Sunrise: Behold He Cometh* (these volumes are published by Revell); *The Meaning of God in Human Experience*, by Professor W. E. Hocking (Yale); *The Historic Jesus*, by C. S. Lester (Putnam); *The Christian View of the World*, by Professor G. T. Blewett (Yale); *Socialism and the Ethics of Jesus*, by Professor H. C. Vedder (Macmillan). John Haynes Holmes discusses *The Revolutionary Function of the Modern Church* (Putnam). George Haven Putnam studies the prohibitory and expurgatory indexes in *The Censorship of the Church* (Putnam). *The Constitutional and Parliamentary History of the Methodist Episcopal Church* is recorded by James M. Buckley (Eaton & Mains).

ART.

Recollections of a Court Painter, by H. J. Thaddeus, R. H. A., promises much of personal interest, as does another work from the same publisher (Lane): Thomas. Way's *Recollections of James A. McNeill Whistler*. A. E. Gallatin is already known as a writer of *Notes and Footnotes* about Whistler; his book on *Whistler's Panels and Other Modern Profiles* is promised for the spring (Lane). *The Painters of the School of Ferrara*, by Edmund G. Gardner, is the new addition to Scribner's

Library of Art, while Corradi Ricci's *Baroque Architecture and Sculpture in Italy* is announced by Dutton. *On the Laws of Japanese Painting*, by Henry P. Bowie, and *The Heritage of Hiroshige*, by Dora Amsden, the latter being a glimpse at Japanese landscape art, are among Paul Elder's offerings. *Romanesque Architecture in France*, by Dr. Julius Baum (Dutton), and *An Architect's Sketch Book*, by Robert S. Peabody (Houghton) may be noted here. To Putnam's Connoisseur's Library Frederick Wedmore contributes a volume on etchings. C. L. Hinds writes of *The Post Impressionists* (Doran).

Pebbles

"A WAR is a fearful thing," said Mr. Dolan. "It is," replied Mr. Rafferty. "When you see the fierceness of members of the army toward one another, the fate of a common enemy must be horrible."—*Washington Star*.

TOMMY'S AUNT.—Won't you have another piece of cake, Tommy?

Tommy (on a visit)—No, I thank you.

Tommy's Aunt—You seem to be suffering from loss of appetite.

Tommy—That ain't loss of appetite. What I'm sufferin' from is politeness.

A BALLADE OF SUICIDE.

The gallows in my garden, people say,
Is new and neat and adequately tall;

I tie the noose on in a knowing way
As one that knots his necktie for a ball;

But just as all the neighbors—on the wall—
Are drawing a long breath to shout "Hur-
ray!"

The strangest whim has seized me. . . . After
all

I think I will not hang myself today.

Tomorrow is the time I get my pay—

My uncle's sword is hanging in the hall—

I see a little cloud all pink and gray—

Perhaps the rector's mother will not call—

I fancy that I heard from Mr. Gall

That mushrooms could be cooked another
way—

I never read the works of Juvenal—

I think I will not hang myself today.

The world will have another washing day

The decadents decay; the pedants pall;

And H. G. Wells has found that children play,

And Bernard Shaw discovered that they
squall.

Rationalists are growing rational—

And thru thick woods one finds a stream
astray

So secret that the very sky seems small—

I think I will not hang myself today.

ENVOI

Prince, I can hear the trump of Germinal,

The tumbrils toiling up the terrible way;

Even today your roval head may fall,

I think I will not hang myself today.

—G. K. Chesterton, in *The Eye Witness*.

One Year, \$3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

Popular Power and Civilization

IF, within the next twenty-five years, the wage-earning population should obtain control of the state in England, France, Belgium, Germany, Italy and the United States, in other words, should become for practical purposes "the sovereign people," what would happen to "civilization"? What are the chances that such a transfer of power actually will be accomplished within the near future?

We all know the socialist answer to these questions. The socialist views the "revolution" as imminent and views it with joy. He believes that "civilization" is yet to be achieved, and that it will come when justice has been established thru the "broadening down" of power.

Our foreknowledge is possibly less complete and assured than is that of our more radical friends, and we admit that we are troubled by misgivings which do not seem to worry them.

It is obvious enough that in England and in Belgium the wage-earning population, if it were politically united, could

control the state now, and that if industrial evolution goes on for a generation more, as it has been going on for a generation past, a wage-earning population will be the political sovereign in every part of the western world. It is obvious, too, that by such "direct action" as a coal strike, the wage earners of the world, if they were strongly enough united, could force large concessions immediately. Therefore the man who keeps his eyes open and looks about him is not likely to deny that the economic, moral and political power of the industrial population is probably destined to become a formidable fact.

What, then, of the consequences? If the radical who expects a millennium of justice and happiness for everybody is a rather "easy" optimist, the reactionary who predicts a return to barbarism, or even to savagery, is a quite gratuitous pessimist. Under the mask of industrial workers there are criminals in all countries, and they would exploit a period of social disorganization, if one should come, as they exploited it in the days of the Terror and of the Commune in France. But wage earners in general, the multiplying millions of them, are not savages nor yet barbarians.

Every man who is much in contact with the world knows by sight and, in many instances, as personal acquaintances wage-earners in various occupations. Call to mind the brakemen on the railroad trains on which you travel, the men and women that you see going to shops and factories day by day, the boys that deliver your groceries, the man who takes care of your furnace, and so on thru a long list of possibilities. You know that these men and women, for the most part, are industrious, honest, well-meaning, kind-hearted and as sincerely desirous of bringing up their children to be good men and women as you are. Their tastes and interests may not always be yours, but if they get political power they will not plunge into a revel of crime, nor knowingly wipe out "civilization."

What, then, are our misgivings? To be quite frank they are, that if the industrial population should become able

in the near future to put in force a radical social program, it would seriously impair civilization *unintentionally* and without at all knowing what it was doing.

If such a thing happens it will not be the fault of the industrial population itself. It will be the fault of the present generation of wealthy men and women now enjoying special privileges, without accepting and adequately discharging the duty so to broaden the intellectual opportunities of the wage-earning masses that our heritage of knowledge shall become securely the possession of hundreds of millions, instead of hundreds of thousands.

Astonishingly few persons today, even among the so-called educated classes, realize how absolutely our wealth-producing processes rest upon scientific discovery, and how exceedingly small, in proportion to the whole population of the world, is the number of men and women who possess the scientific knowledge upon which the fate of mankind hangs. Safety consists in enormously multiplying the number of the informed, and it is doubtful whether the educational efforts of our time are achieving their proper objects. It is, of course, a gain that actual illiteracy is disappearing. Wage-earners generally can at least read and write. Perhaps a larger proportion of wage-earners than of other classes read books and serious pamphlets and essays dealing with "class struggle" questions, but there is, unfortunately, little reason to doubt that the men and women of all classes today find serious reading on science, art, literature and history very irksome. We should like to see a "forward movement" which should make the dissemination of knowledge its serious business. We should like to see an effort made to persuade at least one adult person in every hundred to read an hour every day *for information* as distinct from recreation or killing time. Reading for information is work. If one person in each one hundred would systematically add this bit of work to his day's task, there would be no basis for fear that popular power would knowingly or unwittingly impair our "civilization."

Translating Christianity

THE presentation at the Little Theater in New York and the publication of Mr. Kennedy's new play, "The Terrible Meek,"* has revived the interminable discussion of the propriety of modernizing the story of Christ. The question comes in every field of art; in literature whenever attempts are made as in "The Twentieth Century New Testament," to put the gospels into such English as its authors would have used if they were writing today; in art whenever a painter, like the late Josef Israels, pictures Christ breaking bread in the home of a modern laboring man; in the drama when Mr. Kennedy brings Christ into a modern dining room as Manson, "The Servant in the House." This play, which many American pastors advised their congregations to see as a vivid lesson in applied Christianity, was by our brethren in England regarded as so sacrilegious that the censor prohibited its production in its original form.

The same difference of opinion will be shown in the case of Mr. Kennedy's new play by those who read or hear it. We say "hear," not see it, for the stage is darkened until the very end, and the light of the sentry's link only faintly outlines two other figures on the wind-swept hill, a weeping woman and a conscience-stricken officer. The audience is at first in the dark, metaphorically as well as physically, for the cockney dialect of the soldier and the references to the duty of the Army and glory of the Empire lead one to think, as the author intended, of the methods of modern imperialism. A bit of the dialog will serve to show the style:

SOLDIER—Well, we done for 'im good an' proper, any 'ah.

CAPTAIN—My God, yes. We builders of empire know how to do our business.

SOLDIER—Pretty bloody business, too, aint it, sir?

CAPTAIN—Yes, that's the word.

SOLDIER—It's an ill wind what blows nobody any good. I got summat aht o' this, orl said an' done.

CAPTAIN—What's that?

SOLDIER—I got some of 'is togs.

CAPTAIN—His togs. How do you mean?

*THE TERRIBLE MEEK. A one act play for three voices, to be played in darkness. By Charles Rann Kennedy. New York: Harper & Bros. \$1.

SOLDIER—Why, I tell yer. 'E didn't want no more togs, not the way 'e was goin'; nah did 'e? So me an' the boys, we got our 'eds together, and arter we'd undressed 'im an' put 'im to bed, so to speak, we pitched an' tossed for the 'ole bag lot, one by one, till they was orl bloomin' well divided aht!

Such language as this is shocking. It was designed to shock. It is when the crucifixion becomes merely a pretty bit of symbolism, an attractive design in embroidery or jewelry, that it ceases to be shocking, because then it ceases to have any connection with the brutal, bloody deed it really was. If the evangelists had been concerned with describing a dignified and impressive death scene they would never have recorded such an incongruous incident as the casting of lots. It is a jarring detail. It shows that the soldiers were not in the least awed by the occasion. They were simply doing their duty and willing to get a little profit and excitement on the side. They were merely common soldiers, the soldiers common to every age and every army. The profanity and vulgarity of Mr. Kennedy's soldier is doubtless but a mild paraphrase of the language of the Roman legionaries when they were spitting in Jesus's face and hitting him over the head with a stick. This soldier, in fact, is quite devoid of enmity: "Rawther liked 'im, the bit I saw of 'im, sir." But he cannot be convinced that he has done anything wrong; he was obeying orders, doing his duty as a soldier. The captain, however, realizes that there is a higher law, a new conception of duty, come into the world, and he says to Mary:

"I tell you, woman, this dead son of yours, disfigured, shamed, spat upon, has built a kingdom this day that can never die. The living glory of him rules it. The earth is *his* and he made it. He and his brothers have been molding it and making it thru the long ages; they are the only ones who ever really did possess it; not the proud, not the idle; not the wealthy, not the vaunting empires of the world. Something has happened up here on this hill today to shake all our kingdoms of blood and fear to the dust. . . . The meek, the terrible meek, the fierce, agonizing meek, are about to enter into their inheritance."

The officer refuses henceforth to obey such orders, altho he realizes that his disobedience means his death. The mist rises from the hill, and in the background, outlined against a bright sky,

the audience sees for an instant three gaunt crosses. Then the audience, the critical, curious, skeptical, cosmopolitan, well-fed, pleasure-loving, first-night New York audience, which has sat for the better part of an hour with attention strained upon the darkened stage, departs in silence without applause, without bustle and crowding, without the chattering comment usual to a theater exit.

Audiences in schools, churches and social settlements listen with the same interest and attention when Mr. Kennedy merely reads the Bible. It is an old story, but new to them because it is a language they understand, the only language they understand, their own. For he reads in everyday English what was written in everyday Greek, not the English of that "most high and mighty Prince," that "most dread Sovereign," that "learned and judicious Prince," His most Sacred Majesty, King James.

There is no space here to argue the question of the propriety of the introduction of the personality of Christ or biblical incidents into a modern environment, whether in art, letters or drama. Argument would in any case be useless, because where there exists such strong and permanent antagonism of view on the part of equally devout Christians there must be more than one side to the question. But we can briefly indicate why in our opinion such antagonism exists. Everybody believes in the historic Jesus, the Jew of Palestine; everybody, that is, except a few of the highest of higher critics. But Christians believe in addition in the living Christ, the contemporary of each generation, at home in every land, taking an active part in the world's work today as much as ever, today more than nineteen hundred years ago, we hope. Is it, then, permissible to represent Jesus Christ in doublet and hose, as did painters of the Renaissance, and in trousers and boots, as do some modern painters? Is it permissible to put into his mouth common sixteenth century German, or seventeenth century English, twentieth century English, or, in fact, any other than the original Aramaic? Historically it is wrong. Esthetically it is questionable. Theologically it is right. And according as one's religious senti-

ments are dominantly historical, esthetic or theological will he be repelled or attracted by attempts at verbal or pictorial reincarnation. When the Rev. Charles M. Sheldon wrote stories of what Jesus would do in various walks of life, hundreds of thousands of good Christians were edified. Doubtless as many more equally good Christians were horrified. When W. T. Stead published his sensational exposure of municipal vice under the title of "If Christ Came to Chicago," some people were thrilled and aroused to action, but others were disgusted, shocked at the close proximity of the incongruous words "Christ" and "Chicago," just as they had been shocked by the very idea of Jesus as the editor of a Topeka daily. Olive Schreiner's story, "Peter Halkett, Trooper," tho one of the most powerful pleas for peace ever written, wounded the artistic and religious susceptibilities of many because therein Jesus appeared, not in a blaze of glory, in the heavens, but as a wearied wayfarer on the veldt, seeking the campfire of a British soldier. All such attempts to translate the Bible into the vernacular, to modernize the gospel story, will necessarily meet with both approbation and reprobation. A question of taste is not justiciable. Neither is a question of religious instinct. What is one man's spiritual food is another man's poison.

Prosecution of Trusts

THE Government has been criticised many times in the last ten years for failing to pursue officers of combinations under the criminal provisions of the Anti-Trust law. But the record of its attempts to enforce those provisions is not an encouraging one. Within a week there have been two notable examples. The ten accused officers of the great beef companies in Chicago have been tried and acquitted. In New York the prosecution of Sugar Trust officers on account of what was done in connection with the memorable loan to Adolph Segal has come to nothing. In a disagreeing jury there were not more than two for conviction. The history of criminal proceedings under the Sherman act is one of failures. We recall no convictions except those of men connected with the Turpentine Trust.

No one attacks the judge who presided at the trial of the Beef Trust defendants. Attorney-General Wickersham says his rulings and instructions to the jury were fair. No one asserts that the jurymen were corrupted, altho the Attorney-General says he thinks they "protected the defendants on the ground that they were men of large business affairs." Let us see who these men were:

J. H. Edwards, twenty-eight years old, telephone inspector, Streator

Asa Bannister, sixty-two years old, farmer, Naperville.

H. I. Bucklin, fifty-four years old, farmer, Dundee.

Jacob Gleim, forty-six years old, baker, Ottawa.

Howard C. Bates, forty-three years old, president of Chicago tailoring firm; lives in La Grange.

William J. Thomas, forty-five years old, clerk, Ottawa.

Burton H. Myers, forty-two years old, town clerk, Naperville.

Adam S. Clow, fifty-three years old, farmer and politician, Plainfield.

Charles H. Nare, fifty-eight years old, drug salesman, 3338 Flournoy street, Chicago.

Judson E. Harvey, fifty-eight years old, grocer, Wilton Center, town of fifty people.

Edward J. Ryon, fifty-two years old, carpenter, Streator.

Thomas Scott, sixty years old, cable splicer, 551 East Forty-sixth street, Chicago.

And what do they say? They agreed, one of them explains, that a combination was shown by the evidence, but they also agreed that it was not a combination in restraint of trade. Another said that they gave the defendants the benefit of the doubt. "We did not believe the Government had made out a strong case. The people had not suffered, and we could not see our way clear to convict." Juror Thomas did not "grasp the complicated mass of figures." Juror Clow said he and his associates "tried to be ordinary human beings, overlooking some little things in these men as we would in ourselves." "The Government's case," said Juror Gleim, "was weak for the time covered by the indictment period [three years prior to September, 1910], and was strong when the statute of limitations was in force." Another said they had been "penned up" for sixteen weeks and had found it difficult to keep well. "We were all nervous and anxious to get home." Most people who read reports of the testimony thought,

we presume, that the evidence against the defendants was ample and must be convincing. This was not the opinion of these jurors, who appear to fairly represent the average intelligence of the reputable inhabitants of a great State. It should be borne in mind that much of the evidence which has weight with the public could not lawfully have weight with the jury, because it was barred by the statute of limitations.

Still, it seems to us that if these defendants, tried before an honest jury, could not be convicted of a conspiracy or combination to allot territory, fix prices and control the great industry in which they are engaged, other prosecutions under the criminal provisions of the Sherman act will, as a rule, be unsuccessful. It may be pointed out that immediately after the acquittal of these men the prices of the commodities which they sell advanced sharply.

The results of recent civil suits for the dissolution of great combinations are not wholly satisfactory to the public, because the ends sought do not appear to have been gained, altho the final decisions were in favor of the Government. Dissolution of the Standard Oil and Tobacco Trusts has been followed by a notable increase of the market prices of shares, by the cutting of stock "melons" and by no decrease of the price of the commodities. On the other hand, these last named prices have been rising.

In all this there is an argument for official supervision and regulation, which, we think, would serve the public interest more effectively than it can be served by criminal proceedings that come to nothing or nominal disintegrations that give no relief.

The Conference of Japanese Religions

OUR readers will recall that several weeks ago we recorded the fact that the Japanese Minister of Home Affairs had asked for a conference of the representatives of the Shinto, Buddhist and Christian religions to meet him to discover if the forces of the three religions could be united for the purpose of improving the moral character of the Jap-

anese people. That conference has now been held.

The occasion for a call to such a conference needs explanation. The old and popular religion was Buddhism. The creators of New Japan had little use for any other religions; they believed them all to be superstition. But they did believe in a certain morality, but particularly in patriotism; and they made, or developed, a religion of patriotism under the name of Shinto. This taught and teaches in the school books, that the line of the Emperors of Japan is descended from the gods, and that they are to be held sacred and in a sense worshiped. Whatever success the nation has in war is due to the virtue of the Emperor. With this is the worship of ancestors, and the readiness to lay down one's life for the country. This was represented as the old religion, and was carefully inculcated, and several times a year all school children were required to bow down before the images of the imperial ancestors. Meanwhile Buddhism decayed, the temples were deserted to a great extent, while Christianity grew, but was much discredited because it seemed opposed to patriotism, since it did not teach the myth of the divine origin of the Emperor, and objected to the prostrations at the shrines. The growth of Shinto explains the hostility to Christianity and its slower growth, which was observed some years ago. Thus Shinto was the favored religion, if it be a religion, of the ruling classes, while Buddhism was the conservative religion of the common people, tho not wholly inconsistent with the acceptance of Shinto.

But of late the Japanese have begun to question whether their method of inculcating morality is effective. Foreigners complained that the merchant class are not as honest as the Chinese. Christians severely criticized the geisha system of prostitution and its tolerance and support. While these criticisms were attracting public attention there was made known the anarchistic attempt to murder the Emperor. This excited the deepest horror, as his person was sacred. The ruling class began to admit that their teaching of morals had failed, because it was not properly based on religion. It is not that they believed

more in religion, but they wished the people to believe more in it, and thus make it a force for morals. Meanwhile in Korea Prince Ito had been murdered, the highest representative of the Emperor; and very lately an extensive conspiracy to murder his successor as Governor of Korea, General Terauchi, was discovered in which a considerable number of Koreans were implicated who had attached themselves to the Christian faith, probably regarding it as anti-Japanese. There was a false report that an American missionary was arrested, but only his house was searched.

It was in this state of alarm that the Japanese Government decided to call the conference of the three religions to seek an alliance to bring the forces of religion to bear for the teaching of morals. It was a worthy motive and a proper act. But there was a good deal of criticism from those who suspected that it was the purpose to found a new eclectic religion which should merge the good points of the three. The conference met February 25, in Tokyo, at the Peers' Club. The Government was very fully represented by the Ministers and Vice-Ministers of all the departments. There were seventy delegates of the three religions in attendance, altho the chief Otani sect of Buddhism refused to be represented, as a protest against the equal treatment of Buddhism, Shinto and Christianity. It feared an attempt to give the three equal recognition by the Government, and asked what agreement there could be with Christianity? The refusal of the Otani sect is unfavorably criticized. The delegates of the Buddhist sects present were all in their rich religious robes of various colors, but the representatives of Shinto and the seven Christians were all in the ordinary European or Japanese garb.

The Minister of Home Affairs, Mr. Hara, address the representatives, telling them simply and briefly that he recognized their efforts for public morals, and that he sought their exertions to accelerate the healthy development of the spiritual world to keep pace with the progress in the material world and to improve social conditions. After social introductions the three sets of representatives withdrew separately to draw up

each a statement of their views. These were reported at a session on the next day. There seems to have been no special difficulty in coming to an agreement in each section, altho the Christian section included a Methodist, a Presbyterian, a Baptist, an Episcopalian, a Congregationalist, a Catholic and a Greek. Each section then chose one of its number (Bishop Honda, Methodist, for the Christians), to formulate a common response. This was easily done and the report was unanimously adopted, as follows:

"We recognize that in convening a religious conference, the Government authorities desired to show their respect for the inherent dignity of religion, in accord with the freedom of religious beliefs, and to cause politics, education and religion to observe their respective spheres of action in the promotion of national morals and the improvement of social ethics, without compromising our several creeds, while co-operating with one another in upholding the honor of the Imperial House and in contributing to the progress of national affairs. We highly appreciate this desire which is in perfect accord with the cause we religionists have long advocated. We hereby record our intention to exert ourselves with increased energy to fulfil our mission for the national culture according to our respective faiths and creeds, and we hope that the Government authorities will endeavor with all sincerity for the attainment of the end in view. We therefore resolve:

"To foster and develop our respective creeds in order to uphold the welfare of the state and to promote the national morals.

"To desire the Government authorities to respect religion and endeavor to remove any friction that may exist between politics, education and religion, in order to contribute to the promotion of the national destiny."

The bulk of this was taken from the answer agreed upon by the Christians, and the last paragraph from that of the Buddhists. The following day the members met at a public dinner at which patriotic speeches were made.

If there had been any intention to merge the three religions in one it was quite given up. The Buddhists appear to have been more jealous of the official favor given to the Shinto worship than they were of Christianity. We judge that the result is likely to be the reduction of any official suspicion of Christianity. Indeed, the Christian representatives asked for an annual conference, but this was not agreed to. The religion of Shinto is a very imperfect and un-

spiritual one, and we cannot think that it will be found effective for morality. Buddhism has developed into as many sects in Japan as are seen in Christianity, and some of them show a simplicity and spirituality that have borrowed not a little from Christianity, as has Brahminism in India.

Sanitary and Other. Eugenics

ATTENTION has been called during the last week or two to the proposition that none should receive a marriage license without presenting a medical certificate that they are in a fit physical condition to marry. That means that the parties to a marriage contract must not have contracted any disease either infectious or hereditary. Certain clergymen, who have had occasion to know the evils which have followed such insanitary marriages, have declared that they will insist on medical certificates of health before conducting the marriage ceremony, while others have as positively objected to any such inquisition.

The purpose of such a requirement is certainly right, difficult as it would be to secure it except by law. It is as legitimate to require by law that the parents on both sides should know the physical health of the parties as that they should be informed thru a required license that the marriage is intended. In a multitude of cases one party, after marriage, has contracted disease from the other, or children are born of no value to the State, and sure of premature death from parents that never should have married, and whose own lives have been a tragedy. So long as the State does not require a certificate of health, at least the parents of the bride should have the fitness of the groom medically certified; and tuberculosis is not the only or worst disease to be guarded against. So long as our cities allow houses of infection and vice to exist the least that can be done is that parents should protect their daughters in marriage.

In marriage two purposes are in view. One is mutual comfort, sympathy and aid. It is not good for man or woman to be alone. The other is, the maintenance of the human race by assuring

the succession of generations. Of these two purposes of marriage the latter is far the more important. The former is a self-seeking purpose; the latter is a blessing to society and a necessity for humanity. In these days the former purpose is too much considered, and it is even thought by many undesirable and hardly decent to have children. The main purpose for which wise Nature ordains marriage is thus obscured and annulled by those whose selfish love of ease and of themselves sets them in conflict with the highest laws of Nature.

Have such people ever thought out what would be the result in the end if such childless marriages, or marriages with but one or two children, should prevail? Remember that humanity is the only thing worth while in this world. Man is the only living creature that has the power of thought, that can see beauty, or reason, or right. Were men to perish from the world, there would be no one to admire a brilliant sunset, or to utter a word of love, or to feel a fine emotion, or to worship God. Civilization would come to an end; art and industry would cease, our fields and even our cities would revert to the savage forest, and wild beasts would usurp the rule of man. We should go back to the geologic Eocene Age, to the time when "a monstrous eft was of old the lord and master of earth." That we should revert to that age is a thought too terrible to dwell on, and yet we must dwell on it, for man is moving toward it. "He now is first, but is he the last? Is he not too base?"

So let us consider for a moment toward what we are moving, we who scorn Mr. Roosevelt's wise warning, and follow the example which is frightening France and which is decimating what was the best breed of the country. Let us do a little ciphering. Let us suppose, with an advancing culture and luxury, that we have a thousand young married people, five hundred couples. Perhaps, because of disease or purposely, one hundred of them will have no children. Of the four hundred couples remaining many will have only one child, others two, and a few three or even four. An average of two is perhaps as many as

can be expected. That gives eight hundred children. But of these at least two hundred, with the best of care, will die before they are of marriageable age, leaving six hundred. Of these, as things go now, two hundred will live unmarried or will not marry till late in life; that leaves four hundred, or two hundred couples, to be the parents of the next generation, five hundred reduced to two hundred. In two or three generations more this branch of the race becomes extinct. Their town, if we suppose them to have occupied a town, has run to weeds and woods.

Does this picture seem extreme? Not so very. Does not every city show its army of young men and women crowding our avenues of industry, but not marrying? Do we consider that in order simply to keep up the present population by replacing the present generation, every man and woman should marry, and then every couple have three children, of whom two should live and marry? Of those we know, how many have three children, while they need to have four or five to make up for those who refuse the responsibility of marriage?

The substance of what we wish to say is this, that the first great duty of the human race is to perpetuate itself against extinction. That duty is primal; after that comes the duty to make the race happier and better. That duty rests on the collective conscience and also on the individual. The alternative is the rule of the beast instead of that of man. That duty rests most on those who know most, on the most intelligent, the best educated. It would be a shame if they should conclude to give over the succession of the generations to the ignorant, the stupid, the unfit. Thus civilization would decay in rotten luxury of wealth. Perhaps it would be well if in a new "*Carmen Seculare*" we might offer our prayers that a fresh conscience of marital duty might preserve and multiply a worthy citizenship. We say sometimes, "to the last generation"; let us not reduce their number. Man, man only, is what gives value to the world; and yet there are those who prefer to raise calves and pigs, or lead a lapdog.

Easter The Easter celebration does not mean the opening of spring, with its greening grass, its snowdrops and crocuses, and the blossoming of gayer hats. There may have been such a festival in classic lands before the Bethlehem stable was celebrated in story and song, but Easter no more means that the sun has crost the equator than it means the Jewish passover. It means not vegetal resurrection, but human immortality, prefigured in the resurrection from the dead of Jesus Christ. The Christian faith is one of assurance of eternal life brought to light in the gospel. It forbids hopelessness, it bans suicide, it announces life after death, a higher, nobler life with Him who rose from the dead. We speak not of those who yet live in the pagan age and see in Easter only the bonnet and the bloom; for such there are. They miss, in their blind way, the true significance of the season, which is religious, and no matter of equator and ecliptic. It is a dear figure that relates the resurrection of our Lord, and our own, to the resurrection of nature in spring; but that is a cold heart, a thin and arid heart, that will not rise beyond the type and metaphor to rejoice in the one blessed hope which has given us life and immortality in the gospel of Him who carried captivity captive and assured this chief gift of comfort to man.

A Correction We have received from the office of the United Shoe Machinery Company, a letter correcting a few words in our editorial, "A Mischievous Decision," in our issue of two weeks ago. We then said of that company that "it increases the price of every pair of shoes by perhaps half a dollar," and that "it requires the use of its unpatented buttons and fastenings" with its leased machines. The treasurer of the company, Mr. L. A. Coolidge, assures us that it "has nothing to do with buttons," and that "the button-fastening machines, about which there has been some comment, are manufactured by companies which have never had any relation whatever to the United Company." As to the profit of the com-

pany from its machines, we are informed that it is no more than $1\frac{1}{3}$ cents per pair for ordinary shoes, when all machines of the company are used, and only $5\frac{1}{2}$ cents on the highest grades; and the average royalty is only $2\frac{2}{3}$ cents, which covers installation and care of machines and instruction of operatives. Indeed the item of machinery is the only one in which the cost is less than when the company was organized in 1899. It has always aided competition by manufacturers by refusing to allow rebates from the larger manufacturers, and no business in the country has more competition.

St. Thomas. If there is now any chance of buying the island of St. Thomas from the Danish Government, we heartily support the proposition. Those outlying West India Islands ought not to be partitioned under various European Powers, English, French and Danish, with others independent or belonging to the United States. They form one group, but are differently governed, under separate commercial regulations, and would have more prosperity and a better civilization if they were assimilated. By their position they are under the influence of the United States, and the acquisition of Porto Rico by us, and the putting of Cuba under our protection, have been of much benefit to them. Some years ago we came near purchasing St. Thomas, but the Danish Rigsdag declined the sale. There are those who say that now negotiations would have more success, and it is plain that if the island is on the market—and it is of no commercial value to Denmark—it ought to be purchased by us, rather than allowed to be an occasion for dispute over the Monroe doctrine, if sought by any European Power.

After the British Strike This week, we trust, settles the great British coal strike, the most perilous conflict Great Britain has seen for a century. It shows us the power of combined labor. The unions have now learned what they can do, and at another time they may press their power to the given limit, with a result which we do not care to forecast, perhaps the seizure of the mines by the

Government, perhaps civil war. What would have been the result if such a strike had occurred at the outbreak of an unpopular war? Have not the working people found a weapon by which they could, if they would, paralyze any war? But assuming that the ordinary course of British industry will be resumed after this bitterness and the loss of hundreds of millions of wealth, we turn to the next great stage in the reorganization of the British Constitution, which is the act for the government of Ireland by a local parliament. The bitterness of the conflict over this measure as yet undivulged we can hardly conceive. Ulster declares she will not submit. Yet the measure is almost sure to go thru with no great delay, and we shall see whether Ulster will fight. The Protestant Ulster men have convinced themselves that they are to be oppressed by the Irish Catholics, but exactly how is not clear. In Massachusetts the big cities are Catholic, mostly Irish Catholic, but the country districts, which are Protestant, suffer no religious oppression. Mr. Redmond, the leader of the Irish members of Parliament, knows what the features of the bill to be presented are, and he declares that it will be a great measure, that it will pass the House by a majority of over a hundred, and will become a law despite the House of Lords. It will have, he predicts, the full Liberal and Irish vote. It may be a great bill, but it would be a greater if it could only give home rule to England, Scotland and Wales as well as to Ireland.

Hope in Defeat The failure of the House of Commons to pass the Conciliation Bill, giving qualified suffrage to women, and the failure of the suffrage bill in the New York State Assembly, give hope more than discouragement. In Albany the bill allowing suffrage for women, to be referred to the people, prevailed by a vote of 76 to 67, and then was reconsidered and laid on the table by a vote of 69 to 67. It is plain that a number of those who had promised the women to vote for them were only lukewarm advocates and were satisfied to have kept their unwilling promise, but dodged on the reconsideration, which they had planned for. It was another case of Birnam Wood going to Dunsinane, where the

promise was kept only to the ear. But the handsome vote for women assures a victory another year. It was by a narrow margin—208 to 222—that the suffrage bill failed at the second reading in the British House of Commons. There is little doubt that it would have prevailed but for the shocking violence of the London suffragets. And yet the militant women now declare that they are pleased that the bill failed, because it did not give the suffrage to women on the same terms as to men. It gave it to every woman who had the household qualification, which would include a million women. A year ago the same bill past the second reading by a large majority, but this year not only had the women with hammers and stones prejudiced it, but the Irish members voted against it, because its further discussion would delay the passage of the Home Rule bill. Justice is simply delayed.

It is worthy of notice that thus far, after forty years, not one of the higher institutions for the education of negroes has more than a meager endowment. Much money has been given them by individuals and by missionary societies for buildings and current support, but very little for endowment, such as has been given to Hampton and Tuskegee institutes. We are glad to see the effort making to raise for Fisk University, Nashville, an endowment of half a million dollars. At the public meeting in its behalf, at the Broadway Tabernacle in this city, April 14, the announcement will be given of a conditional gift of \$100,000 by the Carnegie Board, and the outlook is promising. Most unfortunately President Gates's severe railroad accident a few weeks ago withdraws him for the present from giving his aid to the effort.

Mexico is having a critical year. President Diaz during his long term as President had not educated Mexico for genuine self-government, had not given really free elections. Now a second revolution is in progress, following what we had hoped would be the conclusive revolution of Madero. Our Government wants peace there, and so wants Madero

to retain his power. We do not wish to intervene, and it is well that so careful a man as President Taft is Commander-in-Chief of our Army and Navy. He did admirably in Madero's revolution, and we may be sure he will not intermeddle now till he has to. But American interests and life will be protected, tho only at the last resort will our Government intervene, as we had to do in Cuba and then withdrew.

We like Mr. Bryan's straightforward positiveness. He declares that if the Nebraska Democrats want Governor Harmon for President he will refuse to be a delegate to the convention, for Governor Harmon is, he says, "a reactionary, whose nomination, if secured at all, will be secured by Wall Street influences." He does not say that if Mr. Harmon is nominated he will not follow his party, but we may be pretty sure that he would retire to his tent. It is not likely that either he or Mr. Roosevelt would organize a rebellion in the party, but their several attitudes are very much alike.

An unusual privilege has been secured in the visit of Prof. Gilbert Murray, the distinguished head of the department of Greek in the University of Oxford, who will give a series of public lectures on the Greek drama during April and the first of May, at Amherst College, with a series of lessons to the students of Greek. This is an unusual opportunity, and ought to help withstand the heresy that classic studies are of little use in these days. Professor Murray stands at the head of English scholarship and he will be heard elsewhere also.

One after another the great public service companies are doing justice to their worn-out employees by establishing a pension fund. The last of these is the Bell Telephone Company, at a cost of from \$300,000 to \$500,000 a year, says President Vail. But the United States Government still refuses to pension any of its civil servants, altho the secretaries of the departments and the Presidents of the United States have often urged it. Why is not an internal revenue officer as valuable as a soldier?

INSURANCE

Workmen's Compensation

DURING the past three or four years there has been a steadily growing sentiment in this country in favor of compensating industrial workers for bodily injuries received in the course of their occupations. Under the phrase, workmen's compensation, which has lately become very common in our daily terminology, there reposes something of a revolution in our legal and commercial customs. Heretofore an injury sustained by a workman was not, so to speak, *prima facie* evidence of his title to indemnity by his employer. He had to show satisfactorily that the employer was at fault. The latter had his defenses at common law. This order of things is rapidly passing away. We grow more human and less individualistic. Our workmen are, in a way, falling under the guardianship of the State.

The policy is rapidly crystallizing that the injured workman who is honestly injured—and by honestly injured is meant that the misfortune is not the fault of his own immorality—is entitled to compensation, regardless of the causes thru which the injury is inflicted, whether his fault, the fault of his fellow employees, or the fault of his employer. He is rendered physically incapable; there must exist somewhere a source of pecuniary relief. That is the doctrine.

Under most European forms of government this policy is eminently sound; under our system it is regarded by the greater number of careful students as sociologically inconsistent. The latter hold, for example, that, unless we are prepared to go to the logical limit and admit that every person who is disabled is entitled to indemnity, there is no reason why an exception should be made in favor of workmen employed in industrial occupations. They admit that the demand for compensation to workmen rests on a humanitarian foundation, but insist that it is one-sided and so incomplete as to render it irrational and unworthy of approval.

It is plain, however, to those who have carefully observed the course of events that the new propaganda goes marching steadily on, and will so continue until, in

the course of time and thru the processes of experimentation, it becomes measurably perfected.

In the meantime, the insurance companies, which have been carrying the hazards incident to the liability incurred by employers thru injuries sustained by their employees, are facing a serious problem. All their accumulated experience is the fruit of a different order of things and has suddenly become almost worthless as a guide in future transactions. A merely superficial observation of the situation indicates a tremendous augmentation of the hazards. To what extent they are increased cannot be foretold. All of them which possess careful underwriters—men of experience and vision—will go forward with circumspection. Liability insurance, by reason of its characteristic of continuous coverage during a long period of time and the large reserves necessary as a consequent provision against it, is a peculiarly dangerous business to invested capital. The men who are guiding the leading companies are seriously at the work of solving the problem which has been set them by the workmen's compensation laws already enacted, and it is safely to be presumed that—provided the laws of the various States can be reduced to some sort of uniformity—they will eventually formulate a system of protection that will be satisfactory to employers and profitable to themselves.

JOHN B. LUNGER, vice president of the Travelers' Insurance Company, of Hartford, Conn., has just been elected vice-president of the Equitable Life Assurance Society of New York. Mr. Lunger was born in New Jersey in 1864 and received his education in Hackettstown, N. J. In 1880 he entered the employment of the Prudential Insurance Company, where he engaged in mathematical work, but soon was promoted to the actuary's department. In 1886 he became supervisor of both the office and field work of one of the branches of the company. In 1897 he accepted the position of managing actuary of the New York Life Insurance Company, which position he resigned February 1, 1902, to accept the vice-presidency of the Travelers'.

FINANCIAL

Securities and Trade

On the New York Stock Exchange last week 4,726,000 shares were sold, the number for the preceding week having been only 2,777,000. Monday's total was 1,119,761. A majority of the net changes for the week were advances, and the losses were small. Last week, as also throught the month of March, there was evidence of underlying strength. Prices responded to news regarded as favorable, such as the acquittal of the beef packers, and were very slightly affected by unfavorable events, such as the labor controversies. For the full month, there was an average advance of $3\frac{1}{2}$ to 4 points for active railway stocks, with an average addition of about 6 points for leading industrial shares. The news, on Wednesday, that the Steel Corporation was borrowing \$30,500,000 by a sale of bonds of subsidiary companies was at first depressing, but the prevailing optimism soon asserted itself, and it was pointed out that the Corporation's action assured a maintenance of the dividend rate on the common stock. This sale of bonds is made because last year's net earnings were so small that appropriations from them for additional property and new construction were prevented. About \$20,000,000 will be needed this year for extensions already authorized, and increase of business calls for \$17,000,000 additional working capital.

The strength of the stock market for some time past, in the face of somewhat discouraging news, appears to have been due largely to a change of sentiment in the world of trade and investment, a growth of confidence which successfully resists the depressing influence of coal strikes or the bitterness of controversies in national politics. At the same time it should be noted that there is decided improvement in one great industry. At present the great steel mills of the Pittsburgh district are operated almost to the limit of their capacity. Output in that district made a new tonnage record in March. There has been a slight increase of prices. In general trade continued growth of confidence and some improvement are reported. The tendency is for-

ward and upward, but on conservative lines.

Railroad Property Values

THE Republican and the Democratic members of the House Committee on Interstate and Foreign Commerce have united in reporting a bill authorizing the Interstate Commerce Commission to make a physical valuation of all railways engaged in interstate traffic. This unanimous support indicates that the bill will become a law. It is a measure of much importance. The proposed valuation would consume at least three years and cost from \$3,000,000 to \$4,000,000. While we do not think that it should be the sole guide in determining rate questions, the information should be procured for the Commission's use. If the work is taken up, there will be some surprises in the reported values.

....Interest and dividend disbursements in April by railroad, industrial and traction companies, as compiled by the *Journal of Commerce*, will be \$150,486,600, an increase of \$8,767,605 over those of April, 1911.

....A Tokyo journal, discussing the proposition for an international inquiry as to prices, publishes statistics showing that the average price of commodities in that city has risen 26 per cent. since 1899.

....David M. Morrison, president of the Washington Trust Company since its organization in 1889, has retired from that office and been elected chairman of the board. The new president, Francis H. Page, has held successively the offices of secretary, second vice-president and vice-president, and, like Mr. Morrison, has been connected with the company since its organization twenty-three years ago. The capital, surplus and undivided profits of the company amount to \$1,800,000. Among the directors are Phineas C. Lounsbury, George W. Jenkins, William Barbour, William A. Nash, Walter E. Frew, George E. Ide, John P. Munn, John J. Pulleyn and Clarence W. Seamans.

The Independent

VOL. LXXII NEW YORK, THURSDAY, APRIL 11, 1912

No. 3306

Survey of the World

For Economy and Efficiency

President Taft sent to Congress on the 4th a message on economy and efficiency in the Government service, recommending changes which would save more than \$11,000,000 a year. His most striking proposals are that all the local officers of the departments of the Treasury, the Post Office, of Justice, of the Interior and of Commerce and Labor, be placed in the classified service under the merit rules; that the Revenue Cutter Service be abolished as a distinct organization, provision being made for a distribution of its equipment among other services requiring the use of marine craft; and that the Life-Saving Service be discontinued as a separate organization, the maintenance and operation of the life-saving stations being made duties of the Bureau of Lighthouses. Very substantial economy would result, he says, "from putting experienced and trained officers in charge of the first and second class post offices, instead of selecting the postmasters in accordance with the present practice." There would be great saving in salaries, with additional saving due to increased efficiency, "if these officers were embraced in the classified service and required to devote all their time to the public service." Similar benefits would be gained in the Internal Revenue and Customs services, where "large expenditures are made for salaries of political appointees." Pension agents should be in the classified service; the change recommended would give to one person the work now done by two. The office of receiver of a district land office should be abolished; the register, assisted by a clerk, should do the receiver's work. All marshals and deputy marshals

should be under the merit rules. There should be only one treasury auditor, instead of six. In the handling of correspondence, briefing and press copying should be eliminated. There should be a centralization of the distribution of Government publications. Reasons for all the proposed changes are given, and with respect to most of them the annual saving is estimated. At the conclusion of the message, the President urges Congress to appropriate the \$200,000 needed for the work of the Economy and Efficiency Commission in the coming year, and the \$50,000 required for the publication of results.

Municipal Elections At the municipal election in Milwaukee, on the 2d, Dr. G. A. Bading, candidate of the combined Republican and Democratic parties, was elected mayor by a majority of 13,000 over Emil Seidel, Socialist, who has been mayor for two years. Nearly 80,000 votes were cast, against 60,000 when Seidel was elected. In the new Council the fusionists will have twenty-six members and the Socialists eleven. It is expected that a law will now be enacted to permit Wisconsin cities to hold elections without regarding the old party names and lines. The campaign was a bitter one, the victorious majority striving to make the contest one between the red flag and the Stars and Stripes. In Montana the Socialists lost ground in Butte, where the present mayor is a Socialist. They carried only one of the eight wards. In Lewiston they lost the one ward in which they were successful a year ago. Peter Stewart, Socialist, was elected mayor of Hartford, Ark., and is the first Socialist mayor in that State.

The voters of Girard, Kan., which has been regarded as a stronghold of socialism, elected a Democratic mayor by a vote of nearly 3 to 1. In Flint, Mich., Menton, the present Socialist mayor, was defeated by Mott, fusion candidate. Socialist aldermen were elected in Dowagiac, Kalamazoo and Battle Creek. In Illinois the Socialists will have three aldermen in Belleville, one in Peoria and one in Quincy. In Chicago's new Council there will be twenty-six Democrats and ten Republicans.

✻

National Politics At the beginning of the present week the managers of Mr. Taft's canvass claimed for him 280 delegates. This week 160 more are to be chosen, and it is expected that he will have a large majority of them. The number elected on the Democratic side is still comparatively small. — Mr. Roosevelt denounces the New York primaries as "an infamy unmatched even by the kindred infamies perpetrated in behalf of President Taft in Indianapolis and Denver." Speaking at Louisville on the 3d, he sharply criticised the record of the Taft Administration and virtually asserted that Mr. Taft was a reactionary, the candidate of bosses. Three days later he attacked Joseph H. Choate and other eminent lawyers who have organized a movement in disapproval of the recall of judges or court decisions. Senator La Follette, who easily won a victory at the primaries in Wisconsin, has begun a three weeks' tour in the Middle West and Pacific States. The old officers of the New York Republican Committee have been re-elected, and the prediction is made that the platform to be adopted by the State convention will oppose a third term and the recall of decisions. Speaking in Louisville, on the 6th, Mr. Clark frankly asked for the support of Kentucky. Mr. Underwood has the delegates from Alabama. Some are led by Mr. Bryan's recent utterances to think that he would bolt the Democratic ticket if Mr. Underwood or Governor Harmon should be nominated. Governor Wilson has been making speeches in Illinois. On the 6th, in Chicago, he paid tribute to the heroes of Poland, adding that he was not doing this because lies had been told about his

estimate of Polish immigrants. He also said:

"The control of credit is dangerously concentrated. The money resources are not at the command of those who do not submit to the domination of small groups of capitalists, who wish to keep the economic development of the country under their own eye and guidance. The great monopoly in this country is the money monopoly. So long as this exists, freedom and individual development are out of the question."

He has asked for the withdrawal of his name from a Populist ballot in Nebraska.

✻

Congress The House, on the 1st, by a vote of 189 to 92, passed the Underwood bill, revising and reducing the tariff on wool and woolen goods. This is the bill that was passed last year. After it had been modified in the Senate, the President vetoed it. This time only one Democrat was counted in the negative, and 20 Republicans of the Progressive group voted with the majority in the affirmative. It is understood that there will be no more tariff legislation in the House at this session. Debate in the Senate upon tariff bills will begin on the 15th. The Republicans of the Finance Committee have submitted an adverse report upon the bill affecting the rates on iron and steel. Cane sugar planters in the South, producers of beet sugar in the West, and the people of Porto Rico, protest against the bill which makes raw sugar free. In the Senate, Mr. Bristow, Progressive Republican, has introduced a substitute which slightly reduces the present duty on raw sugar. — Mr. Taft, addressing the convention of the Cotton Manufacturers' Association on the 3d, said:

"We are in this country, in respect to every business, on a protective tariff basis. I do not mean that every business needs a protective tariff to enable it to live, but that there are so many businesses dependent for life on a protective tariff that to take it away would disturb the whole business foundation of the country."

He urged the manufacturers to exert their influence in behalf of the Tariff Board. — The bill establishing a Children's Bureau in the Department of Commerce and Labor was passed, 173 to 17, in the House, last week. The Senate had already passed it. This bill provides that the bureau shall make in-

quiries and reports on all phases of child life, with especial reference to dependents and orphans. It has the support of Jane Addams and other philanthropists. Senator Bailey opposed it.—On the 3d the Senate passed the bill imposing a prohibitive tax on matches in the manufacture of which white or yellow phosphorus is used. The purpose of it is to save employees from the disease known as "phossy jaw."—Mr. Sulzer's bill, creating a Department of Labor, whose head shall be a member of the Cabinet, has been favorably reported in the House, and a favorable report on the bill for an eight-hour workday in all work done for the Government has been ordered in the Senate.—As a result of the Florida Everglades inquiry in the Department of Agriculture, C. G. Elliott, formerly chief of drainage investigation in the department; Allison D. Morehouse, who was an assistant chief; Ray P. Teele, formerly an assistant chief of irrigation investigation, and Frank E. Singleton, accountant, have been indicted. The first two had been dismissed by Secretary Wilson and the third had resigned.

Trust Cases Senators Borah, Nelson, Brown, Culberson and Cummins, a minority of the Judiciary Committee, have submitted a report in which they assert that the recent dissolution of the Tobacco Trust has not restored competition, but has really given new strength to the combination, tightening its grip on the independents. They support the Cummins bill, which would permit the independents to intervene in the case and to appeal to the Supreme Court. A majority of the committee say this bill is unconstitutional.—A bill suggested by the two suits of the Government against combinations of foreign steamship companies (the first relating to the Atlantic steerage compact, and the second to trade with the Philippines, Japan and China) has been drafted by Attorney-General Wick-ersham and introduced in the House. It provides that any steamship owned or controlled by a person or persons found guilty of violating the Sherman act shall be forbidden to enter or clear at any port of the United States, the penalty being a fine of \$25,000 for each offense; also that

the Postmaster General may cancel a mail contract held by the company owning such a ship.—It is understood that in the negotiations with the Government the International Harvester Company proposed a division of itself into two companies, which should compete, and that the proposition is disapproved by the Department of Justice.

Labor Controversies It is expected that the 400,000 bituminous coal miners will remain idle until the 22d, and then return to work. The 175,000 anthracite miners await the result of a conference on the 10th. They care more for recognition of the union than for an increase of wages. The number of union members in good standing has been falling, because of failure to pay dues. Recognition that will involve the collection of dues by the employers is desired. That is to say, the union leaders ask that the employers shall withhold the dues from wages and pay the same to the organization. At the end of last week they were also demanding the closed shop.—An increase of wages amounting to about \$10,000,000 a year at the New England cotton mills has been followed by an advance of $\frac{1}{2}$ cent per yard in the price of goods.—In Chicago and neighboring cities 15,000 carpenters are on strike for an addition of 5 cents an hour. Building operations involving an expenditure of \$40,000,000 are affected.—In Utica, where 3,000 cotton mill workers are on strike for an addition of 15 per cent., violence has required the presence of three companies of troops. There have been riots at Passaic, N. J., where the striking silk weavers are led by William D. Haywood.—The police officers of San Diego, Cal., assisted by many armed citizens, have expelled about 125 Industrial Workers of the World (who admitted they were anarchists), having first compelled them to kneel on the ground and kiss the American flag.

The War in Mexico A courier came to Orozco, on the 1st, from Zapata in the south, offering an alliance. The offer was accepted. Zapata said he had the capital at his mercy, but would wait for

Orozco. One of the latter's generals, Campa, attacked Parral, expecting an early victory. A forward movement to Torreon was to follow. But Campa was whipped and driven back. This was on the 2d. When the second attack was made, on the 5th, the town was easily taken, for the Federal troops had withdrawn from it. At the end of the week Orozco was planning his attack upon Torreon. Madero sent confident messages to London. There was trouble only in Chihuahua, he said, and the strength of the rebels there was diminishing. In a message to Congress he asserted that recruiting would soon give him an army of 60,000. He deplored rumors in unscrupulous newspapers about intervention. Our Government had assured him that it did not intend to interfere. Intervention would mean war to the death. Congress received his message with approval. At the same time, however, it loudly cheered a member's eulogy of Diaz and voted unanimously to make a legal holiday of the date of one of Diaz's victories, many years ago, in Puebla. De la Barra landed at Vera Cruz, where he spoke to friends briefly and with caution. In our Congress a bill has been introduced—at the suggestion of the Government, it is said—to amend the laws so that State militia may be sent out of the country for service. Three representatives of Orozco have come to New York. Two of them are lawyers. Their mission is to explain that his cause is just. A resolution reported in the House at Washington directs our Government to press for the payment of claims on account of the killing of peaceable Americans on our own soil by Mexican bullets during the battles near Douglas, Ariz., and El Paso, Tex., some months ago.—Referring to Senator Lodge's resolution of inquiry as to a reported purchase of land at Magdalena Bay by the Japanese Government or a Japanese company, Marquis Saionji, the Japanese Prime Minister, says that the Oriental Steamship Company acquired from Mexico fishing rights along the west coast, between Tepic and Oaxaca (far south of Magdalena Bay) and transferred them to the Oriental Whaling Company. President Madero and the Marquis agree in saying no purchase on the bay has been

made. It is reported that land on the bay, held by a California corporation, has been offered to a Japanese company by the American owners.

Central and South America

The State Department at Washington announces its approval of the agreement between Honduras and the Whitney Central Trust and Savings Bank, of New Orleans, relating to a loan of \$6,000,000 under the terms of the convention now pending in the Senate. This agreement followed the recent withdrawal of an offer of \$10,000,000 by J. P. Morgan & Co. and associated interests in New York. The New Orleans loan is to be used exclusively for refunding or paying the foreign debt; part of the Morgan loan was to be used in building railroads. William C. Sheldon & Co., of New York, are associated with the New Orleans bank in the transaction. —General Leonidas Plaza has been elected President of Ecuador. He was President from 1900 to 1904, and he commanded the Government's army during the recent Alfaro revolution.—In Paraguay, the new Government has sent troops to attack Colonel Jara (formerly Minister of War and President), who commands the only group of revolutionists now in the field.—Letters from Rio de Janeiro to official papers in Berlin warn Germany against efforts now being made by the United States to obtain from Brazil larger tariff concessions on American goods exported to that country, and also say that German trade is in danger of being hurt by a Brazilian subvention to a line of steamships between Rio and New Orleans.—Secretary Knox went from Porto Rico to Hayti, where he urged the people to maintain peace and develop their country. President Leconte said Hayti needed more Americans and American capital. Hayti resents Santo Domingo's accusation that it has assisted the rebels in the latter's northern provinces. From Hayti the Secretary went to eastern Cuba, where he visited the San Juan Hill battlefield. It is said that he avoided a delegation of negroes who desired to protest against President Gomez's decree forbidding the organization of a negro party.—A committee sent by the

Porto Rican Assembly to protest against the proposed removal of the duty on raw sugar has arrived in Washington and been introduced to the Senate Finance Committee by Secretary Stimson, who confirmed the assertion of these delegates that the proposed legislation would ruin the island's sugar industry. They say that the growth and prosperity of the industry have been of great importance to the people of the island, and that the House bill caused almost a panic in Porto Rico, bankers withholding credit from the planters.—The New York Chamber of Commerce has voted a protest against the pending bill which would exclude from the Panama Canal the steamships of a company in which a railroad company has an interest. "This," the Chamber says, "would prevent the use of the canal by the largest owners of American steamships and would prevent the further building of steamers in American yards for their service."

British Affairs

An almost complete resumption of work by the British coal miners was expected to occur during the week following Easter. By a vote of 440 to 125 the Miners' Federation accepted, on the 6th, the recommendation of the executive committee that work should be resumed. The extremists attacked this proposal as cowardly, but were voted down. The strike is said to have cost the miners themselves \$50,000,000. The funds of their unions have decreased by \$6,029,000, leaving only \$3,941,250, chiefly in securities, in their possession. The vote of the miners on the general proposition of returning to work is said to have been about 175,000 to 150,000 in favor of resumption. Scarcely half the men voted. Rioting occurred last week in several districts, but there was a constant gain in the number of men working.—In introducing the budget in the House of Commons on April 2 Lloyd-George, Chancellor of the Exchequer, said that the coal strike had so far cost the Government \$200,000 in revenues, not counting a loss to the post office of \$300,000. It is said unofficially that the Government has laid aside the realized budget surplus of £6,545,186, a record breaking figure, with the intention of using it for the in-

crease of ship building if the German naval program is increased. It is reported in other quarters that the sum is set aside to finance the Irish home rule scheme. The bill providing for home rule is now ready for Parliament, and will also be submitted to an Irish Nationalist convention to be held in Dublin. The new Irish Parliament will, it is said, have power to vary the rates of custom duties, while it will not be allowed to vary the articles dutiable. Customs and the excise will for six years be collected by the Imperial Parliament, while the Irish Parliament will be denied the power to impose duties against British goods. The Irish Parliament will sit at Dublin, and will consist of two houses, one entirely elective and the other consisting of thirty-eight elected members and twelve members to be nominated by the Crown. Forty Irish members, six of them representing Dublin, will sit at Westminster, in the House of Commons. Ireland will make no direct contribution to the Imperial revenue. Old-age pensions and the land purchase scheme remain under British responsibility. Religious freedom is guaranteed. The Lord Lieutenant will continue to hold office on the nomination of the Crown, and will have the right to veto Irish legislation when instructed so to do by the Imperial Parliament, which also reserves the right to repeal an unjust act of the Irish Parliament. The Privy Council, too, may declare such an act void. A protest against home rule, planned by Bonar Law, the new Unionist leader, was scheduled for April 9.—Mrs. Pankhurst has been released on bail of \$10,000 pending her appearance at the Old Bailey Sessions on the charge of conspiracy and inciting to commit malicious mischief.

The Continent

The German Emperor has lately visited the King of Italy at Venice. Enthusiastic demonstrations greeted the appearance of the two sovereigns upon a balcony of the palace. It is reported that a renewal of the Triple Alliance was effected. Before going to Venice William II visited Emperor Francis Joseph, of Austria-Hungary, at Schönbrunn. A parliamentary crisis in Hungary, over the refusal of the Aus-

trian Government to recognize Hungarian claims to control the calling out of the joint army reserves, led to Francis Joseph threatening to abdicate as King of Hungary. Unprecedented attacks upon the sovereign and his heir, the Archduke Franz Ferdinand, followed in the Parliament, and a former Minister of Justice declared that the abdication might just as well take place. The loyalists were furious at the attacks made by this speaker, M. Polonyi, and others. Thus far the Khuen von Hedervary ministry has remained in office. The Prime Minister offered his resignation on March 7; it was then refused, but now it may be repeated and accepted. —On April 1 the young Prince of Wales arrived in Paris, traveling as "the Earl of Chester." He is to spend several months there in the household of the Marquis de Breteuil and his American wife, seeing little of Parisian society, and having for mentor M. Escoffier, professor at the School of Political Sciences. The young prince has visited the principal monuments and various quarters of the city. He will receive instruction in the practice of the French language and in international law. Altho it is his parents' wish that he attend no races, the French newspapers express the hope that the heir to the English throne will, like his grandfather, Edward VII, come to love Paris. —More motor car and highway outrages are reported from Paris. Several important arrests have been made. —French artists have subscribed \$10,000 for the purchase of a military aeroplane, which will be named after Leonardo da Vinci, who, besides being a great painter, made a study of the theory of flying. —The Portuguese republic is now negotiating a loan of \$50,000,000 with a group of British and French financiers. Evidences multiply that the financial and political condition of the Government is unsatisfactory, and there are repeated rumors of European intervention. Strikes and riots constantly recur, 20,000 textile workers of Lisbon and Oporto being out now, demanding shorter hours and higher wages. Farm laborers in the Mirandella region are on strike, and so are the lightermen of Lisbon. Fatal

bomb explosions occurred at Oporto last month, the work of a secret society. The suppression of the manufacture of bombs has been undertaken by the Government and discussed in the Chamber of Deputies. The new regime is apparently less popular than at any time since its establishment in October, 1910. Evidences of royalist movements on the frontier have given the republican Government cause for activity. On March 17 the Prime Minister published an extract from the Anglo-Portuguese treaty of alliance. Neither Power will help another nation in attacking the other, or give asylum to enemies of the other, except political fugitives or exiles. In case of war or invasion either party to the treaty will assist the other by land and sea. —Election riots at Langaza, resulting in the death of ten persons, including one of the gendarmes who charged the mob, and a strike of 4,000 employees of the Northern Railway, in and near Valladolid, are reported from Spain. Work has been resumed on the Canfranc Tunnel, which will pierce the Pyrenees. This line reopens a Roman road, and the mountain crest is passed at Somport — *Summus Portus*. Contracts have also been let for a railroad between Ripoll and Puycerda, completing the only unfinished section of the line to connect Toulouse, on the French side, and Barcelona.

✱

From latitude 87 degrees 32 minutes south

In the Antarctic Captain Robert F. Scott, the British Antarctic explorer, has sent to Akarao, New Zealand, an account of his experience in south polar regions, from January 25, 1911, to January 3, 1912. This narrative was despatched by his ship, the "Terra Nova." On January 3 he was within 150 miles of the South Pole, and was "going forward with a party of five men": Dr. Wilson, chief of the scientific staff; Captain Oates, of the Inneskillen Dragoons; Lieutenant Bowers, Royal Indian Marine, and Petty Officer Evans, R. N., being his companions. They carried a month's provisions, and "prospects of success seem good." Lieutenant Shackleton "has no doubt" that Scott

reached the Pole about January 18. Scott met with greater difficulties than Amundsen, who in his expedition kept under the lee of King Edward Land. While returning to his base after laying depôts, on February 16, 1911, one of his dog teams fell into a crevasse, and the commander had an almost miraculous escape from death. This was only one of various hair-raising adventures. Captain Scott owes much to the excellence of his equipment and personnel. For two months at one stretch the explorers lived on seal meat. During the four winter months the temperature registered, at times, 50 degrees below zero. Usually it was nearer minus forty. In winter quarters at Cape Evans every one was kept busy with station and scientific work, exercising the animals, playing football, and lecturing or listening to lectures. In spite of their big loads, the ponies used on the expedition went well and maintained good health, tho it is doubtful whether ponies are equal in value to good dogs. Some of the ponies were shot to feed the dogs. Fifteen miles of telephone wire were used by the explorers in reporting to one another the weather and their movements. A motor sledge was found useful, and several of the party sledged to Cape Crozier to study the incubation of the penguins and their habits. Bituminous coal and fossils, probably crustacean, also great masses of marble and topaz, were found. Thousands of wingless insects of two different species were discovered. Lieutenant Shackleton thinks that these are the first land insects to be found in south polar regions. Marine biological work was also carried on, holes being bored in the sea ice to let down nets. Many thousand feet of film were used to obtain permanent records of bird and animal life. The "Terra Nova" will turn south in November, and it may be several months before further news from Scott is received. Meanwhile, Captain Amundsen has reached Sydney, N. S. W.

The Near East The Turks claim to have won a great victory on March 27 over the Italian army near Tobruk, on the African coast, about 250 miles east of the city of

Tripoli. It was declared that the Italian loss was twenty-seven officers and 3,500 men killed and wounded, against about 150 killed and wounded on the Turkish side, and that a great quantity of camp equipment was taken. Engagements were said to have occurred on March 11, 12 and 13. The European Powers are again trying to bring the Turco-Italian war to a conclusion. Apparently the Italians have made little headway of late, and dare not leave their fortified trenches. Fever is an enemy of the invaders, and the number of Arabs under the Turkish flag is constantly increased.—It is rumored that Italy plans to disembark troops on the Island of Lemnos, in the Ægean, a strategic point not far from the Dardanelles. During a period prior to 1487 the Venetians held this island. It has been occupied at different times by the Thracians, Armenians, Persians, Byzantine Romans and Genoese princes of Mitylene.—Italian officials at Luino, near Lake Como, have seized two French aeroplanes, bound for Turkey, on the ground that they are contraband of war. The machines have been sent to the military aviation camp at Rome.—A Turco-Russian dash over a tract of territory in Persia claimed by Turkey is regarded as more than remotely possible. Turkish troops have taken possession of some 10,000 square miles. It is suggested that an agreement to allow Turkey to take this territory as compensation for the loss of Tripoli may have been decided upon by the Triple Alliance.—The Persian reply to the Anglo-Russian note is highly satisfactory to those Powers. It accepts the proffered advance of \$1,000,000, for immediate expenses, at 7 per cent. interest. Persia agrees to dismiss all irregulars from the army as soon as the ex-Shah and Salar-el-Dowleh leave Persia, and to discuss with the legations the organization of a small effective army, and to pension the ex-Shah and to give an amnesty to his followers, on condition of his departure.—The government of Prime Minister Venizelos obtained a sweeping majority at the elections to the Greek Parliament on March 24. The election was orderly, but it followed an exciting campaign, in which many charges were made against the Premier.

A Pioneer Anti-Tuberculosis Experiment

BY MARCUS M. MARKS

[On the 25th of this month the inaugural exercises will be held of the Tuberculosis Preventorium for Children at Farmingdale, N. J. Governor Wilson of New Jersey and others will make addresses and a special train will take guests from this city to Farmingdale for the afternoon. Mr. Marks, who is one of the prime movers in establishing this new charity, has been for years one of New York's most public-spirited citizens, giving his time, name, and money freely to all good works. He is especially interested in industrial and international peace, and has been very active in the National Civic Federation and the New York Peace Society.—EDITOR.]

“CLOSE the windows, I’ll catch cold,” has always been the cry, when the thermometer was low. Tuberculous people, who slept with open windows, or in open camps on wintry nights with good results, were thought *immune from colds* on account of their very trouble. The cry, “Close the windows,” was not hushed by their satisfactory experiences. Lately, for the first time, groups of children who were *not* “actively” tuberculous, have been taken from city tenements, where they were in danger of infection from tuberculous parents, and were placed in open camps established in the country. They romped, they studied, they rested, they worked, and they slept out in the open, in winter as well as summer. The thermometer often ran down near zero—sometimes below—and there was no complaint, or ill result. On the contrary,

the children’s cheeks became rosy, their weight increased on the average from four to twenty pounds each during a three months’ stay, despite their active life, and they soon shook off their sensitiveness to infection.

Not a cold—no illness of any kind in the case of 365 children at the Tuberculosis Preventorium at Farmingdale, N. J., thus far! And uniform gain in weight and strength! Shouldn’t the cry of “close the windows” cease?

We have in New York many factories and shops that are called “sweat-shops.” Most of these have many windows that give little light and no air—why? They are always *closed* and usually dirty. Could we make it compulsory to open and clean these windows, by legislation if necessary? It would be a great point in the fight against tuberculosis.

To return to our story:

If we could *save the children*, the next generation would have no "white plague" problem.

It is difficult to cure. It is comparatively easy to prevent.

The Preventorium began a stormy existence in Lakewood in July, 1909. The residents strenuously objected to the presence of the institution on the ground that it would injure the prestige of Lakewood as a pleasure resort. The proposed gift by Mr. Nathan Straus of a half interest in the great Lakewood Hotel property was lost to the Preventorium by its removal. By the gift of 170 acres of beautiful farm and woodland by the estate of Albert Brisbane through Mr. Arthur Brisbane, and the subscription of \$50,000 by Mr. Straus, and \$50,000 by a "friend of Mrs. J. B. Harriman," the institution was enabled to transfer its work to Farmingdale, N. J., in the pine belt, seven miles this side of Lakewood. The model buildings and open camps designed by the architects, Scopes, Feustmann, and Judell, and now completed, cost \$150,000. An appeal for a third \$50,000, therefore, became necessary. The ladies of the auxiliary of the Board of Health Tuberculosis Clinics re-

sponded by subscribing \$6,500. A number of friends of the cause sent checks ranging from \$1 to \$2,500, and Mr. John D. Rockefeller and Mr. Andrew Carnegie subscribed \$10,000 each, and Mr. Jacob H. Schiff \$5,000, to be paid on the completion of the \$150,000.

There are four new open camps, each to contain thirty-two beds and two attendants. Each of these camps is divided into two equal parts by a comfortable dressing room. Underneath are showers and toilets. Above is a model open school room.

A large central administration building includes dining room, kitchen, and quarters for staff. A modern power and laundry equipment completes the institution.

The construction is of hollow tile and cement. The architectural lines are simple yet beautiful. The total investment will be \$150,000; the capacity, 172 children.

The purpose of the Preventorium is not only to save the 600 to 700 children that will come under its care during the year, but to help show the way to save the 40,000 children living with tuberculous parents in New York City today.

The composition of the board of di-

WEREN'T THESE BOYS WORTH SAVING?

rectors of the Preventorium is unique. There are thirty men and women, including physicians, lawyers, and laymen, Protestant, Catholic and Jew. No other private charitable institution has ever been organized on such liberal lines.

There is an auxiliary board of thirty in Farmingdale, N. J. The mayor of Farmingdale is president, and the two clergymen, the two physicians, and the leading storekeepers and farmers make up this local board. They have taken charge of the entertainment of the children, and have arranged trips to the seashore, celebration of festivals, and other plans to add to the happiness of the children.

Only poor children ever reach the Preventorium. There is no charge for fare, board, or clothing. Application for admission should be made at the Tuberculosis Clinic nearest the child's home. The Tuberculosis Clinics are scattered in thickly populated districts on both the east and west side of Manhattan, Brooklyn, and Bronx. The children are approved by the Department of Charities,

and are examined by the Hospital Admission Bureau, 426 First avenue. They are taken by nurses to the Preventorium, at Farmingdale, N. J. Here they remain three or four months in open camps under careful observation. No child is returned until the home conditions have been made safe thru the removal of the tuberculous parent, or thru education of that parent as to disinfection, burning of sputum, the necessity of open windows and clean floors. The purpose is to avoid "working in a circle." The children are followed up by a special Board of Health nurse for years after their discharge from the Preventorium.

The Board of Estimate and Apportionment, of New York City, has recognized the economic and humanitarian value of this preventive work; they appreciate the fact that every child thus saved lifts a burden from the city for years to come. Instead of becoming a breeder of further infection, and thus a curse to the world, the child obtains a fair chance to live a happy life.

THE SLEEPING QUARTERS AT THE PREVENTORIUM

THE CHILDREN ARE ALWAYS IN THE OPEN

Dr. Abraham Jacobi, the dean of the medical profession, says:

"Our big cities in a few years to come will be conducting tuberculosis preventoriums for the same reason they are now conducting pure milk stations. To keep people from having tuberculosis instead of making belated attempts to cure them after they have contracted the disease is not only much more humane; it is much more economical. The pretuberculous children, if taken away from their infected homes in time, don't become expensive public charges on the city or State."

Dr. Hermann M. Biggs, general medical officer of the health department of this city, says:

"If the children are sent to the sanatoria with their parents they will surely develop tuberculosis. There is no place among all our philanthropic organizations for them. The Preventorium, thus, is an indispensable link in the problem of poverty. It is there that the children of tuberculous parents are sent. The children are kept there three or four months. They sleep out of doors, get the best of food, and gain from ten per cent. to fifteen per cent. of their body weight. They come back to the city in fine physical condition, to a home which has been cleaned up and made sanitary by the Board of Health."

Dr. James Alexander Miller, president of the Association of Tuberculosis Clinics, says:

"If tuberculosis is to be stamped out it will

not be because sanatoria or other institutions are able to cure all cases, but because gradually the sources of infection are being eliminated and the general resisting power of the individual members of every community increased.

"It is in this latter direction that the Preventorium fills a most important need, by building up children, who otherwise might become consumptives, in such a way that they can successfully resist infection."

Dr. Alfred F. Hess, expert in children's diseases, says:

"The Preventorium shows that children if properly clothed can thrive in fresh air at any time of the year, and I believe the time is not far distant when we shall have not only the tuberculous treated in the open air as is at present the case, but that the well children in asylums, foundling institutions and similar places, where a large body of children are aggregated, will be allowed to have the pure, fresh air for twenty-four hours in the day. This seems to me to be the only hope of preventing and limiting widespread infections in these institutions."

All specialists and experts in the movement to prevent the spread of tuberculosis agree that the Preventorium plan is sound, economic, and most hopeful. Will not our enlightened community encourage, support, and help develop this important pioneer work?

NEW YORK CITY.

The Bahai Movement

BY LOUIS G. GREGORY

[Abdul Baha, the distinguished Persian who leads the Bahai movement, will arrive in New York City this spring for a tour of America. He has recently visited in Europe, where he addressed many people on the subject of universal peace thru the unity of religions. The Bahai movement is attracting a larger and larger share of public interest and attention, as is deserving of a movement which in sixty-seven years has manifested enough power to unite Jews, Christians and Mohammedans to the extent of several millions.

—EDITOR.]

THE Bahai movement began in the Orient more than half a century ago, and has made rapid headway. And now it has gained a firm foothold in Europe and America. Altho its propaganda is very quiet and entirely without sensational features, there is scarcely a large city of America today which does not contain an active Bahai assembly. Among its adherents it numbers people of many classes and races, and in its aim and scope attempts the unity of all races and all religions. Its work has brought to pass the curious spectacle of Jews, Christians, Mohammedans, Hindus, etc., finding a common platform upon which they may unite to worship God and regard each other as men and brothers. It has broken down many of the traditional prejudices among the people of the Orient and its progress in the western world is watched with interest by many people. The following is a brief historical sketch of the three men who have successively led this movement toward the religious emancipation of the world.

Persia, "the land of the nightingale and the rose," in ancient times the seat

of learning and power, ruled over by Cyrus the Great and Darius, but in modern times sunk into weakness and poverty, was the scene of the origin of the religion of Bahai.

On May 4, 1844, there suddenly arose a young man, Ali Mohammed by name,

who followed the occupation of merchant and declared himself to be a religious leader. Living in a Mohammedan country and making such a claim without being connected with one of the religious orders was not without its perils, for the Moslems are very fanatical. A fact which further served to increase the danger of Ali Mohammed was the claim which he put forth of being the Imam Mahdi. It was apparent that such a claim could not be an ordinary one. In truth, so quixotic did it at first appear, from a Mos-

lem viewpoint that it was met with jeers and laughter on the part of mullahs and people.

For their holy book, the Koran, does indeed tell how in the latter days the Imam Mahdi will appear, with Christ, to establish peace and universal brotherhood on earth. But according to the theology of Islam such a thing could

ABBAS EFFENDI

The Bahai leader is also known as Abdul Baha

only be connected with extraordinary phenomena, apparent to all people.

But upon this inspired young man ridicule had no deterrent effect.

It was evident to a few that he not only took himself seriously, but that his extraordinary beauty of person, exemplary character, logical reasoning and inspiring eloquence were entitled to some consideration. He not only taught his strange doctrine in his native city of Tabriz, but journeyed from city to city, enduring many privations, but making converts so rapidly that the clergy became alarmed. He was arrested and taken before a learned council of mullahs, questioned closely and criticised, and soundly beaten, the Sheik ul-Islam administering the rods with his own hands. But falling into disgrace had just the opposite effect upon his followers from that which the mullahs imagined. His friends increased in numbers so rapidly that stern measures of repression were resorted to. They were robbed of their estates and put to death, oftentimes in the most brutal manner. It is estimated that the number of martyrs was not less than twenty thousand. Among the most famous of these martyrs was a beautiful woman, a poetess by the name of Kurrat ul-Aine (Consolation of the Eyes). She saw in the movement of the Bab, as the leader called himself, an expression which in Persian means the door or gate, the emancipation of her sex in the Orient. She taught his doctrines openly, even daring on one occasion to discard her veil, a mortal affront to the religious fanatics about her. But her logical reasoning and impassioned eloquence aroused many souls, and as the time of her condemnation drew nigh she awaited her doom with the utmost resignation, rejoicing that she was surrendering her life in the Path of God.

After causing a stir which shook the ancient kingdom from the Gulf to the confines of India and Turkestan, the Bab was himself martyred in the year 1850, after six years of teaching. But the death of the leader did not abate the persecution of his followers. The Bahis continued to be treated with great cruelty.

Before the passing of the Bab he had

warned his followers to prepare their hearts for the coming of One Mightier, who might appear at any time, and manifest to them the Glory of God upon earth. This prophecy was to them fulfilled in the coming of Baha'o'llah (The Glory of God), who arose before the passing of the Bab and supported his declaration. This adherence to the cause drew upon his head the wrath of the Government. A man of illustrious family and vast estates, he was reduced to poverty and cast into prison. For some time his life was threatened, but thru the intercession of the Russian Ambassador and other persons of note, his punishment was commuted to exile. With his family and a few followers he was sent to Bagdad in Turkey. Here he passed about two years, when he suddenly left his family and friends and retired into the mountains, remaining in close communion with God. Upon his return to Bagdad he revealed the Book of Ighan, wherein many mysteries as found in all the holy books of religion are interpreted. Soon after this he made the declaration of his station to his eldest son, Abbas Effendi, and a few other followers, claiming that he was the Greatest Manifestation of God, whose coming the Bab foretold. He was carried as a prisoner to Constantinople, thence to Adrianople, and finally confined at Akka or Acre, in Palestine, "the Most Great Prison" of Bahai literature. He revealed many wonderful writings and from his lowly prison sent messages to the rulers of the world, calling upon them to join in the movement toward universal peace. Perhaps the essence of his teachings is expressed in a statement made by him to Prof. Edward G. Brown, of Cambridge University, England, upon his visit to the illustrious prisoner:

"We desire but the good of the world and the happiness of the nations. Yet they deem us a stirrer up of strife, worthy of bonds and banishment. . . . That all nations should become one in faith and all men as brothers; That the bonds of unity between the sons of men should be strengthened; That diversity of religion should cease and differences of race be annulled. . . . What harm is there in this? Yet so it shall be. These fruitless strifes, these ruinous wars, shall pass away and the most great peace shall come. . . . Is not this that which Christ foretold? Do

not you in Europe desire this? Yet do we see your kings and rulers lavishing their treasures more freely on means for the destruction of the human race than on that which would conduce to the happiness of mankind. These strifes and this bloodshed and discord must cease, and all men become as one kindred and one family. Let not a man glory in this, that he loves his country, let him glory rather in this, that he loves his kind."

Baha'o'llah passed away in 1892. In two of his writings he commanded his followers to turn to his eldest son, Abbas Effendi, "The Greatest Branch," as their leader. For many years he was a prisoner with his father. But during the revolution of the Young Turks he was set free, after having been condemned by Abdul Hamid to perpetual imprisonment. He bears the spiritual title of Abdul Baha, which means the Servant of God. His personality is most attractive. Even when a prisoner his fame spread abroad and attracted visitors from Europe and America. His life is given to good deeds, giving hope and

cheer to the suffering and aiding humanity in every way. Among the most learned of men he is as much at home as among the poor and humble. This is very remarkable, as he has never attended school and studied books after the manner of men. Last spring the writer met him at Ramleh, a suburb of Alexandria, in Egypt, and found him as much conversant with conditions in America, such as the race problem, as one who had lived here all his life. His messages of peace and good will have been received in England, France, Switzerland, etc., in which countries he has journeyed. And he is due to arrive in America early in the spring of this year. He has already accepted some invitations to speak in churches and address peace societies and other gatherings. So that during his visit Americans will see one who steadily grows in popular favor and is even now regarded by some millions of people as the foremost man of the world.

WASHINGTON, D. C.

The Passing of the Manchu Dynasty

BY GILBERT REID

[The Rev. Dr. Gilbert Reid is an experienced American missionary who had the large vision of China Christianized, and to that end became an independent worker among the higher classes, mandarins and scholars, who would be followed by masses of the people. He wrote books, pushed education, illustrated by ethics and commerce a higher civilization, and made himself familiar with the Manchu official class in Peking. This article is of unusual value for this experience of his.—EDITOR.]

WHENEVER a person passes away to the great Beyond, whether friend, relative, rival or foe, and whatever the defects or the virtues that stain or glorify, a mantle of charity is thrown over the past, and we mourn for the departed and grieve with the afflicted. Would it not be seemly to act in like manner as we consider the passing of one of China's many dynasties, the end of the Manchu House, on February 12, 1912? To think of all that is good during this rule of two hundred and sixty-eight years will do us no harm as we face the future. Respectful appreciation of a part of our fellow men in their days of power will expand our sentiments of regard for all mankind,

and help to unite the nations in the fellowship of a universal federation.

Dr. Wells Williams, some sixty years ago, exprest his calm judgment thus:

"There is little doubt that this enormous population has been better governed by the Manchus than under the princes of the Ming dynasty; there has been more vigor in the administration of government and less palace favoritism and intrigue in the appointment of officers; more security of life and property from the exactions of local authorities, bands of robbers, or processes of law; in a word, the Manchu sway has well developed the industry and resources of the country, of which the population, loyalty, and content of the people are the best evidences."

Distinguished and long were the reigns of the Emperors Kanghi, Yung-cheng and Kien-lung, who laid well the

foundations of a vast empire. Tho belonging to an alien race, they absorbed with marvelous sagacity the best of Chinese ideas, while retaining the strength of their Northern characteristics. They adopted the laws, ceremonies, doctrines and usages of the people who had been conquered. In conquest of others they allowed themselves to be conquered in turn. The most learned men were summoned to the capital to write commentaries on the Confucian classics, to codify the laws and to edit the greatest dictionary of Chinese history. More Manchus learned the Chinese language than there were Chinese to learn Manchu. More Chinese than Manchus held office. Justice marked the course of expansion. The eunuch system was abolished. Enlightenment, art and integrity flourished.

The attitude at the outset to outside peoples was tolerant. Those who came as friends were welcomed. Christian churches were erected in the capital and the provinces. An imperial tablet was hung in the Peking cathedral. Scholarly missionaries were appointed to office. Trade with the West was encouraged. If justice and friendliness had characterized the foreign attitude, the "open door" would never have been closed.

The empire grew strong. The people were so prosperous as to be sufficient in their own resources. A system of government, based on the principles of the sages and recognizing learning, became the admiration of students in the West and the glory of China. While Europe and America were scenes of conflict, upheaval and aspiration, China was the home of contentment.

At last the time of testing came, and the Great Pure Dynasty stood the test. Without was war with Great Britain and France; within was widespread rebellion. Loyal men arose in the provinces—Peng Yn-lin, Tso Tsung-tang, Tseng Kwo-fan, Tseng Kwo-chuen, Li Hung-chang, Ting Pao-chen and Seng Wang, while in the capital arose the Empress Dowager, Prince Kung, Wen-siang and Kwei-liang, and by the help of judicious representatives of the Powers, brought back an era of peace. Treaty ports multiplied thru the years; mission-

aries under imperial edict resided in all the provinces and prosecuted their work with growing favor; trade, internal and external, steadily increased. The young Emperor espoused the cause of reform. There was a whirl of expectation.

Again came a time of testing. The Boxer incantations, mingled with hatred of foreigners and resentment of aggressions, captured the court and deceived multitudes. But in the provinces were Chang Chih-tung, Lin Kw'n-yi, Li Hung-chang, Yuan Shih-kai, Tao Mu and Tuan Fang, while in Peking were Gung Luh, Hsu Yung-i, Hsu Ching-cheng, Yuan Chang, Li Shan and Prince Ching, all of whom, thru the magnanimity of foreign Powers, rescued the ship of state and once again sailed her out into a quiet sea.

The lesson was well learned. The court and exclusive nobility were attracted to intercourse with the legations. Sociability became stylish. Reform in dead earnest advocated by Chang Chih-tung and Yuan Shih-kai, and espoused by the Empress Dowager, became the creed of the nation. Old ideas and old methods were abandoned. Every one was learning. Constitutional government, all the way from local self-governing assemblies to a national parliament, with a limited and safe franchise united with a system of Western education, received the sanction of the Throne and became the hope of the people. China under the Manchu House was at last awake.

Then came the end. High Heaven, by inscrutable decree, summoned the Manchu dynasty to yield up its power to the will of the people, to issue its last edict, and to pass on in the stream of history, with its records of the past to be studied by men and judged by God.

Those who mourn in the homes of the Manchus may be appalled by the sight, but other than doom awaits them as individual members of the new commonwealth; they are called to be grateful for conspicuous magnanimity in the closing days of the Manchu House, and to look forward with hope to an equitable participation in the problems and international relations of the New China.

We

BY LOUISE DUNHAM GOLDSBERRY

[Our readers will not have forgotten Mrs. Goldsberry's pretty story, "We," in our issue of December 21. This, tho complete in itself, is "Part II."—EDITOR.]

WE gave the time-honored final spread. The spread is a thing forbid.

Hence.

It begins just as town clocks begin to tell the midnight over all the town. One-two-three—soft; low; big; reverberant; assonances against the black sky; and far, far off, always ending last, like a crystal fringe about all the thick trembles of sound and the ebbing pools of sound, the chimes. I always feel as if I were going down a garden of spices and star-lost fragrances when that midnight sursurge overtakes me and there is nothing in all the world but it and me.

And I forgot to *unlock* the door!

I *müste* to listen. To unravel every thread as if I were a bobbin for them to wind up around.

And I *forgot* the door!

And a peremptory kick on the door—I flew to open—ten ghosts tumbled in—and We *bare-l-y* shut out another ghost who pursued!

"Open the door, young ladies."

It was our floor teacher!

Not a breath!

"This will *be reported* to President Moore," came like pebbles thru the key-hole.

"Dread-ful bad for her health," said Laura, in a very sorrowful voice. "Late hours—temper—reports."

"Well," said Patty, beatifically, "I ought to *beat* Peggy; but when I'm sinning I like to be a real black-and-blue sinner! *Now*, We can eat up everything and stay out all night and tell murder stories and ghost stories. I

know twelve banshee stories and every *s-i-n-g-l-e* one is true.

Hence.

Said our adored president after chapel next morning:

"The junior class will remain."

We remained.

Also the floor teacher.

He looked at her.

She was homely.

Quite so.

She taught us chemistry and mathematics. And she looked like it, too.

She had been what Lil called the "Pillar of Salt" in our path from freshman days, and before; for We knew she was ahead.

And he looked at us.

He opened his mouth.

"*Girls*," he said, "*was it good?*"

"Go to class," he said. "Don't do it again," he said.

And We waltzed solitaire all the way to class.

For this was our last junior prank. And when next We should assemble it would be as the always-good seniors.

Already We felt something of the bequeathed hauteur of the departing seniors, and realized *for* the first time how perfectly that haughty air appertained to seniors; and, too, with what gracious yet simple dignity We should wear it.

Kate Nash called back to us as the seniors-no-more trooped from the stage laden with commencement plunder:

"Little girls, little girls, good-bye."

And Patty chanted back:

"Alumnae babes, be good, be good."

What would next year be without that splendid line ahead? *What* if they *did*

appear to own the college? *What* if even to own the whole earth? "*Now on to Cheyenne,*" said Kate Nash. What, even, *what* if WE did have to dodge trains down corridors and were required to refrain from stepping on them? The dears *knew* we were simply consumed with envy!

The rain was raining. Just a stilly, *dreeing* kind of rain. Our seniors were leaving in a body for the station. Patty had gathered us into a dark alcove just over the main entrance. As the seniors (there were twenty-four) began going slowly down the steps into the lamp-light spattered night to the carriages, We began to sing, Patty's voice lifting high and pure and unbroken out into the dark above them. They stopt. Every wheel and foot passing by stopt. All our voices choked in tears. Except Patty's:

"*Keep love's banner floating o'er you,*" her voice dripped sweetness over them. And again We joined:

"*Till We m-e-e-t, till We m-e-e-t,
Till We meet at J-e-s-u-s' feet.*"

And then the last carriage had gone 'round the corner. But Patty's angel voice to the night and the still rain sang on alone:

"*G-o-d be with you till We meet again.*"

And then We went away to hunt for a wailing place.

For never again would darling Mary Ninde go down the corridor to ask some little day pupil if she had on her rubbers. And never again would Amy Sutherland's sweet-lidded eyes laugh at us.

And Patty sobbed: "Who w-w-wanted to g-grow up-p, anyho-o-w?"

"Well," I said, "I *always* intended to grow up purposely to marry our adored president—I mean, when he was our pastor. I *suppose* that's what started me and I couldn't stop."

And We refused to be comforted.

Patty went over to Ireland that summer. She *said*, "To hunt for the rest of the teaspoons."

And the balance of us to our admiring parents.

I read a list of books. Practised. And spent most of the time with my beautiful mother.

I do not know why. But I could not

bear to be out of her sight. Sometimes I would seem to hear her calling me—just the *feel* of my name, and she'd laugh and say, "You heard me thinking." And sometimes I'd find her watching me with gaze unbearably sweet, and once with tears; but she said, "The sun is in my eyes, Peggy."

And she seldom went away from the house. And in her white summer gowns she looked the incarnate white thought of a woman.

I did not want to go back to school.

But she sent me.

And after I got into the carriage I made father let me out again, and I went back and laid my head in her lap and kissed her hands and the sweet throat of her and said, "Mother, mother, I love you so!"

And she held my hands to her lips and said, "*Mother knows.*"

We all had a new and difficult-to-handle hauteur when We met. And each of us was amazed that every one of the thirteen had *e-x-a-c-t-l-y* the air each secretly hoped she alone would have acquired.

We maintained it about two weeks or thereabouts.

But We found analytical geometry the MOST UTTERLY HUMBLING thing *any one* could have conceived in most horrid dreams!

Nor was political economy wildly exhilarating.

And We longed backward for the junior days when We and Dana went *trilobiting* and *ichthyosauring* together and putting labels on all the things in God's tired little world.

Like the Hebrew people for the flesh pots.

Almost all my home letters were from father.

I wondered if father were practising for a writer.

I wrote every week to mother.

And then I'd send postscript next mail, just to tell her I loved her.

About a month before graduation my beautiful mother wrote:

"Peggy, my own little baby-girl, that mother carried under her heart, remember how as a tiny child you used to dare yourself into being brave? 'Don't you dare to ky, Peddy,' you'd say; 'don't

you dare to ky, Peddy.' You were so intensely proud of the old soldier blood in your veins. Darling, be too proud to turn coward now, when mother needs your bravest courage. Needs, little daughter—for mother is the coward at thought of the door closing between you and her. But it's just a 'closed door,' my baby—not a sealed one—and try to think, as last summer here at home, 'mother's gone in to rest awhile.' Now this is your share—my dearest wish has ever been to know you equipped, lovely, graciously, for life—I want you to take your college degree. But one more month, then you come to me with your shield. With your shield, Peggy; with your shield—because mother asks it—and mother expects it. The blood of your pride never turned traitor on the firing line. Mother will not write again, and desires you not to write save to father. But, O my baby, my one little only baby, you still lie under your mother's heart."

In midnight I wakened in arms I knew could only be Patty's; close-held, as sometimes, last summer, I'd waken and find my beautiful mother holding me.

"I know, precious," kissed Patty's lips; "I read it."

And in Patty's arms I wept and prayed and prayed and wept and asked God to make my beautiful mother understand I'd come to her *with my shield*.

And the girls who had no mothers would hold me close in anguish of understanding and say never a word.

And the girls who had mothers would try to stammer scared sympathy.

But they did not understand.

Patty said, "Darling, if you cry, you can't study, and tomorrow's lessons are simply hideously awful."

"I know. The shield."

And the days went.

But I understood, now, what she meant when she said last summer, "The sun is in my eyes, Peggy."

And graduation came.

It came from home: the dress. The graduation gown that had been hers. And hers, too, the bridal fan. And the bridal slippers—too tiny for me, and Patty set gussets into the toes of them.

And lily of the valley—her own flower—enough for a queen's crowning.

And they put a great silken coat about me and took me home. Our president and Patty. And they lifted her, that she might see—crown, lilies, her poor girl, and all. And her arms opened to me, and they put me into them.

And they went out and left us alone together.

Bare one week after I came back to her, the closed door opened—in her bridal gown they robed her. And into the dark of the flowers, where she slept in the night, I went to her and whispered to her all the letters she had not let me write; all the broken vase of my love I told her—

And O—my beautiful mother—my beautiful mother—

WASHINGTON, D. C.

A Birthday Posy

BY ARCHIBALD MAC MECHAN

For one more year of love and love's increase
Let us lift up our hearts, and for the peace
Brought home by one more head within the nest,
The small, black head between your arm and breast.

Your face is three times fairer than the day
When you went shining on your sunshine way
And dazzled a boy's eyes, for wearing now
The mother's threefold crown on that white brow.

HALIFAX, N. S.

What Is the Matter with Our Army?

VI. The National Failure to Realize Its Purpose

BY BRIG.-GEN. ROBERT K. EVANS

[This is the sixth article in our Army series. Preceding articles have been contributed by Major-General Wood, Brigadier-General Wotherspoon, Brigadier-General Edwards, Lieutenant-Colonel Leggett and Major George W. Shelton. The author of this article is Chief of Division of Militia Affairs.—EDITOR.]

FIGHTING must be recognized as the ultimate purpose of an army. It is an unpleasant idea, but nothing is to be gained by disguising it. On the contrary, much is to be lost. And herein lies a fundamental trouble of ours in a military way. If we have not attempted to disguise this final purpose of our army, we have at least never recognized it in a practical manner. We have almost wholly neglected its development as a fighting weapon, and have been content with shaping it to meet ordinary emergencies as they arise. Undoubtedly armies serve many useful purposes both in peace and war, but there is none for which they may properly be used that is not dependent upon the qualities that fit them for their ultimate purpose. It follows, therefore, that every other purpose will be the better served when an army is developed solely with its ultimate purpose in view.

For this ultimate purpose of fighting, an army may be used in two different ways—defensively and offensively. Most of us have difficulty in conceiving employment of our army in this latter sense. It sounds too militant. It seems opposed to the American principle of non-interference. The use of our army offensively abroad seems for the moment so improbable as to be unworthy of consideration. Yet this is the only way we have used any considerable part of it actively in a military sense for nearly a quarter of a century. We have used it thus in Cuba—twice—and in the Philippines, and we have concentrated part of it very recently thru fear of necessity for its use in the same way elsewhere. Necessity for similar use may arise at any time.

Under our present system we do not maintain a regular mobile army sufficiently strong to meet even these de-

mands; much less, then, do we maintain a mobile army sufficient to meet the *defensive* needs of the nation. Therefore, to supplement the regular army we must needs rely, first, upon the organized militia, and thereafter upon such volunteers as may be necessary for the purpose in hand and that can be raised, equipped, and put into the field without delay.

In attempting to understand the primary troubles with the army, we must keep these things in mind. The regular mobile army must be in readiness to be used either at home or abroad, and either alone or in combination with the organized militia, or in combination with newly raised volunteers, or in a combination that shall include all three of these forces. It must serve as a model for the organization, training, and equipment of the organized militia, and as a model to be followed in the event of a call for volunteers. Under the present conditions and with the existing system our mobile army is prepared in no way for any of these purposes. It cannot be used efficiently by itself as a defensive force in time of invasion. It cannot be mobilized by itself in anything like its actual strength for use as an expeditionary force abroad. It has no organization of its own as an army and so can serve in no way as a model for the organization of the militia. As a consequence we find every deficiency of organization, training and equipment of the regular army duplicated and emphasized in the National Guard. The same deficiencies would be multiplied indefinitely in any volunteer force we should attempt to raise. Without organization as armies, any relation between these forces admitting effective combination in time of emergency is impossible.

Our dependence upon these additional forces to supplement the regular army is

fixt by a national attitude that it would be hopeless to expect to change. We are bound to make the best of whatever we have in the way of military forces. From the very limitations placed by law and custom upon the strength of the two forces, the regular establishment and the organized militia, in actual existence, we must build them, if they are to be militarily useful, upon an expansive principle. The strength of the regular establishment is fixed by law, the strength of the National Guard by local conditions and the limitations imposed by forty-eight different States. Neither the one force nor the other in time of peace reaches its authorized strength. In time of war, then, we must be able at least to fill them to their full strength promptly, and to fill them with men at least partly trained, if we are to avoid reducing instead of increasing their efficiency at the moment when their efficiency should be at the highest. In any important emergency these forces combined cannot be sufficient. We must rely, then, upon the creation of a volunteer army to afford whatever additional force is necessary. To fill the two organized forces to their authorized strength in time of emergency we must have some system of reserves, that is, some system whereby men who have already served in one force or the other and have had the advantages of some military training can be recalled to the service for the period of active necessity. To assure the maintenance of these organized forces at their proper strength while the emergency continues, and to assure the raising of the necessary volunteer forces, we must have on our statute books a law to enforce military service in time of war. Our three primary military needs, then, today are, first, organization; second, a system of reserves; and third, a general recruiting law.

Congress, by the Constitution, is given the power to raise and support armies. It is an essential power of government so long as war remains even a remote possibility in international affairs. It should be a matter of surprise therefore that Congress, having possessed this power since the institution of our Government and having seen our governmental powers strained to the breaking

point in both international and civil war, should never as yet have enacted a law permanently insuring its right to call, if need be, every able-bodied citizen to the defense of the nation. The draft act of 1863 comes the nearest to anything of the kind on the statute books. It is doubtful if that act be still in force. It is to be hoped that it is not in force. It was an unsatisfactory act, as any such act passed under the strain of a war demanding its enactment must always be. But there should be some act written in the calmness and security of peace, providing adequately to meet the governmental needs in war. Its mere suggestion may seem startling now. To suggest a law requiring military service of our citizens, even in time of sore need, seems opposed not merely to the spirit of our institutions, but to the voluntary service, upon which presumably we depend for our defense; but, on the contrary, it is the spirit of our institutions, itself—equal rights and equal obligations for all; while it should only usefully supplement voluntary service or supplant it when its failure is self-evident. Moreover, the National Government is not lacking in examples already set by the State governments. Thirty-four of the States comprising the Union have already written into their laws terms no less drastic. Thirty-four States can now by the law that governs them summon their citizens to serve in the militia if need be and enforce the summons thru the courts. But the National Government cannot, of course, demand enforcement of these laws on the part of the States, even in the emergency of war. They remain State rights, to be operative or not at the pleasure of the States themselves. But with this example set by an overwhelming majority of the States of the Union, there can be no reason why the Government of the Union should not exercise the right granted by the Constitution and the first law of nature, as well as of national life. It would mean no hardship or military restriction of any kind in time of peace. It would be the least of all possible evils in time of war. It would not mean militarism; it is democracy in the ultimate.

Moreover, it would not be so difficult a thing in execution as may generally

be anticipated. A recruiting law dividing the United States into districts coinciding with the judicial districts of the country and authorizing United States marshals, when in time of war voluntary enlistments fail, to empanel recruits in the same manner as they now empanel men for jury duty, would meet in full the necessities of the case. The United States has been forced in the past to resort to conscription, and it may have to resort to the same unlovely thing again. A system evolved in peace would enable us to avoid in war all of the worst evils of conscription. To wait for war to evolve the system means that all of the worst evils will operate at once against efficiency in the military service and against loyalty in the nation at large. It has always been so. It will always be so.

A general recruiting law of this character would insure supply of recruits for whatever forces we may have in time of war. We cannot expect to carry on war without losses, and we cannot expect properly to replace these losses without a workable recruiting law. But this is not sufficient. We must be able to put into the field at once in an efficient state whatever military forces are maintained in time of peace. In other words, we must have reserves of trained men sufficient to fill these forces to their war strength and sufficient in addition to replace with trained men the losses that may immediately occur before our volunteer armies are organized and equipped. A reserve system for this country has been condemned as un-American and impossible. It is neither. It is no more un-American than are armies themselves. It is no more impossible than is the creation of any military force whatsoever. It is merely new to our habit of thought. With proper organization and distribution of the army it would probably prove the easiest in execution of anything we have attempted in a military way. And certainly it would afford chance for efficiency in time of need that is now under the system followed absolutely precluded.

To understand this we have only to consider what has happened within the recent past and what must certainly happen always hereafter unless our system

be changed. The organizations of the forces now in existence are at less than half of their full strength. At the outbreak of war only two courses are possible. We may send them as they are to the front, in which case they would soon be so reduced in number by casualties as to be wholly ineffective and unimportant. Or we may complete their strength by adding undisciplined and untrained men drawn from the first rush of volunteers and send them thus to the front, at perhaps their full strength, but with their efficiency seriously reduced if not altogether ruined for the time being by this influx of raw recruits. Either course would leave us, at the time for which presumably we are preparing our military forces, in a condition of practically complete military inefficiency. Without a reserve of trained men this result can be avoided even in part only by keeping organizations at their full strength at all times. This is a costly method and, in the case of the organized militia, at least, would probably prove impossible.

Reserves are the only alternative. Reserves, moreover, are not a novelty in military life. On the contrary, they are a part of every important military system of the world, and have been an increasingly important part of most systems ever since their first institution in the Prussian army after the Napoleonic wars. The principle of reserves may best be understood by brief illustration of its application to our own system. We enlist the soldier now for a three-year term, upon the conclusion of which he may re-enlist for a similar term, and so on until he has served thirty years, or may take his discharge and go his own way without obligation thereafter to the Government. It has been recently legislatively suggested that this period of enlistment be increased to five years as a matter of economy. The economy is not evident to the military student, if this additional period is to be served in active military employment, while the increase of the period with the colors in this way is wholly opposed to modern military principles. Its tendency is toward the "professional" army instead of toward the "people's" army, toward military aristocracy instead of national democ-

racy. But if a part of this longer term were required to be served with the colors and the remainder on furlough in the reserves we should work both for economy and in line with modern military thought. Moreover, we should work for efficiency. While in the reserves no military duty would be required of the soldier unless called to the colors in time of emergency by the President. No restrictions would be imposed upon his employment or residence. He would be socially and economically a part of the civil life of the republic. All that would be essential is that the War Department should be kept informed of his address. Very small pay, say \$20 annually, to be paid quarterly, would doubtless be sufficient to insure compliance with this single requirement. The return to the Government in assurance of military efficiency would far more than repay this cost. In the case of the organized militia even fewer problems are presented. The militia is "localized." It is, except when on active service, always in the same locality. It draws its personnel from this same neighborhood, and those passing to the reserves would remain generally in the same place. The institution of a reserve system for the militia, indeed, would probably in many ways be easier now than the institution of a similar system for the regular army, but mainly merely from the fact that the organizations of the regular army are not localized, that they have no permanent abiding place, that they draw their personnel from the country at large, and move from one part to another at not infrequent intervals. But the institution of such a system would probably lead to the localization of the troops of the regular establishment, a thing having comparatively few objections in a military way and much to be desired for many other reasons, military and economic, as well as to simplify the problem of reserves.

We can readily imagine a call for an expeditionary force where, like the second intervention in Cuba, the regular mobile force, or even a part of it, may be

sufficient for the purpose. But also it takes very little stretch of fancy to picture conditions arising in the near future that might demand the mobilization of a much larger force for the purposes of "pacification"—the kindest term yet used to represent what we must still call technically the use of troops "offensively." Again, on the defensive, it is altogether likely that in case of threatened invasion the regular forces would have to be rushed to the threatened point in order if possible to prevent our enemy's obtaining an unobstructed foothold while the organized militia is being mobilized. Later these two forces would have to be combined to offer such resistance as possible until our volunteer forces could be recruited and equipped. In the end all three would probably have to be combined for the prosecution of the war. This condition demands that the regular mobile force be organized as an army, regardless of its strength, and that so far as possible the organization of the militia as well as the plans for organization of volunteers conform strictly therewith. Organization in this sense means merely the division of each force into military units of uniform strength and composition, each such unit being itself a complete army on a small scale. We have no such units in any part of our military forces, regular or militia, at present. Without them we can unite these forces neither singly nor together into anything that represents an army in a military sense. The smallest unit of this kind known to the military world is the "infantry division." The smallest unit known is the largest unit we need, but without this unit definitely prescribed in its strength, composition, and proportion of different arms, organization in a military way is impossible. Unorganized military forces are but the raw material of armies. The raw material has satisfied our needs in peace, but only with the finished product can we hope to meet the demands of modern war.

The trouble with the army is our total forgetfulness of its true purpose.

WASHINGTON, D. C.

Exploration: Its Conditions and Rewards

BY HERBERT L. BRIDGMAN

[Mr. Bridgman, of the Brooklyn *Standard Union*, has long made a specialty of exploration. He commanded the Peary auxiliary expeditions in 1899 and 1901. He is a member of most of the geographical societies. His article is very timely now that Amundsen has just reported his discovery of the South Pole and the Japanese and English expeditions have at last been heard from, the latter only last week.—EDITOR.]

OF old, and particularly since the darkness of the Middle Ages, which made the rediscovery of the world necessary, exploration and discovery have been honorable and praiseworthy avocations, commanding rewards and distinctions, and honorable fame for the future. Columbus, Magellan, Cabot, Gama and the brilliant company of navigators who brought the world under the flags and sway of their sovereigns, founded an order of nobility of which the roll to those of our own day is long and illustrious. But within very recent years exploration seems to have fallen upon evil times, and instead of a mark of distinction, one of large and incredulous inquiry seems to follow. Some little of this change of attitude, this reversal of esteem, may be and probably is due to the change of conditions. *Terra incognita* is no longer an appreciable and important part of the earth's surface; at least, we are eager to believe that it is not, and the telegraph and printing press rapidly make common property in all civilized tongues of the achievements in any portion of the globe. The explorers themselves go from one center and one country to another, becoming actual citizens of the world, and so measurably satisfying the universal curiosity of mankind in personality and the impulse for hero worship. But with these allowances, and they are not important, the change in the popular temper and judgment, and to a certain extent in the scientific mind, toward exploration, is radical, almost complete; a new adjustment of values and standards has been effected, and it is necessary for those who are interested in the situation to attempt its estimate and interpretation. For it is a grave error to believe that the exploration of the globe is complete or anywhere near it. Trails have been cut, skirmish lines,

as it were, thrown out, and all over the sphere are abundant opportunities for the patient and competent explorer for many years to come. Exploration, too, is a constantly broadening and more inclusive term. Science assimilates all things, no matter how diverse, and the explorer who specializes in one, two or a few departments leaves much for those who follow. Exactness and detail are continually carried farther and farther, so that the crude and general statements of a generation, or even a decade ago, will no longer serve, or be accepted as real accessions to knowledge. Each new group or chain of facts becomes the base for further advance, and the limit of the inclusive exploration of the future is not, and never may be, within human vision.

The conditions of the new school of exploration, to which events are rapidly impelling us, are not, of course, finally established. Some of its fundamentals are, however, clearly visible, and recent experience makes them certain beyond a peradventure. The day of individual exploration, as a pastime, an adventure, or as a speculation, is over. The economic law which has resulted in combination is reflected in other fields of effort, and exploration can be planned, handled and controlled by organizations equipt for administration and control far more effectively than in any other manner. Each phase of the expedition as it proceeds from inception thru execution to final accomplishment, and the publication and distribution of its results, illustrates and demonstrates the value of organized responsibility and control. The business of the world nowadays is done on credit, and in scientific matters the same principle applies. When a new enterprise comes into the field, the first question among intelligent men is not, what is it? but

who is behind it? and so in the new school of exploration the sanction and guarantee, the hallmark and underwriting of an organization of acknowledged rank, resources and influence will be indispensable. This means many things, among which are first and most obvious, that the project will be carefully planned, thoroly studied to avoid duplication, repetition, rivalry or infringement; that all financial complications or difficulties will be forestalled; that the discipline and morale of the expedition will be maintained; and, more important perhaps than all, that the work will be co-ordinated and correlated with all other work of every sort in that particular field, and of all other work of that particular class all over the world, thus securing that economy of expenditure and harmony of conclusions which is one of the reasons for the being and one of the unattained ambitions of the International Polar Commission. Many examples might be cited to prove the necessity of conditions which have just been outlined, and the grave risk and danger which their disregard incurs.

Individual explorers of the past have learned by dear experience the lessons by which the new school of exploration must profit. One immediate result of the changed conditions which the new school of exploration will compel will be vast improvement in the personnel of the explorers. All the best of the qualities, the daring and fortitude of the old school, will be needed; but there must be something more and very much more. The idea that physical suffering, starvation and deadly peril are necessary concomitants of exploration is no longer tenable. They may be encountered, and the real explorer will be ready for the challenge, but they are neither necessary nor inevitable. Modern equipment and the combination of means to ends will carry a man anywhere on the globe in safety and comparative comfort. And it is in this connection and relation that the new school will find one of its chief resources, for its organization will enable it to command the widest experience and all available knowledge, and construct from them a composite far more adequate and effective than would be possible for the individual and often meagerly equipt explorer.

The field of the exploration of the future, like ancient Gaul, is divided into three parts, over the portal of which is inscribed the question, "Where?" "How?" and "Who?" In other words, location, administration and personnel; and it may be well to suggest answers, tho they must be general and superficial. The field is the world. So long as poachers and pothunters are prosecuted and convicted within the limits of the City of New York, the explorer, the true nature-student, should not fear to paraphrase and appreciate the truth that exploration, like charity, may begin at home; and it is a scientific fact, easily demonstrated, that no area of equal size is richer in geological forms and results than that visible from any of the lofty towers of Manhattan. Every State in the Union invites the explorer; Alaska extends a welcome, to which the obstacles of an uncertain and unsettled Federal policy are not insurmountable; while the Panama Canal will soon open forces and bring next door the vast and virgin fields of South America. Africa is already interlaced by railroads around its exterior, and soon the systems, rail and river, will be interlocked and articulated, so that its rich and rapidly vanishing treasures, particularly in ethnology, may be saved and permanently incorporated in the world's knowledge. In Africa, indeed, at the present moment, is one of the best and most effective examples of modern exploration. An American expedition, carefully projected, intelligently equipt, which has for three years searched the great Kongo basin for types of mammals, of rare and rapidly disappearing species, known to be nowhere else, and sanctioned by the state and at peace with the natives, will soon return with a rich harvest, not only in zoology, but in other departments of science. What is more to the point, when this expedition has completed its work and its collections are studied and classified, that particular field is finished, and resources and energy may be directed to those awaiting study and investigation.

Of course, of all the world, South America, for obvious and familiar reasons, is the most inviting territory remaining to the explorer; and since we have been already and abundantly ad-

vised that mines and forests, gold, silver and rubber, beyond the potentiality of avarice, await the coming of the American and the Panama Canal short cut, it is easy to see that the explorer has no time to lose if his richest fields be not commercialized and appropriated. South America has been hospitable to Yale and Harvard and other accredited North American explorers, but her cabinets and commerce are under European influence. The little republics are growing rapidly in resources and their own esteem, and it is not likely that free and irresponsible rangers will long have the freedom which has enabled every adventurer since the fifteenth century to find in South America a wonderland. Fortunately every South American state is hospitable to legitimate exploration and development, ready to welcome foreign students and investigators, to co-operate with them, and to accept the results of their work, so that to the explorers of this new and little known continent there comes the double appeal of recognition both by the organization to which they are directly responsible and by the state in which the work is performed.

As to the method of modern exploration, obviously this discussion must be limited to preliminaries, *i. e.*, to the organization and general plans before departure for the field. As to what are commonly called "auspices" it has abundantly been demonstrated that neither the individual nor the government is ideal. With one, concentration of duty, particularly of raising the necessary funds, often the hardest part of the task, and of power, compelling the leader to carry the whole burden of the project in plan and execution, often proves too great a load, and the expedition pays the penalty. With the government in control, of course the financial resources are exactly defined, more often than otherwise too narrowly; and questions of rank, routine, precedence—in short, what is commonly known as "red tape"—hamper execution and impair efficiency. Even tho jealousy or criticism is spared, sooner or later some factor turning on "the good of the service" is likely to subtract from interest in the work, and that whole-souled, undivided devotion to it in general and in detail which is an imperative condition prece-

dent to its success. Europe has shown us the way to future exploration, for it and its methods are not unknown there. No better type of the modern expedition exists than Charcot's two to the Antarctic. Himself of high scientific as well as professional attainments, experienced in ice navigation and marine research, the official and public sanction of the Ministry of Public Instruction to his undertakings was readily accorded, and his scientific staff, in personnel and equipment, could not fail to command worldwide recognition of the memorable and far-reaching work which it accomplished. Organizations are already sufficient in America for the task of the modern explorer; some are already engaged in promoting his work, and a very immediate, not to say imperative duty presents itself to these organizations, to establish a "gentlemen's agreement" or some other *modus vivendi* by which harmony of operations, economy of means, financial and physical, and a just and intelligent distribution of fields and of results in them may be obtained. Modern exploration is or should be serious, permanent business, "a steady job," in the language of the day, and much valuable time and money may be saved by recognizing this fact. If the Fish Commission and the Carnegie Institute must have their vessels in continuous service and commission, could not the geographical bodies, or those which claim and ought to be, find work for one?

The personality of the explorer of the new school may be more easily recognized than defined, and the temptation to attempt pen portraits is strong. It should go without saying that he should be dauntless, resourceful, master of self and of others, of adequate physical and intellectual equipment. All these and more he should be if he is to be a leader. He should possess sound learning, mastery of special branches and sympathy for all, so that his entire force may be worked to its fullest efficiency, and conditions barren and unfruitful for some may be made the opposite for others. He should also be able to grasp any opportunities which circumstances may put in his way, to the end that all data may be conserved and properly distributed thru the general clearing house

charged with that duty. The credentials which he bears must be those of institutions of rank and influence, so that their attestation of his work will admit it unquestioned to the science of the world, and so that exploration will henceforth take its rightful place as one of the exact sciences. It would, perhaps, be more easy to define the ideal explorer of the new school by the process of elimination, by stating what he should not be. One thing is certain, it will not be difficult to recognize him, and one thing is even more certain, that he must be of

unimpeached integrity and untarnished honor.

What are to be the rewards of modern exploration? Ask Galileo, Newton, Columbus, any of the great living or dead. What reward is possible but the sense of duty done, of some extension and enlargement of knowledge? Exploration is only one of many hand-maidens of Science, and Science is for Man, not Man for Science. Unless the modern explorer can realize that he serves humanity and its progress, he has mistaken his vocation.

BROOKLYN, N. Y.

The Stranger

BY ERNEST RHYS

I.

If he is come from overhill
How is it that the dust
Upon his cloak lies fine as smoke,
Red as rust?

But, if he comes from out the north
Where the red country is,
Why turns he now not to the town,
Where flock the pilgrims, faring down
For the Easter Mysteries?

The bells ring sweet in the minster street,
As ever I heard them ring;
And sweet one hears the choristers
When they sing.

The townsfolk aisles and towers and bells,
And a Lord Bishop have,—
With candelabra in the choir
And the nave.

The hillsfolk here have but a barn,—
Bare, whitewashed like the farm
That lies beneath,—to keep their faith
Barely warm.

Their Preacher, with his wild hill-speech,
Brings them no Easter bell;—
He preaches gloom,—the Wrath to come;
Death and Hell!

The Stranger waits without their door,—
Ah, now their prayers begin,—
And now he bows his head, and goes
Softly in.

He does not know their wild hill-tongue,
Their Calvin's fatal faith;
Nor what they preach in desperate speech
Of dark Death.

Why should he tarry in their walls
Upon the hill this while?
What should he hear of Easter's Lord,—
Who might His Mystery have heard,
Within the minster aisle?

II.

The hymn of death the hillfolk sing
Is done; but ere it dies,
The stranger passes from the place,
What mystic rapture in his face,
What tears within his eyes!

Oh, what can he have heard within,
Of words that hearts can break?
What bitter cry? What Christ to die
For men's sake?

Oh, what can he have seen within?
For there no mystic Blood
Of our dear Lord is on the board,
As in true Holy Rood.

But thru the thorn-tree by the door
The sunlight shines and weaves
Above His Head, as he goes by,
A shadowed crown mysteriously,
Of thorns and leaves.

And now a white cloud o'er the hill,
Drops down, as he goes on,—
Above the white walls,—out of sight;—
He is gone.

III.

Then said an old man:—"I am old,
But such a look as His,
Who came and knelt here silently,
I have not seen, and shall not see,
This side the mysteries!"

He said,—“I surely saw the Christ
Break Time-and-Death's dark prison,
And show His Face within this place.
Christ is risen!”

Indeed, such light could not be seen
Save the Lord Christ came down;
But there are some that wonder still
Whether He came unto the hill,
Or the town.

LONDON, ENGLAND.

The Census and the Negro

BY BOOKER T. WASHINGTON, LL.D.

PRINCIPAL OF TUSKEGEE INSTITUTE.

WHEN the census figures of 1900 were published they revealed the fact that in the forty years since slavery the negro population had doubled. It was 4,441,830 in 1860 and 8,833,994 in 1900. Now that we are beginning to get returns from the 1910 census, we learn that during the past ten years the race has added almost another million (994,300) to its stature, so that according to the thirteenth census the negro population was 9,828,294, and if it has increased at the same rate since 1910 that it did before, namely, 11.30 per cent. for the decade, or about 100,000 per year, it is now considerably more than ten millions.

The importance of these facts is that it assures the physical existence of the race. The negro is not dying out. The rate of increase among negroes is not as great as it was some years ago, but that is true of every civilized country in the world in which the population is not increased by immigration. The census of 1911 shows, for example, that the rate of increase for the English people, measured by the excess of births over deaths, is 12.4 per cent. The natural rate of increase of the white population, excluding increase by immigration, was estimated at twenty per cent. in the period 1880 to 1890, and is not quite fifteen per cent. for the period from 1900 to 1910. The census shows that the white population is increasing more rapidly than the negro in the Southern States. This is due in part to the fact that, while there is a movement of the black population northward from the border States like Kentucky, Tennessee and Maryland, there is at the same time a movement of the white population southward, particularly in the direction of Florida, Louisiana, Oklahoma and Texas. The statistics show, for example, that while the negro population has actually decreased in the border States I have mentioned, and the increase in Virginia and Delaware was no more than 1.6 per cent., the

increase of the negro population in the Northern States was 18.4 per cent.

This does not mean, as some persons have said, that the negro population is shifting from the Southern to the Northern States. The fact is that the total increase of negro population in the North, during the decade from 1900 to 1910, amounted to no more than 167,879. During the same period negro population in the South has grown from 7,922,969 to 8,749,390, an increase of 826,421. As a matter of fact, the increase in the North over the South has been no more than one half of one per cent. of the whole negro population.

The truth is, that negro emigration from the border States has not been directed exclusively toward the North. On the contrary there has been, perhaps, an even larger movement of the negro population South and West. For example, in Arkansas, Oklahoma and West Virginia the negro population has not only increased in numbers more rapidly than in most other Southern States, but this increase has been more rapid than that of the white population in the same States. In Oklahoma the white population increased 115.5 per cent. from 1900 to 1910. In the same period the negro population increased 147.1 per cent. In West Virginia the percentage of increase for white was 26.4 per cent.; for negroes, 47.5 per cent. In Arkansas the percentage of increase for whites was 19.7 per cent.; for negroes, 20.7. In Florida, where there has been a large immigration from the North during the past decade, the negro population increased less rapidly than the white. In spite of this fact, the percentage of increase was 33.8, showing that there has been a very considerable negro immigration into Florida from other parts of the South. The average increase of negro population in the Southwestern States—Kansas, Louisiana, Texas and Oklahoma—has been 17.1 per cent.

Another striking fact which the cen-

sus figures have disclosed is that in the readjustment which is now taking place in the South between the city and the rural population, the negro on the whole remains in the country, while the white man goes to town. This is shown, for one thing, by the relative decrease of the negro population in all the larger cities in the South. The four cities which had a larger negro population than white in 1900 will serve as an illustration. These cities were Charleston, S. C., Savannah, Ga., Montgomery, Ala., and Jacksonville, Fla. In 1900 the population of Jacksonville was 28,429. In 1910 it had grown to 37,699. In 1900 there were 57 negroes in the population to 43 whites; in 1910 the ratio was 51 negroes to 49 whites. Montgomery, Ala., increased its population in the same period from 30,346 to 38,136. In 1900 the ratio of negroes to whites was 56 to 44; in 1910 the ratio was 50.6 negroes to 49.4 whites.

In the case of Charleston, S. C., while the population as a whole increased from 55,807 in 1900 to 58,833 in 1910, the negro population of the city actually declined. In 1900 the proportion of negroes to whites was 56.5 to 45.5; in 1910 it was 53 to 47.

Another fact which indicates that the negro is gaining in the rural districts, as compared with his white neighbor, is the rapid increase in the number of negro farmers. In every Southern State except Florida the census shows that the number of negro farmers has increased more rapidly than the negro population as a whole. In spite of the fact that the white population has grown more rapidly than the colored population in all but two of the fifteen Southern States, in only five of these States has the number of white farmers grown more rapidly than the negro farmers.

In conclusion, I do not believe I can

do better than quote a statement of President E. C. Branson, of the State Normal School at Athens, Ga., who, in a very interesting paper on farm life conditions in the South, sums up his own observation in regard to the negro as follows:

"Another significant economic tendency in the Southern farm life is the fact that negroes are resisting the lure of city life and sticking to the farm better than the whites. In every Southern State, except Kentucky, the white farmers are a lessening ratio. On the contrary, the negro farmers in the South, except in Florida, Louisiana and Texas are a growing ratio. In South Carolina and Alabama the negro population on the farm grew in the last census decade nearly twice as fast as the negro population in general in these two States; more than twice as fast in Mississippi, and nearly three times as fast in Georgia.

"On the other hand, there is the steady drift of white farm owners and white tenants cityward; the first for business opportunities and social advantages, and the last for work in the mills and factories. Thus the growth of urban population in Georgia was three and a half times, and in Mississippi, five times, the growth of rural population. Negroes rent the vacated farms and remain in the country, and oftentimes they move back into the country from the towns—a thing seldom true of the whites.

"Thus there are fourteen Mississippi counties in which the negro farmers outnumber the white farmers five to one; in four of these more than twenty-five to one; in one of them nearly thirty to one.

"And I may add, that the negro is fast rising out of tenancy into ownership. In ten counties of Mississippi the farms cultivated by negro owners outnumber the farms cultivated by white owners. But the increasing ownership of farms by negroes thruout the South is a conspicuous fact, even when they are thinly scattered in white communities. The fact appears so uniformly upon the county tax digests that it has ceased to be surprising.

"It means, of course, that the negro is working out his own salvation upon an economic basis. It may be that he is traveling along a hard, difficult road; but in simple truth there seems to be no other way."

TUSKEGEE, ALA.

Mr. Winston Churchill's Offer

BY W. T. STEAD

EDITOR OF THE REVIEW OF REVIEWS.

WHEN I wrote upon Lord Haldane's mission I stated in the plainest possible terms that any Anglo-German entente must leave both parties free to increase or decrease their naval armaments according to their own ideas of what their own interests demanded. I added that, so far as my opinion went, the British fleet must always be maintained at a standard of two keels to one. Not so very long ago the comparative strength of the two navies was as four to one. This we regarded as excessive, although no one in Germany at that time seemed to regard the four to one supremacy of the British fleet as dangerous to Germany. Neither was the ascendancy of Germany in the councils of Europe one whit less than it is today. We saw the proportion reduced from four to one to three to one without apprehension. But when the Germans went on steadily increasing every year the strength of their fleet we felt that some definite proportion of superiority must be asserted once for all. That proportion was defined as two keels to one, nor so far as I am aware was a single voice raised in Germany against a standard which corresponded with rough accuracy to the maritime and imperial interests on the sea which fleets exist to protect.

So far was this standard from being regarded at Berlin as "arrogant" or "overbearing" that when, just before the last Hague Conference I made a tour as a peace apostle through the capitals of Europe, endeavoring to secure support for a five years' cessation of the race of armaments, I everywhere based my plea upon the certainty that unless some standstill proposition were adopted, Britain would feel herself compelled to maintain the *status quo* by building two ships for every one built by Germany. I stated this to Prince von Bülow, then the German Chancellor, and to M. von Tschirsky, then Foreign Minister,

and from no quarter did I hear any protest or objection. The only object of Great Britain was to maintain the *status quo* by a cessation of building if possible, but if that were refused by building steadily at the rate of two keels to one. Hence the two keels to one standard was put forward as a pacifist proposition by me as Friedens apostol in the hope of staying the ruinous competition in armaments.

Since then the German Chauvinists, foolishly imagining that Great Britain could neither pay for nor man a fleet on the two to one standard, have indulged in vain hopes that if they only persevered John Bull would get tired and they might raise the proportion from two keels to one to three keels to two. In Mr. Winston Churchill's speech they have received their answer. Without borrowing a penny, without resorting to compulsory enlistment, the British Government will build two keels to one and will man the ships when built with eager and well-trained seamen. It is true that Mr. Winston Churchill consented to allow the proportion of capital ships to stand for a time at sixteen to ten or seventeen to ten. But that is only because behind the line of dreadnoughts there stands a great array of pre-dreadnoughts which, although no longer of the first class, suffice from their numbers to give Britain a practical working standard of two keels to one. As these older ships drop out it will be necessary to build two to one steadily without bluster and without menace in order to maintain the *status quo*. That some Germans may wish to reduce that standard is possible. But Great Britain cannot afford to indulge them in the gratification of that ambition. It is hideous and horrible, this wasteful competition, but the responsibility for this rests with the challenger, not with the power which merely asks that the naval *status quo* shall not be altered to her disadvantage. If so be

that the race must go on till we have spent our last penny, that last penny will be cheerfully spent before John Bull allows the standard of superiority essential to his existence to be altered to his detriment.

Great Britain stands for the *status quo*. She is prepared to accept a *status quo* based upon a standstill proposition. She is willing to accept a *status quo* based upon equivalent and simultaneous reductions. But if both these are denied her, then, if there be no other way, she will maintain it by building two keels to one till her exchequer is exhausted. At present she has not even been driven to borrow to maintain her place on the seas.

Mr. Winston Churchill's speech was frank, friendly and pacific. It was the first definite overture made in public by one great Power to another to check the headlong rush to ruin. Judging from the utterances in the German press, it has not been received in the same spirit. This is perhaps due to a certain feeling of irritation against the author of the unlucky phrase about the navy being a luxury to Germany and a necessity to Britain. But all that Mr. Churchill meant in his Glasgow speech was to point out that whereas an army was a necessity to Germany and a luxury to Britain, in the case of the navy the position was reversed.

The discontent and irritation occasioned by this pestilent naval competition is lessened by the comforting reflection that it is rapidly nearing its end. For my own part I am strongly of opinion that none of these great monsters,

dreadnoughts and super-dreadnoughts will ever fire a shot in actual war. They are like the cumbrous armor which reached the maximum of weight and unwieldiness just before the discovery of gunpowder made armor an anachronism. The Diesel motor engine will necessitate the scrapping of all the dreadnoughts, and the airship and the aeroplane will render the construction and repair of these monsters impossible. The late Count Aehrenthal saw clearly years ago that the future lay in the air. For my part as a pacifist I would willingly give up one of the new super-dreadnoughts if I might spend the two millions sterling which it will cost upon the airship and the aeroplane, which will wipe out frontiers, render fortresses untenable and destroy the bases where fleets are equipt.

All this arming and counter arming is unworthy of civilization. If ever there should be a great central European war, it will not be decided by armies or navies. It will be settled by starvation. There are too many people in Central Europe whose daily bread depends upon the smooth functioning of railways and steamships and banks for war ever again to be fought to a finish. It is the millions of non-combatants deprived of their food who will settle the question. For a man without food speedily becomes a savage, and in time a cannibal, as the most docile of sheep dogs if starved long enough becomes a wolf. When men discover that civilized society has become too complex for nations to fight without dooming the masses to death by famine, war will cease of itself.

LONDON, ENGLAND.

Workingmen's Expenditures

BY WILLIAM B. BAILEY, Ph.D.

ASSISTANT PROFESSOR OF POLITICAL ECONOMY IN YALE UNIVERSITY.

DURING the years 1907-8 an investigation was made, under the direction of Robert C. Chapin, of workingmen's families in New York. One of the most interesting results of this study was the determination of the relative importance of the items of the expenditures of these families. The families were classified, according to their expenditure, in ten groups. In the first group the expenditures were from \$400 to \$499; in the second group from \$500 to \$599, and so on, with the gradual increase of \$100 in each group. The largest number of families were found to spend between \$700 and \$799, and can be taken as the model of families investigated. The average number of persons in each family was 5.1, and the average expenditure in this group was \$735.98. The average income for the same group was \$749.83, leaving a very small margin when the expenses for the year had been met. The amount spent for different items is as follows:

Food	\$335.82
Rent	161.36
Clothing	98.79
Sundries	60.28
Fuel and light.....	36.94
Insurance	18.24
Health	14.02
Car fares	10.53

The sundries included such items as furniture, taxes, dues, recreation and amusement, education and reading, together with tobacco, intoxicants, etc. The average amount spent by this group for furniture was only \$8.22 for the year; on recreation and amusement only \$7.07 for those who could afford anything, 15 per cent. reporting no expenditure. The families which reported expenditure for education and reading could allow but \$4.93 on the average for it. The average amount spent by these families on tobacco was \$10.81. The average amount expended for alcoholic drinks was \$32.52, but about two-thirds of this was consumed at home, and included under the item of Food.

NEW HAVEN, CONN.

Literature

When Ibsen Dead Awakens*

THE new edition of Ibsen, which is to be sold by subscription, marks the crowning point in Mr. Archer's career as a translator. The eight volumes before us at the present writing are splendid examples of typography, printed in clear face on paper specially water-marked "H. I." The backs of the sateen cloth binding present as formidable a front for the library shelves as Ibsen showed in his frockcoat when he faced the opposition which each separate play had to combat before being recognized.

Since the fall of 1877, Mr. Archer's name has been closely identified with that of Ibsen. Mr. Gosse shares with him the distinction of having started the English appreciation of the dramas. But the work Mr. Archer has done is a notable instance of literary faith kept from first to finish. The remarks in his general preface to this "Viking" set lead one to believe that Mr. Archer now considers his profitable task at an end. Ibsen died in 1906, since which time there has, in all likelihood, appeared whatever miscellany will serve to fix the dramatist for the future. Therefore, in the final estimate of Mr. Archer, we must approach the "Viking" edition as definitive.

We should distinguish between this *de luxe* set and the "copyright edition," which was wholly adequate for popular use. Since the publishers have gone to the outlay of placing the English Ibsen in new and sumptuous form, and since the translator intends this to be the authoritative edition for English readers, he should, as an editor, have been even more progressive than he has been in the introductions to the different plays.

The publication of Ibsen's "Literary Remains" brought to light a mass of ma-

terial which if it did not serve to shift the critical point of view, at least necessitated the addition of many interesting data to Mr. Archer's introductions—data totally lacking in the "copyright edition."

I take it that a definitive edition should include *all* of an author's work which finds place in the authoritative editions of other countries, and especially of his own. It strikes me that while *From Ibsen's Workshop* is intensely interesting, even tho it only aims to illustrate the modern dramas—its incompleteness is shown by such remarks as the following, made by Archer in his introduction to "Emperor and Galilean":

"The sketches and drafts of the 'world-historic drama,' published in Ibsen's 'Literary Remains,' are so significant, both technically and as throwing light on the process of his thoughts, that they deserve far more detailed study than I can here devote to them."

Such a declaration makes us deplore the fact that nowhere in the "Viking" edition will one be able to find these data. Furthermore, the publishers should have arranged for the inclusion of all the Ibsen letters, now published by other firms. Mr. Archer, in spite of his assertion that "Catiline" is valueless, autobiographically, since Ibsen altered it in later life, should have translated it. Certainly the French and Germans have not ignored it. Some one should have translated Ibsen's poems, which in embryo contained the germs of many views afterwards amplified in the plays. Nowhere in this edition can one find Ibsen's essay on the Saga, which means much in the study of the Saga dramas. Nowhere is there any indication that Ibsen wrote stories. Often we are told that Ibsen at critical moments delivered himself of a speech. The English translator has seen fit to omit all such significant data.

Mr. Archer's introductions are illuminative and just. He has made changes in them, even to the point of rewriting many pages. Professor Herford has also lengthened, we might almost say rewritten, his foreword to "Love's Comedy," thereby presenting a much more

*THE WORKS OF HENRIK IBSEN. Edited with Introductions by William Archer. Viking Edition. Thirteen volumes. Vols. I-VIII. Sold only by subscription. \$2 per volume. New York: Charles Scribner's Sons.

*FROM IBSEN'S WORKSHOP: NOTES, SCENARIOS AND DRAFTS OF THE MODERN PLAYS. Translated by A. G. Chater. With Introduction by William Archer. New York: Charles Scribner's Sons. \$1.25.

vivid idea of the fermenting mind of Ibsen when he first went to Christiania. Now and again Mr. Archer makes use of new critical data from German and Norwegian sources, but generally he relies upon his own knowledge of Ibsen for the critical passages. And that knowledge has not deepened very profoundly. I should say that some of the students of Ibsen have left the pioneer very far behind. The notes to Professor Olson's edition of "Brand," for example, have a value for English readers that Professor Herford and Mr. Archer fail to suggest. On the other hand, the introduction to "Brand" has been wisely lengthened, and in the course of it we are introduced to the "original" minister, Bruun, of Christiania.

One small matter of neglect should be noted. I refer to the stage history of Ibsen's plays. Indifferent search was made; hence Mr. Archer falls many times into error. For instance: Speaking of "The Wild Duck," he writes, "Of American performances I find no record." Was there no one to tell him of Wright Lorimer's venture? Speaking of Ellen Terry's performance of "The Vikings at Helgeland," he claims it to have been the only performance in the English language. Was there no one to inform him that the Sargent School produced the play in as excellent a manner as one could desire? Tho he mentions Nazimova as Nora, he fails to call attention to Orleneff in "Ghosts"—a Russian actor, who, it may be noted in passing, is ardently expounding Ibsen in New York at the present time, even acting the whole of "Brand." Halvorsen's "Bibliography" is a model for the future English student of Ibsen.

From Ibsen's Workshop simply illustrates how plays are built, and how Ibsen himself went about building. It shows how rapidly his mind changed, from scene to scene, in a scenario. Page after page of discarded matter was preserved by him. Sometimes his analyses light up the finished product; sometimes his self-interest is seen, as when he suggests that Nora dance the "tarantella" to the Grieg music for "Peer Gynt." Wherein the plays differed from the scenarios, is of not as much importance as it is of in-

terest. It is unfortunate that Mr. Archer did not himself translate this book. The excerpts from the "Literary Remains," used in some of his introductions, indicate that he differs in style from Mr. Chater, who translated "From Ibsen's Workshop."

Theodore Thomas

THEODORE THOMAS was more than the greatest American pioneer in the field of music, for we may even say that no other musician ever wrought so valiantly or accomplished so much for the musical education of any people as Thomas did for the people of America. For fifty years he performed Herculean tasks for musical culture, traveling hither and yon across this vast country with one of the finest orchestras ever assembled, and to him more than to any other man belongs the credit that today the best music is appreciated in American cities from the Atlantic to the Pacific. The bare record of his career is romantic enough to make an interesting story. In reviewing his almost fragmentary "Autobiography" seven years ago THE INDEPENDENT expressed regret for its brevity and "that it does not tell enough about his remarkably long, significant and interesting career." His widow has now told the story of that career* in such detail as it deserves, and has told the story with such skill, sympathy and charm as to make it the most fascinating and one of the most important of books on music in America that has yet appeared.

She has succeeded remarkably well in combining her materials into a concrete, complete and organic biography, and it is just her occasional touches upon the deeper intimacies of his life that make it a full-length portrait. The world already knew Theodore Thomas as a tireless fighter, possessed of prodigious strength—tho it had forgotten, perhaps, some of the multitudinous adversities that one after another beset his progress—knew something of his indomitable will and his unfaltering pursuit of a high ideal; knew him as a man of noble character. It knew also that he was

*MEMOIRS OF THEODORE THOMAS. By *Rose Fay Thomas*. New York: Moffat, Yard & Co. \$3.

often taciturn, irascible, brusque, and that his nature was not without a streak of jealousy. The account of his home life, which it was a real hardship for him to forego during his many and long trips about the country, of his ideal relations with his family and with certain intimate friends, and the extracts from his personal letters, show the mellow, finer side of his character which the world did not know—his capacity for deep and lasting affection, his love for his fellow men, his self-sacrificing loyalty to his musicians, his kindliness, his love of nature, his aspirations for the broadest culture, of which music was only a part, his love of his foster-land—for American patriotism was a veritable passion with him. And the complete record shows that he triumphed as a master and leader of others because first of all he mastered himself.

That Thomas was a born conductor, as well as a man at whose door opportunity had not to knock a second time, was shown by the circumstances of his first call to leadership. One evening in 1860 (Thomas was then twenty-five and accredited as "America's most accomplished violinist"), he had gone to his room to rest after a hard day's work, when word was brought that the conductor of the opera at the Academy of Music was sick. The audience was seated ready for the performance to begin. Would Thomas conduct? He never had conducted. He was not familiar with the opera to be sung (Halévy's "Jew-ess"). But he did not hesitate. And his conducting was so successful that it determined his life career. He remained with the opera for two years, and then established a concert orchestra and entered upon his great pioneer work.

Thomas was fond of reading, was a student of the world's best literature, always carrying with him to read on the train one or more good books. He avoided trashy books just as he shunned trashy music. He was never willing to listen to vulgar talk or to witness immoral plays. He said:

"A musician must keep his heart pure and his mind clean if he wishes to elevate, instead of debasing, his art. And here we have the difference between the classic and the modern school of composers. Those old giants said

their prayers when they wished to write an immortal work. The modern man takes a drink."

For the performance of such a work as Beethoven's Ninth Symphony he prepared himself not only by serious and intensive study of the music, but even by what constituted a form of prayer and fasting—a regimen of baths, frugality and solitude.

Among the many interesting letters Mrs. Thomas prints, from eminent composers and musicians, some of the best are from Richard Strauss, whom Thomas addressed (in 1903) as "the greatest musician now living and one of the greatest musical pioneers of all times," and of whom Mrs. Thomas says:

"The gratitude of this great composer for the recognition given him by Thomas was a striking contrast to the egotism and greed of Wagner, for whose art Thomas had done so infinitely greater a service. Strauss never forgot the helping hand thus held out to him when he was young and unknown, or lost an opportunity, as long as Thomas lived, to express his appreciation."

Thousands of friends and admirers of Theodore Thomas will be made glad by this beautiful account of his life work, sound appraisal of his noble character, and worthy tribute to his memory. We beseech the publisher to provide an index in the next edition.

Recollections Grave and Gay. By Mrs. Burton Harrison. New York: Chas. Scribner's Sons. \$2.50.

A daughter of old Virginia stock is Mrs. Harrison, a Cary and a fragment of a wide-spreading family tree in the Old Dominion, with roots in many States and branches that seem, in her rich, sad, glad tale of early days, to have received almost more sunshine than one would have suspected as due to the temperate climate of that mother State of Presidents. To the glimpsy, oldtime singing leaves of the family tree she devotes much space, as is the fashion now of the children of the South, making it her duty perhaps to find, in her reminiscential way, as many "dears" and "darlings" as possible, and rather more brilliant "beauties" than are usually allowed even to capitals. Tho the Whig antecedents and a non-slaveholding house at the war period, the old black mammies

come into her story naturally enough. They all love the "missis" and the "marsa," and find freedom difficult and somewhat disappointing. In the North, apparently, one sees them in a state of careless independence, sitting on the fence five days in the week, lamenting the good old days when they were taken care of—the blessed state of slavery when they would like to—well, might not have liked to, but did, in the war period, always have a basket of young chickens for white folks at the front who were losing legs and arms in defense of the blessed institution. This aspect of the situation does not often, however, disturb the picture of the light, gay and sad pages of Mrs. Harrison's remembered life at the little Richmond center of strenuous activity. She cares rather to preserve the little prettinesses that made the home coming of soldiers cheerful even when the thunder of guns was to be heard nightly on the Richmond outworks. She was a girl in the suburbs of officialdom. She saw much of the shoulder straps, heard the whippers in Cabinet circles, wept when the drums were muffled, cheered when the bugles rang, improvised fantastic dramas on the mimic stage when there was a lull in the awful drama of war about the capital. One almost wonders at the amount of ribbons, bonnets, old lace revamped, finery donned behind the scenes to make a shiny background for bloody fields and wounded knights. She sees and tells much that has never been better told of those dark days, not shrinking from the desperate expedients of the Southern chivalry at the last to put a bright face on a fading cause.

The Passing of the Idle Rich. By Frederick Townsend Martin. Garden City, N. Y.: Doubleday, Page & Co. \$1.

In contrition and shame Mr. Frederick Townsend Martin has turned state's evidence against his class. With the intimate knowledge of one born to the purple he exposes the luxury and waste, the insipid, costly pleasures, the destructive vices of those "who toil not, neither do they spin." The complacent conviction, in which, he says, he was raised, that the rich were as beloved as they

were envied, has yielded to the distressful feeling that parasites are hated and idleness evokes disdain. So, oddly enough, he first published in a popular magazine and now issues in a cheap and unpretentious style these sermonic chapters addressed mainly to millionaires, chapters in which, with intentions finer than the literary form, he tries to accentuate those twinges of conscience which, he declares, the darlings of fortune already feel. His remedy for parasitism—"Let the rich go to work"—is pitifully inadequate. Tho the work they do may save them from ennui, it will hardly help the country. Tho the heirs to millions peddle bonds at \$15 a week (hardly enough to pay for gloves and neckties), as the author admiringly relates, no improvement will follow. If they fail or get weary they will still spend more than a score of industrious mechanics; if they succeed they will learn how to inflate further their already swollen fortunes. However, the book is worth while as a sign of the times. If the idlers in the most exclusive clubs are worrying about social ills, their opposition to radical reform may be undermined; but not till society really arranges that if a man will not work neither shall he eat will the gilded youth of Mr. Martin's solicitude put their hands to the plow.

The Women of Tomorrow. By William Hard. New York: The Baker & Taylor Company. \$1.50.

Prof. Charles Zueblin says of Mr. Hard's book: "The woman of tomorrow will not differ from the woman of yesterday in femininity or physique or capacity, in her charm for men, or in her love of children, but in the response of her eternally feminine nature to a changed environment." Mr. Hard devotes his chapters to five critical phases in the life of the woman of today: The postponement of marriage; the preliminary period of self-support; the new training for motherhood; the problem of leisure; the opportunity for civic service. As the volume is made up of articles originally appearing in *Everybody's Magazine*, the style is humorous and vivacious and the statistics intelligible and palatable. That there are 2,260,000 American women over twenty-five years

old and still unmarried, is a portentous fact that has to be faced by the sociologist, and the author meets it gallantly, not as a situation to be altogether deplored, but one to be taken account of in our schemes for the education of girls. They must be trained for efficiency in some practical vocation. At one time every girl was in a trade school in her own home; that day has passed and the schools must supply the need for vocational training. The chapter on "The Wasters" is bitter in its condemnation of the "shirking girl, whose job is being nice." Certainly that is a much more creditable job than being disagreeable, but there is a great deal of unpalatable truth in Mr. Hard's strictures upon "a nice child's life, full of small things that look big" to a modern girl, but utterly unworthy of a real woman in a real world. It is a comfort to learn from these somewhat drastic pages that there are plenty of worth-while jobs to occupy the leisure of the women of tomorrow, and that they are capable of genuine service to the world in every field of effort, not excluding that of political affairs.

Rayton: A Backwoods Mystery. By Theodore Goodridge Roberts. Illustrated by John Goss. Boston: L. C. Page & Co. \$1.25.

Rayton is a person in riding-breeches, and the scene of this story about his adventures seems to be a point somewhere near the jumping off place; but Samson's Mill Settlement is not a Roussellian Arcady, since the men there play poker from the very first chapter. Between the woods, the games of cards (with their "Mystery") and the eternal game of love there is surely enough here to interest any reader in quest of light diversion.

Literary Notes

....The Putnams have just issued a third edition of Prof. G. L. Raymond's novel dealing somewhat humorously with church conditions. It is entitled *Modern Fishers of Men*.

....The March number of the *Annals of the American Academy of Political and Social Science* (Philadelphia; \$1) is devoted to *Country Life* and contains a large number of useful articles on rural, industrial and social problems.

....Four brief poems in a thin volume, *The Light of the Gods* (Cosmopolitan Press, New York; \$1), show the eager historical mood of Miss Grace Granger, and are pleasant reading.

....*The Student's Illustrated Historical Geography of the Holy Land* (Sunday School Times Co.), by W. W. Smith, M. D., is a convenient handbook for Bible classes and teachers. It contains a good bibliography and a list of picture materials.

....In *Sunlight and Starlight* (Richard G. Badger, Boston; \$1.50) Henry G. Kost finds music in many things, in "Old Periodicals," in the "Electric Car," and of course, in "Fiddle Notes" and 125 pages of equally nourishing intellectual themes.

....*The American Teacher*, edited by Henry R. Linville and B. C. Gruenberg, is a small but ambitious monthly, for it aims at nothing less than "the realization of the democratic ideal in all matters affecting the schools." (New York: Meads Publishing Company; 50 cents a year.)

....The latest addition to the long list of the periodicals published by the University of Chicago Press is *The English Journal*, the official organ of the National Council of Teachers of English (10 numbers a year, \$2.50). The February number is chiefly concerned with the new university admission requirements and methods of preparation for them.

....Marooned on an unknown island is an old tale which Mr. Cyrus Townsend Brady has varied in *The Chalice of Courage* (Dodd; \$1.30), by isolating his lovers in a fastness of the Colorado Mountains. He has succeeded in fixing in his story some of the real romance of the West, undefiled by the usual literary jargon of cowboys, saloons, wild bronchos and cattle stealing.

....There is much gentle satire and shrewd observation of human nature in Annie Trumbull Slosson's book, *A Local Colorist* (Scribner's; 75 cents), written in good, Connecticut dialect and with "local color" spread on with a palette knife. The best of the stories is that of "A Dissatisfied Soul," compounded pretty evenly of the grotesque and the creepy; a ghostly tale of "a woman who came back."

....A pleasant story of Oxford, of the town instead of the gown, in which life is as slow moving as the gentle river, is *Mr. Wicherly's Wards* by L. Allen Harker (Scribner's; \$1.25). Two lively boys and a small and original girl are the wards, and Mr. Wicherly's care of the three, while that of a bachelor and a scholar, is of the wisest psychology—albeit at times bewildered by the vagaries of his charges.

....A new issue in the *Macmillan Standard Library* is *Rational Living*, by Henry Churchill King (50 cents), first printed in 1905. The author, in his many volumes of thoughtful and spiritual addresses and essays, is one of the foremost interpreters of rational living by the means of rational writing.

....An unusual tale of mystery, in which the reader is in the author's confidence from start to finish and yet which holds his interest and attention, is *The Mystery of No. 47*, by J. Storer Clouston (Moffat, Yard & Co.; \$1.10). A wife, impersonating the cook in a domestic emergency, is supposed to have been murdered by her husband, and the serious personages from Scotland Yard, as well as an investigating bishop, are led thru a series of diverting adventures.

....*Amateur Garden Craft* is the fourth of a series of practical books on gardening, not so much for the specialist as for the un-instructed learner of the art. It gives in a simple way instruction in the care of the more common and effective plants, and the rules for the seasons in the garden. The book is not what we would recommend to an expert, but will be useful for those for whom it is intended. (Lippincott; \$1.50.)

....In an attractive booklet, issued by the New Church Board of Publication, the Rev. John Goddard answers the question, *What Constitutes Spiritual Living*, and shows how it may be realized in the world today. The author regards spiritual motives, fostered by meditation and religious exercises, and the practical guidance guaranteed by obedience to the law of service as the chief elements in forming the ideal spiritual life. The style of the essay is clear and the tone devotional and reassuring.

....English readers now have a chance to know something more of the Swedish dramatist, August Strindberg, than his name and fame since Edwin Björkman has translated three of his *Plays* (Scribner; \$1.50 net). The shortest of them, "The Link," is a divorce court scene. The others, "The Dream Play" and "The Dance of Death," are so heavy with mystic symbolism that we are not sure that we got the author's meaning, tho we are quite sure that if we did get it we did not like it.

....The subject of death occupied the mind of Maurice Maeterlinck from his youth and it forms the theme of some of his most poignant plays, such as "The Intruder" and "Tintagile." He returns to it now in an essay, *Death*, published by Dodd, Mead & Co. (\$1), but in a very different and far more hopeful spirit than formerly. His present outlook will still appear vague and unsatisfactory to the devout Christian, but it is something to have

advanced from being afraid of the dark to a point where he looks forward to infinite development and assured felicity.

....*Joseph in Jeopardy*, by "Frank Danby" (Mrs. Julia Frankau), is one of those novels in which people are subjected to temptation as dangerous as the art of the author can make it and saved "yet so as by fire" in the last chapter. The Venusberg music is rather too loud and insistent in the author's orchestration. It is lucky for the latest Joseph that he is a passionate lover of cricket and has something of the modern athlete's admiration of health and wholesomeness of body and spirit. (Macmillans; \$1.35.)

....Rome is the unchanging stage-setting for many more romances than those written by Marion Crawford; and the dull gold of the ancient frame gives the pictures painted by modern authors a dignity not always their own. *A Painter of Souls* by David Lisle (Stokes; \$1.25) is one of the best of recent stories of Rome. Its atmosphere is that of artists, art patrons, and art lovers, and there is a brave defense of the painting of Carrière, and his followers. One of his pupils, a frank young Irish portrait-painter, is the hero who dares paint the souls of his patrons.

....Leonard Merrick's *The Actor-Manager* is a novel of distinction. In the first place, its pictures of the stage-world in and out of the theater are both vivid and altogether authentic. Furthermore, the insight into the character of the men and women who move thru the story—the Actor-Manager himself, the woman he loves, the woman he marries, the "angel" friend who brings the action to a head, and even all the minor figures—is remarkable in its penetration. The first American edition of this deftly managed novel of the English stage is brought out by Mitchell Kennerley (\$1.20).

....In *The Egyptian Conception of Immortality*, by Prof. George A. Reisner (Houghton Mifflin Co., Boston; 85 cents), we have one of the annual lectures on Immortality given at Harvard University. Professor Reisner is an expert on both Assyriology and Egyptology, and for that reason attention may be given to his belief that the worship of Osiris entered Egypt with Semites from Asia somewhere about 3000 B. C. It is merely a form of the Tammuz-Adonis myth, but much developed. In this, as in the date, our author differs from the German school led by Professors Meyer and Erman.

....The illustrated family quarterly is a peculiarly German type of magazine. That it can be transplanted to our soil is shown by the recent appearance of the *Deutsches Magazin* (Winona, Minn., Publishing Company;

75 cents per year, 20 cents per number). It uses the German type and keeps to the traditional department arrangement of the German family periodical, but many of its stories and articles and even the poems and jokes are translations from the English. We wish success to this endeavor of the publication to introduce America to German-Americans of the first generation and Germany to those of the second.

....E. P. Dutton & Co., New York, bring across the water from England an ambitious drama, *The Masque of the Elements*, by Herman Scheffauer, who takes a large contract, namely, to unsphere the sun, moon and all the planets, reintroduce Chaos and Old Night, and in a somewhat difficult and unsatisfactory personification of the ghosts of these huge creatures to accommodate them to the modern stage. In ancient days such beings existed in the vivid imaginations of the uninstructed mind. Today the stage would require the wireless telegraph to connect its parts. Yet Mr. Scheffauer is not without good equipment in the poetic art.

....Among the additions newly made to the Home University Library, published by Henry Holt & Co., at fifty cents per volume, is a volume, *Landmarks in French Literature*, by G. L. Strachey. We find this little book a model, in its way. Reviewing French literature, from the beginnings down to Maupassant and Verlaine, in some two hundred and fifty pages, sextodecimo, the volume escapes any suggestion of perfunctoriness. The phrasing is crisp and pungent, the judgments free yet not freakish. Necessarily, the evolution of French letters is treated on broad lines; this is indicated in the title. Other additions to this excellent series are W. Warde Fowler's *Rome*, A. F. Pollard's *England; A Study in Political Evolution*, Sir T. W. Holderness's *Peoples and Problems of India*, A. G. Bradley's *Canada*, J. J. Findlay's *The School*, R. R. Marett's *Anthropology*, and Bertrand Russell's *Problems of Philosophy*.

....Senator Theodore E. Burton of Ohio is well qualified to deal with such a topic as the relations of *Corporations and the State*, and his book is eminently readable and at the same time a valuable reference work. He analyzes the causes of the growth and power of the great corporations, their relation to the public welfare, the attitude of the state to the corporations in America and in the nations of Europe, and the various proposed forms of regulation of interstate business. Senator Burton himself favors the plan of Federal incorporation, preferably voluntary, for corporations organized on a national scale, coupled with such Federal laws as regards publicity, honest management, and fair methods of

competition as may be found necessary. Six chapters of the book consist of lectures delivered on the Harrison foundation at the University of Pennsylvania in 1910. The seventh chapter is more recent and consists in a summary of the decisions of the Supreme Court in the Standard Oil and American Tobacco Company prosecutions. The appendix of the work is especially valuable to the student since it contains among other matter the text of the opinions of Chief Justice White on these two cases and Justice Harlan's dissenting opinion in the Standard Oil case. (Appleton; \$1.25.)

Pebbles

SHE—How did they ever come to marry?

He—Oh, it's the same old story. Started out to be good friends, you know, and later on changed their minds.—*Puck*.

THE DAWG SONG OF THE ARCTIC

I'm glad to stay right here in town,
I won't go to the polar groun',
Makes no difference if you win a crown,
You've gotta keep eatin' your dawgs aroun'.
—*New York Sun*.

A CARD TO MY SAN MARCOS FRIENDS.

The unusual severe winter and Meningitis caused such a stagnation in my line of business, that I thought seriously of quitting Carpentering, and applying for a position as teacher of a Mexican or negro School, thereby acquiring the title of Professor, but having recently discovered that the sewerage water on the Brain had become a raging epidemic and while not dangerous and (Side walk oratory never is dangerous). I will continue to be cussed and discussed for some time. It has eradicated from the minds of our citizenship all fears of meningitis and I hope that we will in the near future assume a normal condition of mind.

Therefore have decided to cling to my trade, and I am ready to do anything in my line of business. I have recently been encouraged to continue doing screen work.

I read a sermon from an able Baptist minister (Dr. Brooks) and among many good things he said in regards to who is a Christian this being his subject, One was that any one who followed screening houses was doing a Christian work. Some Parsons are too verdant to conceive this. It takes a big Gun to see things as they are, and as my desire is to continue doing a Christian work thereby strengthening the assurance that I already have, that when I take my final leave from this planet, I will get a location on the other one on Silk Stocking Ave., so far away from the hot place that it will not be necessary for me to hold a Negro between me and the fire. So my friends if you need me to do screen work or any other carpenter work call me up at Webb and Co's Lumber Yard, where my shop is or at my home. Yours truly,

R. J. SMITH, Box 4 San Marcos, Tex.

—*San Marcos (Texas) Times*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, \$3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of *The Independent* are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The Japanese Specter

LAST week Tuesday the Senate adopted a resolution calling upon the President to transmit to them

"any information in the possession of the Government relative to the purchase of land at Magdalena Bay [Mexico] by the Japanese Government or by a Japanese company."

This resolution was introduced by Senator Lodge, who, with the exception of Mr. Roosevelt, is more responsible than any other man for the recent mutilation of the peace treaties with England and France.

The Washington correspondent of the *New York Times*, who, during the progress of the peace treaties thru the Senate, has more than once seemed to have been inspired by the Lodge point of view, says in a despatch of April 5, after the Premier of Japan had explained the utter innocuousness of Japan's activities in Mexico:

"The impression in official quarters is that Senator Lodge, in introducing his resolution, merely intended to give an impetus to the desire of his friend, Secretary Meyer, to put thru his program for an increase in the navy."

While we would not place undue weight on the utterance of a single correspondent, there is no doubt that the

activity of Secretary Meyer in berating Congress for refusing to appropriate money for the customary two battleships at this session, is open to severe censure. It seems to us that if it should turn out that he is responsible for this fresh insult to Japan simply to boost his battleship program, his usefulness in the Cabinet is ended.

We hope, therefore, that when President Taft, a true and proved friend of Japan, replies to the Senate he will take occasion to speak out his mind concerning these war-mongers, past and present, who have left no stone unturned to disrupt the historic friendship between Japan and the United States.

The time has at last come for the American people to take effective measures to stop hereafter all these calumnies against Japan. Every time they come up they are invariably proved to be without foundation. But in the meantime the news has been cabled across the Pacific, and then the harm has been done.

From the day when Commodore Perry opened Japan to the world, Japan has lost no opportunity to express her gratitude to us. Even today she will do anything we ask of her, provided she can do it with dignity. With the exception of the preservation of the Anglo-Japanese alliance there is nothing that Japan so courts and cherishes as our good will. It is inconceivable that she would think of defying the Monroe Doctrine and thus risk our friendship and our great market for her exports simply for a paltry coaling station 500 miles from anywhere.

If it were worth while we could give concrete case after case where Japan has gone out of her way to conciliate us, despite all our recent pin-pricks. We shall refer only to the latest instance. Last year, when it was thought that England and the United States were about to negotiate an unlimited arbitration treaty, Japan voluntarily consented to a modification of the Anglo-Japanese alliance, so that in case of war between Japan and the United States, England would not have to choose between breaking her peace treaty with us or her alliance with Japan. Surely Japan never would have consented to cast off Eng-

land's aid if she had expected trouble with us.

If we had direction of the Carnegie Endowment for International Peace we would employ Detective Burns to investigate the genesis of these perpetual war scares. He might find out things that would furnish as good newspaper "copy" as a real war scare. The late David J. Foster, chairman of the Committee on Foreign Relations, whose untimely death has been an irreparable loss to the House of Representatives, was quoted in the *Evening Post* of April 23, 1911, as saying:

"I am absolutely convinced that there is a criminal conspiracy on foot for the purpose of bringing on a war between the United States and Japan. Thousands upon thousands of dollars are being spent to carry on this propaganda. . . . I am convinced that this constant agitation for a war between the two nations is nothing but a subterfuge employed by these people who are determined that this Government shall build not less than two battleships each year. To endanger the friendly relations of two great nations in order that certain selfish interests may be gratified is nothing short of criminal."

When there are no plausible reasons why this war talk should continue, then look to those who may profit by it.

At this very moment, when the great naval appropriations are under consideration, perhaps the armor and ordnance lobby may have some light to throw on the situation. By a curious coincidence a similar anti-Japanese war cry is being used in Australia at the present time so as to get money to upbuild the Australian navy.

Why will not the American people believe once and for all that Japan has only the best of feelings for us? The evidence is overwhelming for any one seeking the truth. We are the ones who in every instance have offered provocation. If there is ever trouble between the United States and Japan it will be because we deliberately seek it.

Trusting the People

WE hear much nowadays about trusting the people and the rule of the people. It may be well to consider the matter with some clearness and frankness.

What are the people? They are the body of the individuals in the town or city, State or nation. These individuals

are of various sorts. Some are men, some women, some children; some intelligent, some ignorant; some good, some bad; some rich, some poor. Some have power and influence, some are paupers or convicts. When we speak of the rule of the people we mean the equal right to the ballot of all these to whom by law the ballot is not forbidden. They all have an equal right, rich and poor, intelligent or ignorant, good or bad, to select those who shall make and execute the laws. This we call a republic, which is our form of government. But of late the expression, the rule of the people, is having a different application. It is used to mean the direct act of the total people by their votes to make the laws, and summarily to depose executive or judicial officers with whose action the people are dissatisfied. This approaches a democracy, rather than a republic. It does away, to a certain extent, with the intermediate representatives of the people.

Now which is the better way, the republic or the democracy? We prefer the democracy where possible, and where the people are fit for it. If the majority of the people are fit for it, and the conditions of intercommunication allow, by all means give us the democracy, the enlarged town meeting.

But a great many are not fit for it. That may be frankly admitted. The vicious and the ignorant are not fit for it. If the community were made up of them it would be impossible to have a good and stable government. We can afford to let them vote because we believe the large majority to be moral and sufficiently intelligent. They can outvote those who have no right to the ballot, but to whom we give it as a privilege because we cannot segregate and separate them, or only a comparative few of them, in prisons and poorhouses, and to these last we deny the ballot. A multitude of those who vote are just as unfit to vote as are the prisoners and the paupers. But we are right in giving it to them because they will, we think, be overborne by the competent; and we further think that the privilege educates them, and compels us to use our best force to raise their standard. Under our system of education it is safe; under other standards it would be unsafe.

Now there are grades of virtue and

vice, of intelligence and ignorance. In this country a fair degree of intelligence and a fair degree of virtue can be assumed for a large majority of the people, except in limited sections. Of these a small fraction are of tried and safe virtue, and of these a considerably smaller part are of high intelligence and wisdom. These are the men that are competent wisely to influence and direct the course of public opinion. The fairly good and competent recognize them and follow their direction. They have not the power to initiate and direct, but when told they are able to weigh the arguments and will do as they are advised. They know enough to choose the competent men as their representatives, to make and execute the laws in their behalf. When they form the great mass of the population and attend to their duties a government, no matter how democratic, is safe.

At present there is, as we have said, a tendency to seek more direct rule of the people, that is, more democracy, as against a republic. The cutting down of time and space by the telegraph, the telephone, the railroad and the trolley, and especially the newspaper, makes this tendency easier. We see it in the initiative, the referendum and the recall. But there is a counter movement which must always be recognized, coming from a distrust in the rule of the people, owing either to the lowered moral tone and intellectual caliber of the people, or to their indifference and neglect which allows the inferior who are not indifferent to gain the rule. We see this in what is called the short ballot, and particularly in what is known as the commission form of government of cities. A large number of cities, particularly in the West, and in the very sections which call for the rule of the people, are thus going away from the rule of the people and are putting the rule into the hands of the few competent. This does not constitute an aristocratic form of government, for the people choose their rulers, but it approaches toward an aristocracy, just as the other popular tide turns toward a democracy.

What we wish to impress is the fact that when we trust the people, and trust them more and more, we do not hide the fact from ourselves that a multitude of

our voting rulers are not fit to rule, that they rule as a privilege, and that if they were in a controlling majority our condition would be as bad as it is just now in Cuba or Mexico; and that we believe we can trust the people because we believe that a comfortable majority of them are, in most places, fit to be trusted and will attend to their duty of ruling.

A Peculiar Grace

No one of the graces of character seems more specially Christian than that which our Lord illustrated when he told his disciples, "I am among you as one that serveth." In many ways did he enforce this self-abnegation, which is more than humility, which is the opposite of ostentation, whose characteristic it is that it is utterly heedless of personal glory and wide fame if it can only do service for others. Jesus taught it by parable, precept and example. He washed his disciples' feet to illustrate it; he told them to take the lowest seat and not the highest at a feast; and when James and John, "sons of thunder," wished to sit at his right hand and his left in his glory, their ambition was sharply rebuked. But chiefly he taught the lesson in his whole life on earth, when he made himself of no reputation, took on himself the form of a servant, and humbled himself to the death of the cross. Splendidly has Milton, in his incomparable picture of the high council chamber of Heaven, put the story of our Lord's prospective humiliation into the words of the Father:

"Because thou hast, tho throned in highest bliss,

Equal to God, and equally enjoying

Godlike fruition, quitted all to save

A world from utter loss, and hast been found
By merit more than birthright Son of God.

Found worthiest to be such by being good

Far more than great or high; because in thee

Love hath abounded more than glory abounds,
Therefore thy humiliation shall exalt

With thee thy manhood also to this throne."

If ambition of high place is "the last infirmity of noble mind," the avoidance of self-display, the readiness to let others have the show if one can only do the work, is a peculiarly Christian grace.

Two striking illustrations of this grace and of its reverse have come to public view in the last few weeks. One

of these is the case of a distinguished and highly honored ecclesiastical dignitary. He had just received the highest prize but one in the gift of the largest branch of the Christian Church. He had returned from the official center of the Christian world to receive all the glory and grandeur which his loyal associates could heap upon him, and he had entered again on the ordinary routine of his duties. Among them came the duty to attend a public function. The Governor of the State was invited, and was to sit at the feast next to the presiding officer. But this chief ecclesiastic and example of his flock demanded that he should have the first seat, before that of the Governor; it was not consistent with his dignity that he should take a lower seat. He required the higher one and he took it, crowding out the chief civil magistrate of the commonwealth. We suppose he demanded it, he would say, not for himself, but for his office, which was higher than a civil office. And yet was it higher than that of Him who said, "Ye call Me Master and Lord, and ye do well, for so I am. If I, then, the Lord and Master have washed your feet, ye also ought to wash one another's feet. If ye know these things, blessed are ye if ye do them." We wish the churchman had been willing to sit below the humblest at that table, as his Master would have been.

For the other illustration of the grace exhibited we have to go, strangely enough, to the opposite side of the globe and to one of a race not like ours. A yellow wanderer over the earth, unknown to the world, by his secret but persistent and passionate efforts to give liberty to his people, had achieved the impossible, to the amazement of the nations, and was unanimously chosen President of the Chinese Republic, which he had created. It was the highest honor on earth, to be the founder and head of the reorganized government of the mightiest nation on the face of the globe. There was an ambition not sought, but to be valued and held. But he refused to hold it. He said that another man was better fitted by training and experience to be President of four hundred million full citizens, and Sun Yat-sen withdrew, resigned, and asked

the new Parliament to put Yuan Shih-kai in his place. All human history has not an example of more remarkable self-abnegation. It was sublimely Christian, altho this Chinese physician had no ecclesiastical honor, but had simply learned the lesson of the Master. Higher than Yuan do we put him. He will be remembered in song and tale and myth when the American ecclesiastic sleeps in oblivion. He forgot himself. He that humbleth himself shall be exalted. Having, as far as man may, followed Him who humbled Himself, he will follow in his human measure the exaltation of Him to whom, at "Heaven's high council chamber," the Voice from the midst of the throne continued:

"All power
I give thee; reign forever and assume
Thy merits; under thee, as Head Supreme,
Thrones, Princedoms, Powers, Dominions I
reduce:
All knees to thee shall bend of them that bide
In Heaven, or Earth, or under Earth, in Hell."

Observations on Animals

THE report of the English Royal Commission on Vivisection brings this much discussed subject once more into popular view. Terms often mean so much in discussions that it is important to choose them properly or they may contain innuendos or carry connotations quite beyond their significance. Vivisection is a designation that carries with it many hints at least of cruelty, prolonged suffering and painful death. This is of course the reason why it is chosen and maintained as the slogan of those opposed to animal experimentation. After all, vivisection, that is, the cutting of a living creature, has no right to have serious hints of cruelty go with it, for with the best of intentions, in true kindness of heart and for the saving of suffering, human beings have to be *sectioned*, that is, cut, and sometimes to a serious extent, every day. The greatest advance in modern medicine has come in surgery, that is, the vivisection of human beings. It is indeed to lessen the necessity for the vivisection of human beings as far as possible that animal experimentation, vivisection so called, is practised.

The term, however, has been taken to have quite another meaning and it carries with it quite unjustified innuendoes. Of course, this same thing is true for many other terms in popular use. The "dog days" in the summer time are popularly supposed to be days during which dogs go mad much more frequently than at other times in the year. As a matter of fact, the term "dog days" has nothing whatever to do with dogs, for these are the days of the dog star, the *dies canis* of the Romans, when Sirius or Canis, the dog star of the Romans, rises with the sun. Because of this misunderstanding many a poor dog during the hot weather is made to suffer torture for a drink, because if his tongue hangs out of his mouth people are afraid of him; it is the *dog days* and he may go mad, tho rabies is much more common in February and March than it is in July and August.

Vivisection is the term that unfortunately has come to mean the employment of animals for experimental purposes in order to determine whether certain drugs and operations can be employed with safety on human beings and whether certain theories in physiology and biology that seem to have hopeful aspects for the understanding and treatment of human diseases are exemplified in physiological and biological processes as these may be studied in animals. The trials must be made either on animals or man if medicine is to advance. It is now nearly six years ago since the English Parliament, moved by the clamor against animal experimentation, appointed a royal commission to inquire into vivisection. This commission consisted of ten members empowered to take evidence on the subject, and they held sittings for nearly two years. The report is now presented, its previous presentation having been delayed by the death of two commissioners and the illness of others.

There are many persons who are doubtful as to the position they should hold with regard to animal experimentation. They realize that they know very little about the subject, but they are being swayed by friends for or against, and especially against, for it always seems easy to have a propaganda against

things. If they want the judgment of a royal commission of highly intelligent men it is now available. Their conclusions leave no doubt in the matter. They say:

"We have received evidence from persons eminent in physiological, pathological and sanitary science who have testified to their belief that knowledge has been acquired in regard to the vital functions, the causes of diseases and also in regard to means for their prevention and cure which in their opinion but for such experiments could not have been acquired."

They emphasize in the second paragraph of their conclusions a very important fact in this matter:

"We have, on the other hand, heard many witnesses, some of them having medical qualifications, who have disputed that valuable knowledge has been obtained by such experiments, maintaining that this knowledge has been erroneously attributed to such experiments, or who have contended that success has not attended the application of the knowledge to the preventive or curative treatment of disease."

Here is the crux of the whole discussion. On one side we have the medical scientists of the world, who have brought about a reduction in the death rate that has added many years to human life in the last generation, who insist that their greatest help in this campaign for better health has been animal experimentation. On the other side we have a few physicians, of no prominence as a rule, and rarely of any scientific standing, who indeed obtain their notoriety in the community by opposing their brother physicians and who, besides opposition to animal experimentation, are usually found to be disbelievers in vaccination, in serum therapy and diagnosis, and in all the modern advance of medicine. Most of them harbor a number of queer notions besides their antivivisection.

No wonder the commission has said, then, with judicial decision:

"Having regard to the witnesses who have appeared before us and to the evidence which we have received there can be no doubt that the great preponderance of medical and scientific authority is against the opponents of vivisection."

And then there is this interesting final sentence:

"This [the great preponderance of medical and scientific authority in favor of animal experimentation] is more marked now than it

was at the time of the royal commission [on vivisection] of 1875."

They declare then:

1. Valuable knowledge has been acquired in regard to physiological processes and the causation of disease, and that useful methods for the prevention, cure and treatment of certain diseases have resulted from experimental investigations upon living animals.

2. As far as they can judge it is highly improbable that, without experiments made on animals, mankind would at the present time have been in possession of such knowledge.

3. There is ground for believing that similar methods of investigation, if pursued in the future, will be attended with similar results.

There are men, even physicians, who will cling to their opinion of opposition, who will insist on being different from the majority, an intelligent majority, "extreme examples," as has been so well said, "of that cheap and despicable paradox which thinks to escape the charge of blind docility by the affectation of heterodox independence," but a high court, with all the evidence fairly before it, has spoken. The case is closed for those who follow reasonable authority where they cannot hope to have and weigh all the evidence for themselves.

The Single Tax for China

WE might expect anything in China. The ancient empire which has so suddenly become a republic need not surprise us if she were to do more radical things than Mr. Roosevelt has ever dared to propose. It would not surprise us much if the new government should ask the people in a mass to accept Christianity even. But we admit that it had not occurred to us that so tremendous an experiment should be planned as the adoption of Henry George's theory of taxation. To accept Christianity would be mostly a form and would not hurt the pocket. But to put the taxes on land, all the taxes, would touch almost everybody in a land of farmers. It would be an experiment tried on a tremendous scale, and, we fear, where it would excite great opposition. And yet it is declared that

this is the proposition of Dr. Sun Yat-sen, and his influence is immense.

Now what is this single tax system that bears the name of Henry George?

In a few words it is this. He would take off all other taxes, and put all taxes on land; not on manufactures, not on any form of personal property, not on houses and other buildings even, but on the bare land, the farm land, the city land, and especially the unoccupied land whether in city or country, the land held for the unearned increment that follows a rise in value.

But why tax property in land and tax no other property? Is it fair to tax the man who owns a farm and lives on it, and not tax a mechanic or merchant or speculator who owns no land and who may be much richer than the farmer? Why such apparent injustice?

In the first place, because the land is always in sight. Nobody can hide it. Next, and most important, every other value depends on land. Everybody lives on the land and off the land. A tax on land distributes itself over the whole community. The farmer sells his crops, and he has to put the tax on those who buy his produce. They buy it at the enhanced price. So the man who rents a house finds the tax charged in his rent. He pays no tax in cash to the tax collector, but he pays it to the owner of the land, who does pay it over to the collector of taxes. A tax on land, says Mr. George, has the faculty, like water, of seeking a level. No man whatever can escape the tax, even if he thinks he is paying a tradesman or a milkman. The land tax is spread over the whole community.

But Henry George put especial credit on this proposition, because he believed that it would put an end to speculation in land. Land would not be held unimproved for a rise, in city or country, if all other taxes were lumped on the bare land. A man could not afford to hold land that paid him no income if it were heavily taxed. Here is a lot in a city that holds a big thirty-story business house, and next to it is a vacant lot, and both pay the same tax, for the tax is only on land. The owner would have to improve his property or sell it to some one who would. Equally unimproved

country land would have to be put in cultivation. The result would be the reduction of swollen fortunes from speculation, and the distribution of population invited to occupy and improve vacant land.

The plan is a very alluring one, and we cannot see that it would not work. No tax is impartial, and we do not see that if the tax were put exclusively on land it would not distribute itself over the whole community.

But we fear it would not easily be accepted by a farming people like the Chinese. It would *seem* as if it were unfair to make the farmers pay all the taxes. We know that in India the land tax is the most unpopular of all taxes. The farmers of India or China have very little money. They would have to pay, many of them, in kind, as they do now in Turkey. The tax gatherer would be an object of dread. Very likely the collections, if not in kind, where very little money is in circulation and it could not be hoarded up, would have to be made quarterly. We can imagine that the nation would rise in indignation against it as unfair and uncollectable.

But we cannot believe that the taxes on imports will be given up. That has been now for years, under Sir Robert Hart, an honest British official, the easiest and the most convenient of all taxes. The people are used to it. To be sure, the internal octroi taxes will be given up, but we can hardly suppose that while Japan has its import duties and every other tax it can invent, China will give up the easiest and cheapest and most satisfactory of all its taxes.

And further, when the novel single tax is adopted we may expect that the new republic will accept other reforms. It will take possession of all natural monopolies. It will own the railroads and telegraphs and telephones, as well as common highways and canals and mines. All these will bring in a handsome profit to the government, and supplement the land tax and the product of the tariff.

It is not at all unlikely that China will become a disciple of Henry George, giving him a fruit of his speculations which he could never have thought of, but which rejoices the heart of his son, who is a member of Congress from Manhattan. He is acquainted with Dr. Sun.

He remembers how much Dr. Sun was interested in his father's theory of taxation; and he reminds us that one of our American missionaries translated into Chinese a considerable part of Henry George's "Progress and Poverty," and that it has had a large circulation among Chinese students. We are quite willing to have the theory put into practice in China, a country which may be destined to be the most progressive as it has been the most conservative of all nations.

Child Labor Reform

IT was a sane position, taken by one of the speakers at the recent Child Labor Conference, that children always had worked, always would work, always must work, and it was good for them to work. Unfortunately, reforming becomes a profession, and many reformers lose their sanity. Froebel ought to have prepared us by this time to understand that work and play are substantially one, and that a child old enough to play is old enough to work. It has always been a provision of Nature that the hands should keep pace with the brain, and that hand culture should be closely identified with brain culture. Nothing can occur more unfortunate than a failure to train the hands to helpfulness; that is, to express a desire to share the burdens of others.

The juvenile court was an inspiration, and its formulator fortunately was a sane man. He set on foot salvation for thousands of young people. He has, however, promulgated no idea that young offenders can be weaned of criminality by baseball and moving picture shows. What our young people need is work, and plenty of it. They need not be overworked, nor need they be shut in from the sunshine of life; but any proposition that eliminates boys and girls from the bread-winning forces, or makes them simply a social burden, is a blunder.

We are willing to go nearly as far as one of our contemporaries in charging the high cost of living to the fact "that children in well-to-do families are not trained up to help as systematically and thoroly as they were formerly." He is right that the cost of living is greatly

enhanced when children are no longer willing to assist in the essential work of the family, and when the parents are willing to take upon themselves the responsibility. The cost of living depends upon the amount of hired help that is necessary. It is no excuse for this state of affairs when we are told that the children must be sent to school. We wait with considerable impatience the slow change that is going on, from educating our children away from the farm and the kitchen to a home and school education that will specifically fit them for making home life comfortable for the whole family as well as for themselves.

Every child should be a social help and family help, and should be trained for that purpose definitely, to take his place in the working world. Trained to work does not mean trained away from education. Indeed, education has for its prime end to enable the young to use facts. What we want is glorification of labor, until we entirely slough off the son who will put his parents under a mortgage to pay for his college luxuries, and the daughter who will serve as a show, and be contented as such, while her mother wears out with undue toil.

We are well aware that we are not covering the whole subject. The factory has surely taken small children and set them to merciless tasks. Law does righteously to regulate this matter. But those who shoulder the reform should, above all, avoid promulgating the idea that even small children should not be taught to do their share in the family. So long as poverty is as widespread and deep as it still is, the poorest families will not lead an ideal life. The children as well as the adults will come in for their share of the consequences, the pinching and the suffering. Relieve it all that we can, but at no point should we teach that human life can be made up of frolic and play. School itself must mean work, not play; both brain work and hand work.

The great problem is not play-yards, but workshops; not how to amuse the young, but how to use them; and how to so organize labor that it shall become the great glory of human life, of child-

hood and of youth as well as of adult life. The saddest feature and the least hopeful in our large cities is the condition of those young people who are entirely out of the industrial sphere, with nothing to teach them steadfastness of will and self-support, floating about without purpose, and so far as their future usefulness is concerned, without hope—a vast mass of human beings, without real training to fill their places in society, and do their share of the world's work.

Can we not, by united effort, make fruit-growing as attractive as football, and homekeeping as attractive as bridge and tennis? We certainly cannot do this until we recognize that there is nothing in work itself that should be despised or dreaded. What the world needs just now is wise hands, and brains wise to direct the hands. We believe in legislation and agitation to prevent the dwarfing of children intellectually and physically in the factories; we believe just as strongly in agitation and legislation to prevent the dwarfing of children intellectually and physically in our schools. All along the line where there is abnormal wealth and where there is painful poverty the only cure is wisely directed work.

Mr. Roosevelt and His Party

The first stages of the national campaign, on the Republican side, have been of a remarkable character. In the past, as a rule, men publicly seeking a Presidential nomination have commended and supported the policy of their party, while criticising or denouncing the policy and record of their partisan opponents. This year we see the Republican who was President for seven years, and who, at the time of his retirement from office, was regarded as the party's greatest man, seeking an nomination by attacking his party, its leaders, and its record during the last three and a half years. Mr. Roosevelt's denunciation of the President goes far beyond that officer; it strikes the organization in Congress and out of it. He also attacks the record which the party must commend in its platform. He would have Mr. Taft characterized in that platform as a reactionary who has and deserves

the support of unscrupulous bosses and dishonest legislators. He asserts that the party leaders in several States have recently been guilty of deliberate and premeditated fraud, that their action has been "infamous." He openly makes war against almost all whom the party has chosen to represent it and act for it, beginning at the top, with the President, whom he so warmly praised four years ago, when he promoted or procured Mr. Taft's nomination. And he asks the party to take himself now for its standard bearer. Candidates for the nomination on the Democratic side are taking the usual course. They are not publicly denouncing each other, but are harmoniously supporting their party's policy and opposing the common enemy. Governor Harmon is denounced by Mr. Bryan, it is true, but Mr. Bryan is not a candidate. Mr. Roosevelt must know that he is continually giving the Democrats ammunition. They could ask for nothing more serviceable than his public testimony against his party, the leaders of it and the record of the Republican Administration. Mr. Roosevelt knows, of course, that he will not be nominated. He must also know that his action and utterances have not tended to promote Republican success at the polls. Success there would not have been assured by harmony in the party. Those who hoped for it are not encouraged by the harsh discord which he has introduced.

Mr. Roosevelt
and Mr. Lincoln

It is not easy to see the parallel that Mr. Roosevelt makes between himself and President Lincoln. To be sure, Mr. Lincoln criticised a decision of the Supreme Court of his day; or, rather an *obiter dictum* of Chief Justice Taney that under the Constitution a negro had no rights which a white man was bound to respect. But we have always felt free to criticise decisions of the Supreme Court or other courts, President Taft does not hold them immune from criticism. Just now he is complaining of a decision, and asking that there be a rehearing. If criticism is insurgency then President Taft is an insurgent equally with Mr. Roosevelt. But be it understood that Mr. Lincoln's great debate of 1858 was not against the Supreme Court,

but over an utterly different question which was entirely legislative, not judicial, whether slavery should be admitted into certain new States under the Missouri Compromise. Accordingly he severely attacked slavery, and if he criticised Chief Justice Taney it was only incidentally. Of course, slavery was in the Constitution, even the slave trade permitted till 1808, and the return of fugitive slaves provided for. Neither Lincoln nor anybody else attacked the courts for protecting slavery under the Constitution, but they attacked the Constitution, and when they reached a majority they corrected the Constitution, but stood by the courts. That is what we would do now, enact stringent laws which restrain and punish what is called "predatory wealth" wherever it appears; and, if the Constitution stands in the way of such legislation, then amend the Constitution. That was Lincoln's way.

Socialist Defeat
in Milwaukee

Too much must not be made of the defeat of the Socialists in the mayoralty election in Milwaukee. Of course they were defeated. They were not in a majority in the election which gave a Socialist mayor, for he was elected by a plurality which was a good deal less than a majority. This time the other parties united against the Socialists and swept the field by a majority of 12,824. But this was no very serious defeat for Socialism; for against that party all the old parties combined, and the vote of 30,200 for the Social Democrats against 43,064 for the coalition was itself meaningfully large. They never cast so many votes before. In 1906 they polled 16,837 votes; 20,887 votes in 1908; 27,608 in 1910; and now 30,200 in 1912. Here was a steady gain. On the other side, the combined vote of the two opposing parties showed no such steady gain. In 1906 they cast 44,182 votes; 41,517 in 1908; 31,876 in 1910, and now 43,064 in 1912; less than they cast in 1906, altho the registration in the meantime had risen from 76,650 to 90,592. It is further to be noticed that the condemnation of Socialism by the Catholic Church has had little or no effect, for the Socialist vote has been chiefly from the

laboring class, which is predominantly Catholic. They do not propose, any more than the people of Ireland, to get their politics from Rome. Socialism in Milwaukee is not crushed by this defeat. Only an extraordinarily good municipal government under Mayor Bading, and the maintenance of the non-partisan coalition, can keep the Social Democrats out of power in 1914.

Honors to Cardinals We have exprest an amused surprise at the absurd claim by the "Marquise de Fontenoy" in his (or her) discussion of so important a matter as ceremonial precedence, that Cardinals, as "princes of the blood," must stand at the top of the procession; but we should not have expected to see this claim presented here in this country by any of our American Cardinals. To our surprise we see the substance of the long article printed conspicuously in *The Pilot*, the organ owned by the Cardinal Archbishop of Boston, and from it we quote the following passage:

"Even tho Cardinals Farley, O'Connell and Gibbons are at heart patriotic Americans and members of an American hierarchy, yet they are as Cardinals foreign princes of the blood, to whom the United States, as one of the great Powers of the world, is under obligation to concede the same honors that they receive abroad.

"Thus, were Cardinal Farley to visit an American man-of-war he would be entitled to the salutes and to the naval honors reserved for a foreign royal personage, and at any official entertainments at Washington, the Cardinal will outrank not merely every Cabinet officer, the Speaker of the House and the Vice-President, but also the Foreign Ambassadors, coming immediately next to the Chief Magistrate himself."

We laughed at this when we read it in the dailies, but we are amazed when we see it presented in the Cardinal's own organ.

Irish Home Rule Now that the outline is published of the Irish Home Rule bill, it is evident how little its opponents have to fear from its passage. All the evils they have foretold are carefully avoided. The Irish Parliament will have no authority over imperial affairs, such as army, navy, treaties and coinage. It cannot meddle with religion by favoring

one over another in the public schools or otherwise; nor can it give other privileges or impose disabilities because of parentage or place of business. Ireland will lose twenty members of the imperial Parliament. The Lord-Lieutenant will have the power of veto of Irish laws, and the imperial Parliament can repeal an unjust tax. What strikes us in this country as most anomalous is that after six years Ireland will have power over the tariff, but retaining free trade with England. This will be for the purpose of giving a revenue and will be in agreement with the government of Canada. Canada, however, with the right of imposing duties, has no right to representation in Parliament; and it may be expected, and perhaps is anticipated, that Canada, Australia and South Africa will seek and demand later their own representation in Westminster. Doubtless the Ulsterian hysteria will continue, but Ulster will have to submit to what is a very reasonable demand for self-government.

Dickens Once More "There must be something wrong with me," confesses one Englishman:

"I can never get a thrill by saying: 'Exactly a hundred years ago Charles Dickens was born.' Sometimes I try saying it another way, 'Just fancy! A hundred years ago Charles Dickens wasn't even alive.' Still it conveys nothing to me. . . . To have been born a hundred years ago is hardly a triumph; thousands did it."

We are with Mr. Milne here. The centenary has at least one unfortunate feature, it stimulates, as a rule, the turning out of a great many exaggerated, not to say hectic, "appreciations." But this Dickens centenary has given New Yorkers the opportunity to see a dramatization of one of Dickens's best known novels staged in a truly royal fashion, the "Oliver Twist" in which Mr. Goodwin, Miss Doro, and an uncommonly well rounded cast are playing to full houses. Perhaps the play is not one to make the children sleep the better for seeing, but children should only attend matinées anyway. And how the boy Charles Dickens—enthusiastic gallery god that he was—would have clapped the melodrama!

Christianity in India

Once in ten years there is taken a religious census of the 315,000,000 inhabitants of India. That of 1911, just published, shows an increase in the number of Christians much more rapid than of the general population. In 1901 the Christians numbered 2,923,000, and in 1911, 3,870,000, nearly a million more. In order to discover the result of missionary work we must deduct about 200,000 of European descent, including soldiers, which gives us 3,670,000 natives. Of these 101,000 are Eurasians, and of these 57,000, a little more than half, Roman Catholics. Of the native Christians not Eurasians, there are about 3,574,000, and of these the Roman Catholics number 1,396,000, as against 1,122,000 ten years ago, which is a surprisingly small increase. Of the various Syrian churches there are nearly three-quarters of a million, a handsome increase over the 571,000 of the previous enumeration. But here the chief growth has been in the Romo-Syrian branch (which we take it is really Roman Catholic) by nearly 90,000, giving them 413,000 adherents. The native Protestants count 1,442,000, an increase of almost one-half since 1901, when the total number given was 970,000. The number of Baptists has increased in ten years from 217,000 to 331,000, mostly in Burma and Assam; the Anglicans from 306,000 to 332,000; the Congregationalists from 37,000 to 134,000; the Presbyterians from 43,000 to 164,000; the Methodists from 68,000 to 162,000; the Lutherans from 154,000 to 217,000; and the Salvationists from about 17,000 to 52,000. It would seem that the rate of increase in the Protestant native community is quite as rapid as it has been in previous decades, when it has been a little less than one-half; and this growth is due wholly to the successful work of European and American missions.

Thomas Jefferson, no less than any living statesman, stood for justice. We read in Mr. Morse's biography that one of Jefferson's animosities was directed at the Federalist judges. In the course of his first term he sent a special message to the House of Representatives concerning the shortcomings and eccentricities of Pickering, of New Hampshire, a

judge of the district court, who ended his days as a victim of insanity. Pickering was impeached before the Senate, was found guilty, and removed. Jefferson was a radical in his own day; he would seem a radical were he living his life over again today. If he did not urge the recall of judges and judicial decisions, perhaps that is because he was too much the democratic statesman—insufficiently (in spite of his part in the attack upon Judge Chase) a demagog.

It would be charity to hold that it is what the Apostle calls "godly sorrow" that has led Abraham Ruef, the former boss of San Francisco, and now a convict, to make what he declares will be a full confession of the bribery and graft by which he ruled the city. He is stung by the attack upon him in a paper, and he has begun what will be a long story and will expose the magnates of finance to whom the city was sold. It may send some of them to prison, but the question will be hard at times to answer, whether these big corporations tempted Ruef or whether he and his gang held up the business men. Doubtless both conspired, now one and now the other. Such a confession illustrates the difficulties of concealment, and so fear will be a force for civic honesty.

The daily journals have called attention to the fact that the late Lord Lister, the father of modern operative surgery, forbade by his will that any of the large bequests made by him to the public should be called by his name; but they have given less notice to the fact that it is because of his known wish that he is not buried in Westminster Abbey. This latter distinction is one that should be bestowed by public acclaim, and we regret that his desire is respected, for no soldier deserves the honor more. While no blame is to be put on those who desire their name perpetuated, we yet admire the man who does service and avoids fame.

Another development of the pension plan, which our Congress still refuses to give to our civil servants, is to be seen in the decision by the University of Chicago to set aside over \$2,000,000 of its endowment to pension its professors who

have reached the age of sixty-five and have served for not less than fifteen years. Because the University of Chicago has a provision in its charter giving Baptists a certain preference in its board, it cannot receive advantage from the Carnegie Foundation; but the last gift of \$10,000,000 from Mr. Rockefeller allows it to do its own pensioning.

Congress is to be congratulated in having passed by practically unanimous vote the phosphorus match bill of the American Association for Labor Legislation. Henceforth the importation and exportation of poisonous phosphorus matches will not be permitted, and a prohibitive internal revenue tax will be imposed on their manufacture within the United States. Thus "phossy jaw," the most loathsome of all industrial diseases, is abolished.

On the side of the workmen in the recent coal mine strike in Great Britain the most notable fact is that there was almost no violence. The miners avoided all rioting and behaved as peaceable citizens. And yet it was the most powerful strike yet known, and it frightened the whole Empire. That is an example for this country, where a strike is hardly begun before there is violence. This shows that rioting is unnecessary and does more hurt to the cause than good.

We have spoken of the danger that the starling will become a nuisance in this country, such as is the English sparrow. It has no friends abroad, notwithstanding Sterne's sympathetic account in his "Sentimental Journey" of the caged starling that kept repeating "I can't get out." We see in an English paper the mention of a man who shot with one barrel at a flock of starlings on the ground and then fired the other barrel as they rose. He killed fifty birds. We already have considerable flocks of them about the orchards and gardens of this neighborhood.

A league of Republican clubs in this State, composed of colored voters, has adopted a resolution objecting to the use of the word *negro* as applied to the members of the race as humiliating. The word is decent in itself, and one not to

be resented, and means simply black; the one fair objection to it is that in the North most of them have as much white blood as black, and may more properly be called *colored*, but the word includes Hindus, Chinese and Indians.

We trust our readers will excuse us if we have given no space to the name or the appeals for release from prison of a contemptible house-servant discharged for insult, and who was convicted of burglary, guilty of assault, and who has sought pardon by defaming a lady. And yet the case has filled pages day after day of the daily papers.

It is the merit of Christianity that it has initiative, and other religions must follow. The latest example appears in the decision of the Buddhists of Japan to undertake the establishment of a woman's college, such as the Christians set the example of; and this is being promoted by a Women's Buddhist Association, which is patterned on the Y. W. C. A.

It is not surprising that Kaiser William should have told Colonel Goethals that the Panama Canal ought to be fortified and heavily garrisoned. He would put soldiers everywhere he could. We would keep them out of every place possible. We would not have our children know what a soldier looks like.

One of the important acts to be done at the Methodist General Conference next month is to remove from the Discipline the prohibition against dancing and theaters, which may be very innocent amusements. The rule is obsolete, and to amend it is more important than the election of bishops.

We welcome the 2,600 dwarf flowering cherry trees sent by the Mayor of Tokyo to this city. This time they have been disinfected and will bring beauty to the grounds about Grant's Tomb. It is a very graceful gift.

The British budget shows a surplus the last year of \$32,725,000, but it is not used to reduce the debt, but is put aside to pay for new ships of war if Germany decides to make fresh additions to her navy. So war blasts in time of peace.

Money Trust Inquiry

A SUB-COMMITTEE of the House Committee on Banking and Currency will begin this week to hear testimony in the inquiry as to the existence of a Money Trust. This action follows the demise of the National Monetary Commission, which, on the 31st ult., quietly ceased to exist. The purpose of the sub-committee is to ascertain, at the beginning, to what extent the banks and trust companies of the country are involved in a network of interlocking directorates, and the relation between them and the large industrial corporations. It will seek information from more than 3,000 banks, but the first stage of its inquiry will relate to the banking institutions of New York. The first witness, it is said, will be Frank A. Vanderlip, president of the largest bank (the National City) and formerly an Assistant Secretary of the Treasury. An investigation of this kind, if conducted by sane and competent men seeking a basis for good legislation, will serve the public interest. The inquiry should not be made in a spirit of hostility to banking institutions. It should not be made for partisan purposes, nor should the aim of the investigators be to support a preconceived theory that a wicked combination exists by means of which a few men rule and rob the people. Their aim should be to procure the facts and opinions which can be used in framing legislation for the promotion of that banking and currency reform which is so greatly needed. In their work, the information accumulated by the Monetary Commission, as well as that commission's recommendations, should be considered without prejudice.

Arbitration in Business

IN March of last year the New York Chamber of Commerce elected members of a committee on arbitration, and in June these members were sworn in by a Justice of the State's Supreme Court. This attempt to substitute inexpensive and speedy arbitration for expensive and protracted litigation, in such contro-

versies between persons or corporations engaged in business as relate to questions of fact rather than to those of law, has attracted much attention here and abroad, and several other similar organizations now intend to establish such committees. The first annual report of the Chamber's committee was submitted last week. Much of the committee's time during this first year was consumed in a campaign of publicity, in order that business men might know what the committee was ready to do. But in the work for which it was created a good beginning was made. The report says:

"In addition to this necessary work of publicity and preparation, the committee has had the satisfaction of assisting in the settlement of a number of important differences, altho in most of these its work was that of conciliation rather than of arbitration. In other words, the committee has been instrumental in bringing contending parties into a state of mind that enabled them to settle their differences without a formal submission to an arbitrator. Twenty-two disputes have been brought to the attention of the committee, fifteen of which have resulted in friendly settlements, 'out of court,' while seven are still under discussion. One of the cases settled was a difference between two of the biggest houses in the city. After an arbitration had been agreed upon and a time set for a hearing, the two parties were able to settle their dispute privately. It is probable that but for the committee's friendly offices, this case would have resulted in litigation."

The first arbitration took place in February of this year, and it was an exceptionally interesting case, because neither of the disputants was a member of the Chamber of Commerce, and one of them was an English firm. In this international controversy a decision was reached in about thirty days, at a cost of less than \$60. We are confident that much good work will be done by the committee in its second year.

.... The world's output of cane and beet sugar last year was 16,418,800 tons, against 14,524,450 in the year preceding.

.... A pension plan for the employees of the Western Union Telegraph Company has been completed, and it will go into effect in July next. The minimum allowance will be \$25 per month.

Federal Investigation of Fire Insurance

FIRE insurance as conducted in the United States has been assailed from many quarters and charged with innumerable shortcomings of both a positive and negative character, but until very recently it was not suspected of being the probable cause of our disgracefully large annual fire waste and the consequent death of thousands of citizens. Representative Jackson, of Kansas (at one time Attorney-General of the State), has introduced a resolution in the lower house of Congress directing that the Department of Commerce and Labor make an investigation of the fire insurance companies of the United States, inquiring into "the rates charged for fire insurance; the means and classifications employed in fixing the same, the reasonableness thereof, and the effect, if any, in causing" the enormous fire loss (which Mr. Jackson estimates at \$427,000,000), and the deaths of six thousand people.

These are staggering figures and they will be heard with amazement by those who actually know something of the subject. Statisticians have gravely lamented the annual average of \$250,000,000 fire waste during late years, and they will naturally lose hope when they learn on such high authority that it is nearly twice what they think it is.

As will be seen by the sense of the resolution, its author appears to believe that in some mysterious way there is a connection between this enormous waste of the nation's resources and the manner in which the fire insurance companies make their premium rates and otherwise conduct their business. Just what the relation is between the two is difficult to conceive, and doubtless underwriters will await with deep interest Mr. Jackson's exposition of the matter when he talks to the question on the floor of the House.

Another feature of this proposition which will grip the attention of those versed in the matter is that of the juris-

diction of a Federal Department over local corporations engaged in a business which has been specifically declared by the Supreme Court to be exempt from the interstate commerce provisions of the Constitution. It is presumed that, as Mr. Jackson has filled the office of Attorney-General of a State, he has some acquaintance with the case of *Paul vs. Virginia*. Congress has power to order the investigation and the Department of Commerce and Labor may proceed to make it, but it is clear that if the companies should be inclined to resist such an inquisition, they would be clearly within their rights. There have been several investigations of the fire companies within the past three years, two of them notable—those undertaken by legislative committees of New York and Illinois—and it does not seem that another is of particular importance, or that it would yield results of any more value. A national commission to inquire into our tremendous fire waste and suggest remedies would be of vastly greater benefit to the country.

FIELD men of the Prudential Insurance Company have organized the Dryden Memorial Association, the object of which is to erect, at a cost of \$15,000, a life size statue in bronze of the late John F. Dryden, the founder of the company. In order that as many employees of the company as possible may participate in the memorial, it has been decided that no contribution to the fund shall exceed one dollar.

THE Metropolitan issues a new form of industrial policy known as the "non-lapsable endowment." The policy is a single premium contract, and, being fully paid up, must remain in force to maturity unless its cash surrender features are taken advantage of.

A summary of the business done by foreign insurance companies in the United States during the last ten years shows an underwriting loss of \$11,919,311.

The Independent

VOL. LXXII NEW YORK, THURSDAY, APRIL 18, 1912

No. 3307

Survey of the World

National Politics At the end of last week there were still 398 Republican delegates to be elected. Claims made by the campaign managers differed widely, but a majority of the press tables gave Mr. Taft 346, Mr. Roosevelt 180, Mr. La Follette 36 and Mr. Cummins 4. The needed majority is 539. The President's friends were confident that he would have more than this number; some of Mr. Roosevelt's supporters said to the public that he would gain a majority. Many votes are affected by contests. There were surprises during the week. On the 9th the primary elections in Illinois were held. Mr. Roosevelt was successful, receiving about twice as many votes as were cast for Mr. Taft. The latest figures are: Roosevelt, 230,000; Taft, 119,000; La Follette, 37,000. At the same time 220,000 Democrats voted for Speaker Clark and 80,000 for Governor Wilson. Mr. Deneen was again nominated for Governor. Mr. Roosevelt has 56 of the State's 58 delegates. Senator Cullom was defeated for re-election, and Lawrence Y. Sherman was named by the voters to succeed him. It is admitted that on the Republican side the result was determined mainly by a revolt against Senator Lorimer and a disapproval of reciprocity. Mr. Taft was regarded by many as Lorimer's political friend. This victory in Illinois greatly encouraged the supporters of Mr. Roosevelt. On the 13th there were primary elections in Pennsylvania. A majority of the newspaper predictions were that Mr. Roosevelt would not have more than 20 of the State's 76 delegates. Mr. Taft's interests were in the hands of Senator Penrose. In the western part of the

State the leading advocate of Mr. Roosevelt's nomination was William Flinn, of Pittsburgh. But the President's friends were able to elect only about one-seventh of the delegates. As we write, the news is that he has only 11, while Mr. Roosevelt has 65, including the 12 delegates at large to be chosen by the State convention. His success in Illinois and Pennsylvania suggested talk about a "dark horse," and Justice Hughes was the only one mentioned. Mr. Taft's friends, however, said that he would not withdraw in favor of any one. They predicted his nomination on the first ballot, asserting that from the delegates still to be chosen his rival could not get enough to make a majority. "No one must dare suggest compromise to me," said Mr. Roosevelt. —Mr. La Follette is to make more than 100 speeches on the Pacific Coast. He has published a statement criticising Mr. Pinchot and others for deserting him and asserting that before Mr. Roosevelt was an avowed candidate they repeatedly urged him to permit a combination with the ex-President or to withdraw in the latter's favor. He refused, he says, to be a stalking horse for any one. —On the Democratic side Mr. Clark has been gaining. Governor Wilson has the Pennsylvania delegates. The Republicans of the New Jersey Legislature have published a statement criticising him for alleged neglect of duty, in relation to his recent vetoes of about forty bills, and he has replied sharply. Governor Harmon made several addresses last week in Nebraska, where he is vigorously opposed by Mr. Bryan. He answered several attacks upon himself and referred to a part of his work as Governor of Ohio. Mr.

Bryan in a published interview says it is not clear to him yet whether Mr. Clark or Governor Wilson is the candidate most deserving of support.

The New York Conventions ✱ At the New York Republican convention, held in Rochester, on the 9th and 10th, the delegates were not instructed, but they were urged in the platform adopted to vote for Mr. Taft, whose "patriotism, wisdom and undramatic courage" were at the same time "applauded." The address of the temporary chairman, President Butler, of Columbia University, was distinctly hostile to Mr. Roosevelt, altho he was not named. The platform stands for a "self-controlled representative democracy," the preservation of "national tradition" and the constitutional protection of citizens when "threatened by a temporary majority." It opposes, as subversive of our form of government, the initiative, the compulsory legislative referendum and the recall, either of public servants or judicial decisions, "or any device which impairs consistency and continuity in the expression of the popular will." The Sherman act should be supplemented, it says, by a definition of the offenses prohibited, and there should be a board to enforce the law. Standing for protection, it holds that the duties should cover the difference in production costs and should be adjusted upon facts ascertained by an impartial board. The Democrats are denounced for ignoring the reports of the tariff board after professing to favor inquiry by such a body. A national banking reserve association should be created, it adds, and all justiciable international controversies should be referred to an international court of justice. The four delegates at large are Senator Elihu Root, William Barnes, Jr., Speaker Edwin E. Merritt and William Berri.—The Democratic State Convention, in New York City, on the 11th, was harmonious and its work was done in less than three hours. The greater part of the platform adopted relates to the tariff, from the exactions of which, it is asserted, most of the evils in our public life spring. Mr. Taft and his party are accused of grossly deceiving

the people when "they secured power by promising revision," and then made a revision "which instead of reducing the schedules increased the tariff on over 600 articles used by the American consumer." An immediate downward revision is demanded, to "relieve the people from the burden of high prices which now oppress them." The four delegates at large are Governor John A. Dix, Senator O'Gorman, Alton B. Parker and Charles F. Murphy. No instructions as to Presidential candidates were given, but the entire State delegation will be bound by the unit rule, and it is conceded that the advice of Mr. Murphy, the Tammany leader, will have much weight.

By direction of the Committee **Congress** on Territories, Senator Smith has introduced a bill authorizing the Government to construct and equip 1,000 miles of railroad in Alaska, under the direction of five commissioners to be appointed by the President. —Newell Sanders, a prominent manufacturer of Chattanooga and chairman of the Tennessee Republican Committee, has been appointed Senator, to succeed the late Robert L. Taylor.—The Senate, by a vote of 47 to 6, has rejected the House's proposed reduction of the number of cavalry regiments from 15 to 10. —A favorable report to the House has been ordered, with respect to a bill introduced by Mr. Henry, requiring publicity for all expenditures for candidates seeking nomination for the offices of President or Vice-President. —The Supreme Court has refused to grant a rehearing in the mimeograph "patent monopoly" case, but bills are pending which are designed so to amend the laws that the recent decision will have no injurious effect.—A bill to incorporate the Rockefeller Foundation (to which John D. Rockefeller will donate \$20,000,000) is to be reported favorably. The original bill has been modified to meet the objections raised when incorporation was first considered.—Representative Lindbergh, annoyed by delay in the matter of the Money Trust inquiry, has sharply attacked members of the House Committee on Banking and Currency, and introduced a resolution re-

quiring every member of the House to submit within ten days a statement showing what stocks he owns and in what business he is interested.

Trusts In his annual report, Herbert Knox Smith, Commissioner of Corporations, says that the Federal Government must have a permanent administrative office or bureau for the supervision of interstate corporate business:

"Whatever shall be our ultimate policy, however, whether of preserving competition, of enforcing competition, or of direct governmental regulation of business operations, or whether, as is, perhaps, more likely, our policy will be a combination of these various principles; in any event such a permanent administrative system is a necessary part of it. That system must have broad powers of investigation, taking continuous cognizance of the operations of large industrial corporations. By publicity and supervision it will preserve competition and provide equal opportunity; by an expert knowledge of current business conditions it will display the working of competition, and the cases, if any, where this fails to be of benefit. It will always be in a position to furnish, thru its permanent force of trained specialists, the information needed for legislation or regulation. It will also have the knowledge and data that may be required properly to enforce competition and to carry out the intent of any decree of dissolution entered under the anti-trust law."

He finds in the disintegration of the Standard Oil and Tobacco trusts, by order of the court, an object lesson on the need of such a bureau, because, he says, the public interest requires that the resultant units of these corporations should be subject to constant inspection by Federal authority. His suggestions are not approved by officers of the Standard Oil Trust, one of whom says that the courts have full power; that the bureau could do no more than the courts can do; and that it would cause annoyance. "Investigators," he adds, "would be at our elbows whenever an irresponsible agitator started a rumor that we are doing something we ought not to do."—It is understood that an agreement has at last been reached by officers of the International Harvester Company and the Attorney-General, for a dissolution of the company, out of which, it is said, five or six competing corporations will be formed. The negotiations for a

dissolution by which a suit under the Sherman act could be avoided were begun nearly a year ago. It is said that the plan which has been approved provides for an absolute divorce of the main company from control of distribution and the retail business.—The Beef Trust defendants who were recently acquitted in Chicago had been indicted some months earlier in Hudson County, N. J., but efforts to procure their extradition to New Jersey for trial were unsuccessful. Another attempt to bring these defendants to Hudson County is now to be made. Papers in support of an application for a requisition have been submitted to the Governor of the State.—In Brooklyn, as the result of an investigation made by agents of the Department of Justice, three merchants have been indicted by a Federal grand jury for monopolizing the trade in charcoal there, in violation of the Sherman act.—A shoe machinery company in Canada has sued, in Boston, the United Shoe Machinery Company for \$2,000,000, under the Sherman act, alleging that it was driven out of the United States by the defendant corporation.—Senator Cummins, in the Senate, on the 13th, sharply criticised Attorney-General Wickersham and the Federal Circuit Court in New York on account of the form of dissolution ordered for the Tobacco company or Trust. He asserted that the monopoly grasp of the company had been strengthened by the court's decree. He was supporting his bill, which permits an appeal from this decree to the Supreme Court in the interest of the independent tobacco manufacturers.

Labor Questions At the conference, on the 10th, between the anthracite coal miners' committee and President Baer, the latter proposed that the controversy should be referred to the surviving members of the Anthracite Commission of 1902. This proposition was rejected, and then the questions at issue were referred to subcommittees of four each. These subcommittees began their work on the following day and it will be continued thru the greater part of the present week.

There is an expectation that an agreement will be reached.—Of the 25,700 locomotive engineers who demanded a wage increase from the Eastern railroads, 93 per cent. have voted for a strike. Their leader has asked the railroad managers for a conference, and there is to be one this week.—The Denver & Rio Grande road has granted an increase of 7 per cent. to its firemen.

The Panama Canal Prof. Emory C. Johnson, of the University of Pennsylvania, testifying before a committee of Congress last week, at the request of President Taft, estimated the running expenses of the canal at \$30,500,000 a year. This included \$4,000,000 for repairs and cost of operation, \$11,500,000 for interest on the capital invested, and \$15,000,000 for military and naval expenditures in the Zone. The annual income, he thought, would be about \$1,000,000.—It is announced that the Japanese Government will subsidize a line of steamships to ply between Yokohama and New York, by way of the canal. There will be a fleet of eleven ships.—M. Bunau-Varilla, formerly chief engineer of the canal, and afterward Panama's Minister to the United States, has sent to a committee of the House a statement contradicting a part of the testimony recently given concerning the secession of Panama.—It is officially denied that Panama contemplates a sale of Colon to the United States.—The captain of a steamship arriving at Mobile on the 10th reported that many persons had been killed on the 5th by a volcanic eruption from Chiriqui Peak, that he saw the eruption, and that refugees came to Bocas del Toro. All of this proved to be untrue.

Secretary Knox's Tour

Secretary Knox arrived in Havana on the 11th. According to the testimony of current reports, he was received with much formality and some lack of warmth, but an elaborate program of entertainments soon proved that he was cordially welcomed. In an address at an official dinner he urged the Cubans not to let their Government fall into the hands of those who would

exploit it for selfish purposes. Referring to the attitude of the United States toward countries south of our boundary, he said: "Our policies have been without a trace of sinister motive or design. We crave neither sovereignty nor territory. Our record with respect to Cuba is consistent and unblemished." The United States, he added, was the friend of Cuba, always ready to aid her people in preserving the liberty our people had helped them to gain. In the course of his response, Señor Sanguily, Secretary of State, said the Monroe Doctrine could never mean a harassing, illegal and humiliating suzerainty. At a grand ball given at the palace in honor of Mr. Knox there were a thousand invited guests. It is said that Señor Sanguily asked him to procure a reduction of the British, German and French war claims against Cuba, which amount to \$6,000,000. Mr. Knox sailed for home on the 13th, confirmed, it is said, in his support of the policy that the United States should help the countries visited by him to maintain stable governments and pay their debts.—The Conservative party in Cuba has nominated for the Presidency General Juan Mario Menocal, now Secretary of Justice. He is a graduate of Cornell University's School of Engineering. It is expected that the Liberal party will nominate Alfredo Zayas, now Vice-President.—Officers of our State Department testified last week before a Senate committee that the removal of the duty on raw sugar would probably cause abrogation of the agreement with Cuba for preferential tariff rates and affect to some extent our exports of \$60,000,000 a year to the island.

The Situation in Mexico

At the beginning of the present week the expected decisive battle in the vicinity of Torreon had not taken place. In the South, Zapata's bandit army captured the city of Jojutla, in Morelos, on the 9th, but was soon dislodged by the Government's forces after a battle in which 500 men were killed. In Sinaloa, the capital, Culiacan, surrendered to revolutionists, having paid 25,000 pesos to avoid bloodshed.—Owing to the killing of Albert Fountain, an American, by

Orozco, and the latter's insolence, our Government, on the 14th, sent emphatic warnings to Orozco and Madero, giving notice that American belligerents must not be murdered after capture. Fountain, whose home is in Las Cruces, N. M., had charge of a machine gun in Villa's Federal army at the battle of Parral, and was taken prisoner after the city surrendered. He was tried by court martial, sentenced to death and shot. Our consul at Chihuahua protested against the sentence and sought vainly to save the man's life. Orozco refused to recognize him as an officer of our Government. Madero is held responsible with Orozco for the offense. It is said that Madero will be required to try Orozco for murder if the rebel leader should fall into his hands. Complaint is made also about the treatment of C. E. Heberlein, an American held in prison by Orozco as a spy.—One of Orozco's agents in New York, Manuel Lujan, has published a long statement, characterizing Madero as a selfish visionary. He asserts that Madero has wasted or spent the funds turned over to him in the Treasury, has wrongfully paid a claim for 700,000 pesos submitted by his brother, and has planned to pay \$3,500,000 for land owned by his uncle and worth only half that sum. Madero has published a comprehensive denial, pointing to \$22,500,000 in the Treasury. Felix Diaz, nephew of the exiled President, now a resident of the capital, says he does not believe our Government thinks of intervention, which would cost the lives of 100,000 soldiers slain by bullets or tropical diseases, 100,000 more disabled by wounds, and more than \$1,000,000,000 in money. Madero, he adds, lacks ability and tact, is a dreamer, and has been guilty of a series of irreparable errors since he took office.—An agent who represented the American owners of the land at Magdalena Bay says he was in communication with a Japanese fishing expert, but that the latter could not buy because he was unable to get the fishing concession from Mexico. He reported this to our Government in August last. He was not negotiating with the Japanese Government or with a Japanese steamship company. It is said that a purchase by our Govern-

ment was suggested.—The Americans at the capital have made plans for occupying, in case of danger, a hotel and eleven adjoining houses, in which they have stored \$30,000 worth of provisions, medical and surgical supplies, and 1,000 rifles. Eight hundred of these Americans have had some experience in military service.

An Ocean Liner's Misadventure

The White Star liner "Titanic," the largest steamship in the water, struck an iceberg off the Newfoundland Banks on her maiden voyage to New York. Reports of her crippled condition reached New York Sunday night. Fortunately the sea was calm and no loss of life was anticipated. The crash occurred at about half past ten on the evening of April 14. The wireless was used to report the accident to the shore and to call for assistance from sister steamers, five of which responded. First reports announced that the great ship was sinking, about 400 miles off Cape Race. Later reports stated that the ship was slowly making her way to Halifax, Nova Scotia. The "Titanic" left Southampton on the 10th. As she swept from her berth she came near to causing an accident to the American liner "New York," but serious damage was averted. The "Titanic" cost \$10,000,000. Her tonnage is 45,328, and her length 882½ feet, or about four city blocks. She has four funnels and eleven decks. The distance from the keel to the top of the funnels is 175 feet. Her average speed is 21 knots per hour. The ship can accommodate 2,500 passengers, and her passenger list on her maiden voyage included Bruce Ismay, president of the International Mercantile Marine; W. T. Stead, editor of the *English Review of Reviews*; Alfred G. Vanderbilt, Benjamin Guggenheim, Henry B. Harris, the New York theatrical manager; Colonel and Mrs. John Jacob Astor, Norman Craig, K. C., a member of Parliament on the Unionist side, and other well-known people. The captain of the ship, E. J. Smith, formerly commanded the White Star liner "Olympic." He has followed the sea since 1869, when he shipped as an apprentice on the "Senator Weber," an American clipper that had just been

purchased by a Liverpool firm. He has commanded a dozen ocean liners since then.

Home Rule for Ireland?

Mr. Asquith introduced "The Government of Ireland bill" in the House of Commons April 11. This is the third bill providing for home rule to be offered by the Liberal party, Gladstone's two bills being introduced in 1886 and 1893. The Prime Minister spoke for two hours only. He was cheered when he said home rule for Ireland was but the first step, that home rule for the other divisions of the kingdom should follow. The leader of the Irish Nationalists, Mr. John Redmond, said that his party was not separated, as in the days of Parnell:

"We are ready and willing to accept an Irish Parliament subordinate to the British law-making body, which may prescribe proper safeguards for Irish legislation. The bill presented by Premier Asquith is excellent. I thank God I have lived to see this day."

As stated in an earlier issue of THE INDEPENDENT, the bill provides for an Irish Senate (appointive) and House of Commons, with power to legislate for Ireland, but "not on the Crown, the army and navy, imperial affairs, the land purchase scheme, old age pensions; national insurance, the constabulary (for six years), the post office savings banks, public loans, and certain details of the customs." Provision is made for the veto of acts of the Irish Parliament. Forty-two members will be sent to Westminster by Irish constituencies, one for every 100,000 of the population. The keynote of the bill is, the London *Standard* (Unionist) says:

"the term with which Sir Edward Carson opened his trenchant attack: 'fantastic.'"

This Sir Edward is a member from Ulster who lately gained notoriety from threats as to what form "loyalism" will take if home rule is finally granted. He and Andrew Bonar Law, the new Unionist leader, recently reviewed a procession of 150,000 Ulstermen at Belfast—a demonstration of North of Ireland opposition to home rule. A similar demonstration in Dublin by Orangemen brought in for the occasion is being discussed at Belfast, but will doubtless be abandoned, as it would mean a

bloody conflict. Unionist enemies of the new plan for autonomy say that "it must break down in practice." The jingo *Daily Mail* complains that it is unjust for English taxpayers

"to make over about £2,000,000 for purely Irish and purely local expenditures."

The Liberal press is not uniformly enthusiastic, but prophesies that the bill's passage

"will mark the beginning of a new and happier chapter in the dark history of John Bull's Other Island."

The Government does not expect the House of Lords to vote the bill, but hopes to pass it over the Lords' veto.

—The Board of Trade states that 31,058 emigrants left Ireland in 1911, of whom 22,010 came to the United States and 5,478 to Canada.—Three-fifths of the British coal miners had returned to work a week ago, but rioting was reported from Lancashire and troops called for. On April 12 the price of coal in England dropped \$2.50 per ton.—Messages have been sent and received by a British military scout in an aeroplane, several miles from his base.—Maurice Prévost made a Channel crossing by aeroplane on April 13, carrying a passenger. He left Paris at 6.45 a. m. and landed at Eastchurch, County Kent, at 1.30 p. m.—The Paris *Matin* is arranging an aero race from Paris to Peking. Prizes of \$20,000, \$5,000 and \$2,000 are offered.

The French budget was introduced in the Chamber of Deputies

on April 10. Its amount is \$932,933,000. Sixteen million dollars more is provided for the national defense than in the 1912 budget, this being about one-half of the total increase. M. Poincaré, the Prime Minister, in unveiling a statue of King Edward VII at Cannes, said on April 13 that France was for peace, and "will neither attack nor provoke," but will safeguard her rights and dignity by "men and money, naval and military power." —A French column under General Ditté routed a large force of rebel tribesmen near Machel, in Morocco, in an engagement of thirteen hours on April 8. An engagement west of Debdu was reported on April 10, the French dispersing 2,500 tribesmen with a loss of one

officer killed and four wounded, twenty men killed and sixty-three wounded.

The Near East A St. Petersburg despatch says that proposals for mediation between Turkey and Italy have been made by the Powers collectively. Meanwhile the Italians have occupied Fort Bukemmesh in Tripoli, commanding the Tunisian caravan routes. The Turks and Arabs have received most of their arms and ammunition by these routes. Italians are said also to have landed in Libya. Another victory at Bengazi has, however, been claimed by the Turks. —Salar-ed-Dowleh, the ex-Shah of Persia, has again refused to leave the country, at the urging of Russia and Great Britain. He says that he alone can restore order in Persia, which is now under the nominal rule of his young nephew. His brother, Shua-es-Sultaneh, is in St. Petersburg. Southern Persia is in a state of chaos. Disorders have been reported from Ispahan and Meshed, where Russian troops bombarded a mosque and took possession of the town, and there is suffering from a scarcity of food at the capital. British and Indian trade have suffered from the situation.—A British blue book, issued April 12, contains data upon the Persian situation, and blames W. Morgan Shuster, the ex-Treasurer-General, for his attitude, “so regardless, I might even say so provocative, of Russia, that it could hardly be expected that Russia would regard the incident leniently.” The quotation is from a letter of the British Foreign Secretary, Sir Edward Grey. Six Belgian officials, formerly of the Finance Department at Brussels, are en route for Teheran to enter the service of customs and the treasury.

The New China The mutiny of regular troops at Nanking was put down by the execution of ringleaders and shooting down of whole companies of men, according to dispatches received last week. Two miles of suburban villages had been burned, and a force of 10,000 was called upon to restore order. No quarter was given. Other towns looted during the last fortnight are Pao-ting, Han-chow and Tung-

chow. Order was restored at Swa-tow only after a force of 3,000 loyal soldiers had arrived, as well as American, British and Japanese marines. The rumored assassination of the Vice-President of the Republic, Li Yuen-heng, has been denied. President Yuan Shi-kai has also denied rumors that China may be divided into four separate countries, with Peking, Nanking, Canton and Chung-king as capitals. The Advisory Council of the new Government is soon to move from Nanking to Peking, where it will assume the functions of the National Assembly, until the convening of that body, in the autumn. Yuan Shi-kai is said to desire a ten year term instead of the proposed term of seven years, on the ground that the first President ought to be given time enough to get China well started on the road of progress. Dr. Sun is reported to have said

“I have just finished the political revolution, and now will commence the greatest social revolution in the world’s history. The future policy of the republic will be in the direction of socialism. I am an ardent follower of Henry George, whose theories are practicable in China.”

It is asserted that Wu Ting-fang, Minister of the Chinese Empire to the United States, 1897-1902, and 1907-1909, will represent the new republic at Washington.—Russia wishes to participate in the negotiation of a large Chinese loan, on condition of receiving monopolistic control of Mongolia, Turkestan, Tibet, Kansu, the city of Kob-do, etc. The *Novoe Vremya* of St. Petersburg wishes to see America frozen out, and an Asian “Monroe Doctrine” proclaimed in their own interest by Russia, France, Japan and Great Britain. Bad feeling still prevails in Government circles on account of the American action on the Russian passport question.—China’s position today is weakened by the fact of a great treasury deficit. As early as April 6, \$14,000,000 had been advanced to the new government by the Belgian syndicate which has been discussed in these pages.—Congratulations to the people of China on assuming the “powers, duties and responsibilities of self-government” were extended by the United States Senate on April 13 in passing the joint resolution offered by Representative William Sulzer, of New York.

For the Want of a Becket*

BY JAMES H. WILLIAMS

[Like all of Mr. Williams's yarns, this is a true account of one of his voyages. He has just returned to New York after two years at sea, but no doubt as soon as his broken leg gets well enough he will sail away again.—EDITOR.]

For the want of a seizing the becket was lost,
For the want of a becket the sailor was lost,
For the want of a sailor the canvas was lost,
For the want of the canvas the rigging was lost,

And the ship to her beams was in jeopardy tossed,

'Twas all for the want of a fathom of yarn.

CROUCHING low and huddling close beneath the tattered hood of the flimsy bamboo half round that canopied the midship section of the bumboat, we first glimpsed the towering spars and majestic proportions of our next venture, the "Late Commander," riding idly astream in the gradually diminishing distance, while Sam Doss, our turbaned dinghy wallah, ferried us skilfully across the surging current of the turbulent Hoogli. There were four of us in the bunch, Big Mac, Little Mac, Spike Riley and I, John Brown, of San Francisco. We were the only Yankee sailors on the beach and had been sent down from Calcutta to complete the complement of the "Late Commander." From the narrow vantage of our crowded and cramped position beneath the little hood we commanded a fine view of the lofty wind-jammer tugging stolidly at her anchor-cable, and could form an estimate of her size, rig, carrying capacity and sailing powers.

The ship was lying well over toward the left bank of the river, and she loomed large against the verdant scenery of the distant landscape.

She was a large, stately, composite British East Indiaman, with wooden hull and iron top sides, and had evidently been built during the transition period, when iron was gradually displacing wood in marine construction and had not yet been finally adopted by naval architects as a safe building material.

She was a ship of rising 2,500 tons

register and about 5,000 tons burden. She was broad in the bilge and bluff in the bows, and was evidently built for carrying rather than racing, but the lofty poise of her sturdy masts and the enormous sweep of her towering yards gave token of great sailing power in strong winds and the ability to carry on in heavy weather. Her lower masts and yards were of steel and her upper masts and lighter spars of pitch pine. She had an unusually sharp tumble home to her waists, which gave her somewhat the appearance of an old-time frigate, an illusion which was highly accentuated from a distance by the two rows of grim-looking false ports painted along her sides.

The high-flung fiddle-head beneath her big bowsprit was decorated with the carved figure of a grim old admiral of doubtful identity, clad in full dress wooden uniform and grasping a wooden sword with a scowl of graven ferocity.

Such was our first impression of the stately ship riding majestically astream, loaded to her Plimsolls with baled jute and bagged linseed consigned to New York.

When the dinghy rounded handsomely alongside we all sprang nimbly to the grating and made a Yankee hustle up the gangway. At the head of the ladder we were met by our chief officer, Mr. Riggins, who greeted us with that air of gruff civility so peculiar to English deep-water mates of the old school.

"Welcome aboard, lads!" he exclaimed, heartily. "Glad to see you're so spry. Nimble men is what we want here. Go forrard now and get yourselves stowed and stand by; we bend sails tomorrow."

The first order of business next morning was to bend sails, and immediately after disposing of our early coffee we started to break out the lockers. Our crew consisted of twenty-two A. B's (Able Bodies) and six ordinary seamen, together with three mates and four ap-

*Becket: Generally, any bight or loop of rope that may be readily grasped by the hand, as the bale of a draw bucket, the lug of a sea chest or the grummet of a fender. Specifically: A short loop of hemp or wire rope permanently attached to the iron jackstay on a yard arm to which sailors may cling in times of danger.—J. H. W.

prentices, besides a full list of petty officers. A heavy crew, no doubt, for a merchantman, but not a man too many, for the "Late Commander" was a heavily sparred ship and she was fitted aloft and aloft almost thruout with dummy blocks and "Armstrong" patents.

Before noon we had all the sails aloft festooned along the yards, and the remainder of the day was spent in hauling out, shackling up, bending on and reeving off running gear. Spike Riley and I were working together on the main to gallant yard, assisted by Barney Dent, a superannuated old barnacle, who constantly insisted that he was only "knock-in' 'roun' ter save fun'ral expenses," but nevertheless clung to everything tangible aloft with a grim resolve that rather belied his oft asserted notions of *post mortem* economy.

"Be there never a becket on these yards, mate?" demanded Spike Riley, who was sitting carelessly astride the yard arm mousing a clip hook on the quarter lift, his long legs dangling loosely in mid air.

"Damn the wan I seen," spluttered old Barney, as he ejected a torrent of tobacco juice forward of the yard, regardless of consequences to people or things below, and gummed his quid for a fresh endeavor. "Damn the wan I seen an' I'm three years in the ship. There do be a few loops o' junk on some o' ther jack stays, but God save ther man what grabs wan uv 'em on a dark night an it blowin'; he might as well be grabbin' a rope o' sand."

"They ought to be beckets," said Spike, solemnly, "'cause ther heads o' ther sails bend up so close ter ther jack stays there's no room fer a hand holt. They ought ter give a feller some chance fer his life!"

"There ought ter be lots o' things wot ain't an' lots more what never was an' ain't goin' ter be," mumbled old "Daddy," pessimistically. "It's both han's fer ther ship here an' hang on be yer eye-brows."

At knock-off time that night all our sails were bent and neatly furled, and our ship was snug and trim and all ready for sea. After mess all hands gathered beneath the forecastle awning, and a lengthy discussion ensued on the subject of beckets and life lines and sav-

ing gear generally. The deplorable neglect of shipowners to provide such appliances and the unnecessary hazard of life and limb to which seamen were constantly exposed in consequence was roundly criticised and severely denounced, but since no one had any remedy to propose we turned in for the night no wiser nor safer nor better for our evening growl.

Next morning bright and early the big paddle wheel Hoogli tug "Warren Hastings" came hooting and threshing noisily and ostentatiously alongside, furnished us a pilot, took the great coir-spring of our steel hawser, passed us the spring of our own, and then, sweeping ahead, took up the slack of both cables and held our ship against the current while we shipped our heavy capstan bars and proceeded to heave up our anchor.

Then to the heavy trundle of our steadfast windlass and the merry rattle of the capstan pawls we trudged and tramped sturdily around the forecastle deck, raising chantie after chantie, while the natives lined the shore in silent and awe-struck wonder as we fetched our anchor home. When our mud-hook was broken out, we ceased our labors at the

JAMES H. WILLIAMS

clanking windlass, unshipped our capstan bars and raised the joyous signal: "Anchor's away!" Then the "Hastings" took up the long scope of our mighty hawsers, swung our prow down stream and started us for the open sea.

All that day we swept along the muddy current, thru the tortuous windings and between the wooded banks of the Hoogli, over the treacherous quicksands at the James and Mary's, across Diamond Harbor, past the verdant shores of Sanger Island, and the sun was still mast-heads high when we emerged safely thru the low reaches of Sand Heads into the broad blue sweep of Bengal Bay.

There the "Hastings" dropped our hawsers, screeched a parting salute from her strident siren and scurried back to the shelter of Sanger, while we, with all sail set, stood gallantly away on our westward course.

For the first three days of the voyage we encountered light, baffling winds and did not average over one hundred miles a day. On the fourth day there fell a tense and awful calm. A deep and awesome silence, more terrible than the wildest storm, reigned over sea and sky.

The terrific heat of the blazing sun seemed doubly concentrated on our narrow decks. The molten pitch bubbled from the seams and spread over the whitened planking until it resembled the murky floor of the cane-press; the tar streamed from our well-set rigging and covered the channels with a redolent smear; the paint blistered on the waterways and the sails hung against the masts in wrinkled folds as limp and motionless as the rigid drapings around a bronze statue; not the slightest sign of atmospheric movement was discernible; a feather dropped from aloft fell straightway to the deck with no more flutter than an iron bolt. The crew sought in vain for shelter from the scorching heat, the fowls died in their coops, the ship lay in a dense and absolute slick, and all nature seemed gasping for breath.

Indeed it was an experience to remind us all of the woeful lay of the Ancient Mariner, and cause us to ask ourselves and each other, with sane and serious intent, "Who is the Jonah among us?"

Toward evening, however, while the sea and sky were still aflame with the brilliant colors and fascinating hues which make up the glorious aurora of an Indian sunset, a grateful little breeze wafted over the ship, slightly rustling the listless sails and rippling the glassy sea into wisp-like catspaws. But shortly after sundown a low range of black and ugly-looking thunder-heads suddenly appeared above the western horizon and spread with amazing speed and ominous gloom across the glowing sky. Then we knew that one of those appalling bay squalls, known as the "Bengal Tiger," was about to envelop us; and we prepared to meet it.

These bay squalls are the terror of all Bengal sailors. Rising suddenly after prolonged seasons of blighting heat, they always begin after nightfall and blow with hurricane violence and destructive force, and are invariably accompanied by the appalling phenomena of terrifying electric displays. Blinding lightning, terrific thunder, drenching rain and intense darkness are the inevitable concomitants of a Bengal squall.

Early in the evening we furled our royals and skysails and lighter staysails, and later, as the tempest loomed larger and blacker and more threatening, and as the lightning flashes became more vivid and frequent, and the rattling of the thunder drew nearer and became more terrific with each succeeding crash, we shortened down to a full set main to'gallant sail and stood by for orders.

It was about 10 o'clock at night when the squall struck us just abeam, and the ship heeled over with rails awash and fled before it like a frightened gull. In ten minutes our big main to'gallant sail was clewed up and hung floundering wildly in the buntlines, and while eight men were sent up to furl it, the remainder of the crew were kept on deck with orders to stand by the lower tucks and sheets and see the topsail halyards clear.

At the lofty altitude of the topgallant yard we stood in the center of a wild and awesome grandeur which inspired us with mingled feelings of fear and admiration. The shrieking wind, the complaining spars, the floundering canvas, the flaming sky, the pitch-black darkness, the crashing thunder, the phos-

phorescent crests of the breaking seas and the fiery streak of the brilliant wake left behind by the reeling ship were enough to inspire the densest mortal with an inward sense of divine magnificence and his own insignificance.

Laying out along the yard-arms and striving to shield our faces from the incessant lashing of the blinding, stifling rain, we cleared our gaskets and strove to make a wrinkle in the belly of the stiffened sail, ballooning over the yard-arm as rigid as boiler plate.

At length, in a momentary lull, the sail relaxed slightly for an instant, and seizing this temporary opportunity, we drove our fingers into the fluttering cloths and with loud yells of encouragement to each other sought to drag them up to the yard. Big Mac and I stood in the bunt, struggling with might and main with the refractory canvas. For the rest, I could not tell who was on the yard-arms, for the vivid flashes of lightning were even more blinding than the black darkness which succeeded them, and in the uproar of the mighty tempest the sound of our voices was indistinguishable.

But at length, when we had almost succeeded in smothering the mighty sail and were all eagerly striving to get the foot roping for a homeward bound roll onto the yard, there came a sudden blast of renewed intensity, and altho we clung on to the last fiber of our united strength, the canvas was torn from our grasp, and again the great sail ballooned exultantly upward, threshing and roaring madly against the mast above our heads, with a force and velocity that threatened to bring the rigging down.

Then it was that I suddenly felt an ominous slackening of the foot rope and was conscious of a vacant place beside me on the yardarm. By the light of the next flash of lightning I glimpsed a shape hurtling swiftly thru mid air fifty yards from the ship, and by the next flash I saw the climbing crest of an on-rushing wave break mercifully over an upturned face and a fugitive cap careering away to leeward. Then I knew that old Barney Dent had saved his funeral expenses; that he had gone to eternity for the want of a becket!

Next morning the storm had passed, the sun rose clear and serene and with

all sail set again the ship was slanting gallantly down the bay under the freshening impulse of a brisk westerly breeze. When the starboard watch came below to breakfast, the spare bunk in the fore-castle and the vacant place at the mess-board were silent reminders of the tragedy of the previous night.

Naturally we were imprest with the loss of our old shipmate, for old "Daddy," as he was always affectionately called, had been very popular among the younger members of the crew, and his sudden and unexpected taking off filled all our hearts with genuine sorrow, and inspired us with angry resentment against the miserly, hair-splitting policy of our owners which we believed to have been responsible for his death. In the course of our breakfast conversation our owners and officers came in for a season of heartfelt denunciation and bitter invective that would have made their hair rise if they could have heard it.

"It's jest plain murder, that's what it is," growled Spike Riley, preparing to turn in. "Ther greedy vampires 'll give a sailor's life any time ter save a fathom o' rope. 'Tain't no use pratin' to us 'bout economy. That ain't the name o' ther crime! This 'ere ship is seventeen years old be ther date on her bell, and ther firm's built a dozen better ones sence that outen ther proceeds of her freights. They keep right on everlastin'ly a-paintin' her bends, and scrapin' her spars, and gildin' her trucks, and varnishin' her poop, and polishin' her bright work, but there's never time nor tuckle to put on a few hol'fasts aloft! I know ther law can't tech 'em," continued Spike, gloomily; "ther law's a liar most-wise anyhow, but if ther devil don't get 'em in ther long run, then I like ter know what ther devil ther devil's good for, anyhow!" And having relieved his feelings to this extent, Spike rolled into his bunk and went to sleep.

"Say, fellers," continued Little Mac, as the watch began one after another to retire, "don't trust that ol' man-rope on ther jibboom. Ther lashin's plumb rotten, jest a frayed out ol' piece o' junk. I axed ther bos'un fer a piece o' new stuff ter set it up with the day we rigged ther boom out, but he called me down fer it; said I was too perticular. He 'lowed thet thet thar lashin' had b'en ther

fer five years an' was good enough now. But you bet I don't trust it, ther jibs kin go ter blazes if they want'er, but I ain't b'en to sea twenty years and don't know when ther life's stretched outen a piece o' rope!"

Going down the bright sou'west monsoons across the broad sweep of the warm Indian Ocean we found time to become better acquainted with each other and to indulge in the few pastimes which a tall-water voyage affords.

Our skipper's name was Grummet, a hard visaged, crusty old tyrant as grim as a graven image and as silent as the Sphinx. His chief executive, Mister Riggins, was a large masterful man of middle age, a thoroughly practical seaman as well as a skilful navigator, and he esteemed his two subordinate mates but little because they were both training ship graduates. Our bo'sun, Tom Splicer, was a leather-lunged old veteran, with a voice like a human calliope, and his mate, Jack Fidd, was a remarkable combination of legs, lungs and sea-boots.

Among the apprentices was a young gentleman named Alfred Pengelley, with whom I soon formed a strong and lasting friendship. Pengelley was a native of Cornwall and his father was a lieutenant in the Royal Navy. He was a well bred, well read, manly young fellow, about twenty years of age, and, in spite of the fact that he was entirely unsuited by nature for a seafaring life and was out of place on shipboard, was the idol and admiration of the whole crew.

Altho in point of birth, breeding and culture Pengelley belonged to a higher social grade in longshore estimation than the rest of us he never allowed this superiority in any way to be felt. A civil, well mannered young fellow, he always carried himself with an air of quiet dignity and natural courtesy that always distinguishes the true gentleman, and commanded our respect without demanding it. He was a large, handsome boy with frank, intelligent brown eyes and glossy chestnut hair; rather overgrown he was, tho perfectly healthy. Always frank and affable and invariably good natured, he was likewise studiously inclined, and deeply, tho unostentatiously, religious.

Often in the second "dog-watch" in fine weather, when our day's work was

done and the daylight still lingered, he would slip forward to witness our evening sports. He always greatly enjoyed our games and contests of strength or agility, boxing, racing, wrestling, jumping or climbing stunts, and would always cheer and applaud the winners unstintedly, altho he never participated in the games himself.

Pengelley's great drawing card among the crew was his beautiful singing. He possessed a magnificent baritone voice of marvelous power and enchanting melody and his range of patriotic, naval and sentimental songs seemed almost endless. He never needed any urging to sing, but seemed to consider it his own legitimate contribution to our simple pastimes.

Thus we sang and danced and played our evenings away, for time passes swiftly at sea—until we ran out of the pleasant monsoons and began to feel the rougher weather of the Cape.

We enjoyed fine weather and a fair wind rounding the Cape of Good Hope, but the same night were overtaken by a strong southeast gale, and before midnight our ship was staggering blindly away to the northwest under three top-gallant sails, topsails and fore and main courses. The storm increased in violence during the night with a rapidly rising sea, and in the middle watch all hands were called to shorten down.

As soon as both watches had assembled on deck the fore and mizzen top-gallant sails were clewed up and the flying jib hauled down.

When Tom Splicer's stentorian voice was heard bellowing above the storm, "tie 'em up," I happened to be near the lee fore-rigging; so I mounted the fore-castle-head to reach the jibboom. When I got to the knight-heads I saw two figures already out on the bowsprit ahead of me. In the darkness I could not distinguish them, but followed them out.

By the time I reached the head of the bowsprit my two predecessors were well out on the jibboom waiting for me to reach them and help get in the clew of the wildly threshing jib. Just then a mighty sea broke completely over the ship and her great bows were flung high in air until her very fore-foot left the water. Then as the sea rushed from under her she fell bodily forward, driving boom and bowsprit, fore-castle deck and

all completely under water so that she stood for a time practically head downward and stern in air.

Realizing from the first what was about to happen, I locked both arms around the collar of the jib-stay and clung for dear life.

In an instant Little Mac's warning about the rotten bolt-lashing on the man-rope flashed thru my mind and I tried to shout a warning to my shipmates out on the boom, but my voice was stifled in the mighty tempest and the next instant I was plunged beneath the brine. Down, down, down I went, how far I never knew, clinging desperately to the stay; and holding my breath I held on with the desperation of despair. In the downward wash of the great ship my feet were swept from the foot-rope and my body was flung outward at right angles to the bowsprit like a pennant in a morning breeze, and it seemed as if my arms would be torn from their sockets. My big sou'wester came off and the chin-strap clung around my neck, and altho I was holding my breath, still I could feel that the pressure of the water inside the helmet was strangling me. But even in that awful extremity the spirit of worldly mindedness was still strong within me and I inwardly cursed when the chin-strap broke and my valued sou'wester was swept away.

At length the downward motion was reversed and the ship's bows began to heave upward again; then the tension on my arms was increased until, perfectly familiar with the head-fittings of the bowsprit, I managed after a brief struggle to get my feet securely onto the wooden beading which held the nips of the stays; this relieved the terrible strain on my arms and thus I clung until, what seemed an age later, the ship's bows were flung upward again and I felt the cold air in my face and heard the noise of the storm in my ears. There I hung for a moment choking and gasping for breath. Then, at length I pawed the brine from my steaming face and eyes and glanced forward, and lo, I stood on the foot-rope alone! Both of my comrades were gone, and the fag-end of the sundered man-rope lashing furiously in the wind showed the way of their going—they had followed old Barney Dent, *for the want of a becket!* The jib had split and was

fluttering in tatters across the head-guys, and I made my way as rapidly as possible inboard to report the awful tidings to those on deck.

By this time the storm had redoubled its fury, and altho the ship was driving free and still carrying a good pressure of sail, the big combers were constantly racing under her counter and breaching the quarterdeck at will. A part of the crew were still aloft furling the fore and mizzen to'gallant sails, and the remainder were engaged in stretching life lines and grab ropes across the deck. I found the bo'sun, Tom Splicer, at the main fife-rail bellowing orders, and I seized him frantically by the arm. "Tom," I roared in his ear, "Tom, two men washed off the jibboom when she dipped that time; man-rope parted! Flying jib's gone out o' the bolt ropes! Tell the mate!"

I jerked these broken sentences into his ear as rapidly as possible, watching the weather-rail meanwhile to dodge the next comber.

"Who was they?" bellowed Tom excitedly.

"Don't know," I answered shortly, "couldn't see in the dark; besides, I went under too!"

"O God," he exclaimed with an inward groan; "they're as dead as they ever will be!"

Just then Mr. Riggin's big voice came howling thru a speaking trumpet, "Clew up the main to'gallant sail; haul up the fore and mainsail! Lively there, bo'sun!"

"Aye, aye, sir," roared Tom Splicer, getting into immediate action; and in the tumult and confusion that followed we did not discover until next morning that our two lost shipmates were Stavanger Lars and Geordie Jack, two of our most jovial and popular comrades.

By this time the fore and mizzen top-gallant sails were fast and the hands were straggling down from aloft. So with our large crowd we were able to man the main to'gallant gear and the fore and main clew garnets simultaneously. When the main to'gallant hal-yards were started they refused to run and the sheets refused to render thru the sheave holes, while the big to'gallant sail with the gear released was creating a tremendous commotion aloft. In the blank darkness of the stormy night it was impossible to see from the deck what

was wrong. Therefore, responding to the mate's order, I went up to find out. When I reached the topmast head, I saw at once that the chain-tie connecting the yard with the halyards had snapped just above the truss; the big sixty-foot yard had descended "by the run" and was now swinging wildly acockbill and threatening every moment to bring down the to'gallant mast. Thru the roar of the storm my voice would not carry to the deck, so I drew my sheath knife and split the belly of the floundering sail in as many places as I could reach in order to spill the wind; then I descended to the deck and reported the trouble aloft.

"Can't yer git out on the yard arm and bend on a preventer line ter steady her?" demanded Tom Splicer officiously, when I had made my report.

"No," I answered, decisively, "all four of the lifts are gone and there are no becketts on the yard."

The next instant there came a warning bellow from the poop magnified thru the resonant trumpet: "Stand by forward! Look out to wind'ard!" And glancing over the weather rail we saw three tremendous seas, with towering white crests rushing with incredible speed, and close upon each other, straight toward the staggering ship.

Every man sprang for safety to his nearest place of vantage, and hung on for dear life. I leapt to the main fife-rail and grasped the topsail sheets, and an instant later the foremost wave broke with terrific violence over the rail, hove the ship to her beam ends and buried her hulk under thousands of tons of water, and before she could rise again and shake off the enormous weight above her decks the next two seas boarded her in rapid succession and almost completed our destruction. As the last sea swept over the struggling ship we felt a heavy, startling jolt, as tho we had struck a sunken rock; the whole fabric trembled violently from stem to stern with the force of the shock, and after the seas had passed the ship slowly settled on her port side until her hatch combings were awash and lay as dead and helpless as a derelict.

Then we all surmised the fearful truth: The three thousand tons of jute, which formed a part of our cargo, had been idiotically stowed on top of the large consignment of slippery linseed, and

now, loosened by two months of constant wrenching in the sea way, it had been started by the unusually abrupt pitching of the hull and fetched away bodily into the wing, heaving the ship down rails under and holding her firmly on her beams at an exceedingly dangerous angle. Then, before we had time to appreciate the awful peril of our position, there came a terrific rending crash, flashes of living fire streamed from shattered bolts and iron chain plates followed by the snarling twang of sundered rigging and the cracking sound of broken spars. The loose to'gallant sail caught in the intense angle of the ship's list had at last jumped the main topgallant mast from its fid, and the broken spars in falling had also dragged the mizzen topgallant mast and topmast with them over the side. A moment later the fore topgallant mast, deprived of its after support, followed them, wrenching the flying jibboom short off at the bowsprit cap. This seeming catastrophe, serious as it appeared, was really fortunate, for nothing else could have saved us from total destruction. Relieved suddenly of the enormous weight and leverage of her top hamper, the ship gradually rose her lee rails awash and righted herself to windward. Thus, tho still far from an even keel, she was in a far less dangerous position and much more manageable than before.

Immediately the supreme crisis was past we set to work as expeditiously as possible to clear away the wreckage, for the broken spars floating alongside and swinging by their numerous attachments were pounding with frightful violence against the ship's waist.

Axes, sheath knives, wire pliers and pinch bars were at once brought into requisition, and the dangerous work of cutting and clearing away the maze of tangled rigging went bravely on, and, fortunately, was accomplished without serious mishap to any of our crew.

When the rigging had been cleared and the broken spars cut adrift we took in all remaining sail except the main lower topsail and foretopmast staysail, and brought the dismantled ship head to the wind. Then we clung to the rigging and "wished for the day."

At length the morning broke over a wild and desolate scene. A heavy low-

ering sky, a cold drenching rain, and a sadly crippled ship in the relentless grasp of a howling tempest, floundering helplessly in the midst of a waste of angry seas. The maintopsail of itself was not sufficient to keep the ship head to the sea. To set more sail was impracticable as well as perilous, besides the topsail itself was likely to be blown from the bolt ropes at any moment, and in that case the result would have been disastrous.

Therefore the mate decided if possible to rig up a sea-anchor and endeavor to hold the ship's bows to windward at all hazards. As soon as it was light enough to see, all hands were called down from their several "safety" perches and after receiving a gill of rum all around in lieu of breakfast, we were at once set to work to construct the sea-anchor and rig it out.

To accomplish this our studding sail booms had to be sacrificed.

Two of these splendid spars, each about fifty feet long, were sawn in two, then the ends laid together were securely bolted thru and clamped, and still further secured with heavy cross-lashings. This made a huge diamond-shaped frame exactly like the frame of an ordinary kite. A heavy spar was then securely bolted and lashed across the center of the frame on one side, to make fast to, the other side, or face of the kite, being completely covered with several courses of tarpaulin cloth securely fastened to the sides of the frame and strongly supplemented by heavy planking held down by iron spikes. Next a seven hundred pound kedge anchor was attached by a short length of chain to one end of the frame. This formed the tail of our enormous kite and the purpose of it was to weight the whole contrivance so as to hold it in an upright position in the water, exactly as an ordinary kite must be ballasted to maintain its equilibrium in mid-air.

One hundred and twenty fathoms of new ten-inch hawser were then broken out. One end of this line was passed thru a hole in the center of the tarpaulins and firmly secured to the cross beam behind the frame. The other end was carried over the bows, passed thru a hawse-chock, doubly secured to the samson-post, and finally made fast around the foremast.

All these preparations required a good deal of time, and were only accomplished by the most strenuous labor, and in the face of direst hazard to all concerned; but fortunately we finished in safety tho it was nearly noon before we were thru.

When at length our sea anchor was complete, and all its attachments secure and ready, we cock-billed the huge frame on the weather rail and dumped the whole contrivance overboard. The drift of the ship soon picked up the slack of the hawser, and the mighty resistance of the huge kite suspended upright in the water was sufficient to check her leeway and hold her head fairly to the sea.

This done we took in our main topsail, lashing two tarpaulins in the weather mizzen-shrouds instead, and left our foretopmast staysail set to ease the ship's head off the wind sufficiently to enable her to ride the seas.

After another round of grog, we were set to try the pumps, for, altho the ship, in spite of her furious laboring, had not sprung a leak, the ventilators had been washed away and large volumes of water had poured into the hold. It was nearly two hours before the pumps sucked, and then one weary watch was sent below for a much needed rest.

But we found our quarters in a woful condition, for the sea had completely gutted our forecastle and every item of our clothes and bedding had been swept away. To make matters worse, the galley had been washed out and no food could be cooked. Most terrible of all, the hood to our main tank had burst, and our entire supply of fresh water had been defiled with brine.

I can never even attempt adequately to describe the terrible sufferings we endured in the days that followed. The awful pangs of thirst and the unbearable agony caused by the constant chafing of our salt encrusted clothes were too maddening in their intensity to be told.

In the bottom of a reserve tank beneath the poop, which had not been filled in years, we found a small quantity of rusty drainings, thick as mush with iron rust and slime, but all this filthy dampness, muddy and corroded as it was, was carefully scraped together and the bottom mopped dry with rags. And when the last drop of moisture doled out to us

in spoonfuls had been consumed, we glared and craved each other's blood.

As soon as the storm had blown out and the sea had subsided sufficiently to permit us to remove the hatches, we went down into the hold and rolled as many bales of jute as we could back to starboard against the empty wing from which they had shifted, thus righting the ship. Then three days were spent in rigging up jury spars and inventing jury sails to fit them, and after that we made every exertion to reach the Southeast Trades, keeping a sharp lookout by day and night for sight or sign of a passing sail, but all in vain!

Early one morning, fourteen days later, the lookout at the military station on the summit of Saint Helena sighted a large ship under jury rig heading toward the island.

The wind was light and she was moving slowly and still over one hundred miles away. The military telescope revealed her in wretched condition, as tho she had lately encountered a fearful storm, and if anything were lacking in confirmation the two black shapes suspended from her masthead as a signal of distress were sufficient confirmation. Her sides were bare and weather beaten; all of her boats were gone; her figure-head had been torn from its fastenings; across the face of her foretopsail was painted in hugh black letters the one awful word: WATER, and the numbers fluttering from her mizzen peak revealed her name: "Late Commander."

It was evidently impossible for her to reach the island that day unless the wind increased soon, which seemed improbable, and therefore a boat was sent out with a rescuing crew to meet her.

Thruout that long morning we gazed with burning, bloodshot eyes toward that distant peak, hanging like a small blue cloud on the northern horizon, and prayed fervently for wind. Shortly after midday we observed a tiny dark speck between us and the far-off rock, and as it grew larger Captain Grummet lowered the glass which had long been glued to his eye and announced in a cracked voice that crackled with joy, that it was a *water boat*.

And as the little craft drew nearer we saw, to our inexpressible delight, that it was a lugger, crowding sail and manned

by six lusty negro rowers and a negro coxswain. We welcomed them alongside with a cheer feeble but joyful. Water was given to us at first in moderate doses, but we were allowed to lave and wash our parched and salt encrusted bodies and brine starched clothes freely in the life-giving liquid, and this treatment afforded us ineffable relief.

They also brought us a small quantity of fresh vegetables and these were ravenously devoured without the formality of cooking them.

After ministering to our urgent bodily needs, the generous negroes came on board, and allowing their boat to tow astern, helped us to navigate the ship up to the island.

It was past midnight when we reached Saint Helena and dropped anchor on the little bank in front of Jamestown. Late as the hour was we were immediately surrounded by a swarm of bumboats loaded with eager visitors, and during all our stay at the anchorage we never lacked for company.

For a full week we lay under the shadow of the famous Rock, recuperating our strength, trimming our cargo and improving our jury rig, so that by the time we sailed we were able to show quite a respectable spread of canvas. During our stay at the island we were allowed a credit of £2 each to buy clothes, and by the doctor's orders we were also granted one day's liberty all round for the general benefit of our health.

We explored the island from water's edge to summit, and spent our allotments to the best advantage, and it is safe to assert that since the days of the Great Exile no visitors to Saint Helena, either royal or plebeian, ever departed with a heartier send-off than the grateful crew of the "Late Commander."

We reached New York without any further noteworthy incident, altho our passage was somewhat prolonged on account of our scanty rig; and we lay three months in port discharging and loading cargo and undergoing necessary repairs, both to hull and rigging.

It was May when we sailed again, loaded to the hatch covers with a full cargo for Calcutta: but that story must be told later.

NEW YORK CITY.

What Is the Matter with Our Army?

BY HENRY L. STIMSON

[This article by the Secretary of War concludes our Army series under the above title. Articles have already appeared by Major-General Wood, Brigadier-General Wotherspoon, Brigadier-General Edwards, Lieutenant-Colonel Leggett, Major Shelton and Brigadier-General Evans.—EDITOR.]

THE title to this series of articles on our army is somewhat misleading. The fault is not so much with our army as it is with ourselves as a nation. So far as the units of our army are concerned—its officers and its men—the standard of individual excellence is high. The academy at West Point has long held an enviable reputation among the training schools of the world. The military education, which used to end when the graduate left West Point, is now carried on thru a succession of excellent post-graduate schools. Under the legislation enacted ten years ago, when Mr. Root was Secretary of War, the capable and ambitious officer who is interested in his profession can look forward to a long course of training, carrying him thru the schools of the line and the staff at Leavenworth, the War College at Washington, and finally, if his capacity stands these successive tests, into the General Staff.

As a result, the brains of the army, instead of being confined in their activities to the drill of a few men at a frontier post, are engaged at these various educational centers in hammering out the elements of an intelligent and continuous military policy for the United States. We are only just beginning to reap the fruits of this vital change. It was a reform which began at the bottom with the younger officers of the army. It met with much prejudice and opposition at first—opposition which has not yet expired; but its effect upon our army and our national military policy is already manifesting itself in the spirit of intelligent criticism which has been aroused, and as time passes on is sure to be revolutionary in its beneficial effects.

Again, the enlisted man is doing his full share of competent and intelligent work. The requirements of modern military training upon the soldier are constantly increasing. The modern artilleryman, whether in the coast or

field artillery, requires a high degree of technical skill, and must be capable of acquiring it. The American regular is a carefully selected man. We examine at least three applicants in order to get one recruit. And taking him all in all, he compares most favorably with the regular soldier of European countries.

The trouble with the army comes down, therefore, to our own lack of an intelligent policy in dealing with it. An army should be a national organization. It should not be a constabulary. Police duty is a function of local government. To habitually treat the regular army as a police is destructive alike to the army organization and to the local self-reliance of our States.

Nevertheless, we are treating our army today as if it were simply groups of constabulary. The 30,000 men who constitute our mobile forces within the United States—that is to say, our infantry, cavalry and field artillery—are scattered over the country in forty-nine separate posts, each post having on an average 650 men. These posts are not located with reference to density of population, nor with reference to the strategic requirements of national defense, nor with reference to the economical needs of feeding or recruiting their garrisons. On the contrary, some 58 per cent. of the army is scattered over that portion of the country lying between the Missouri River and the Sierras, where there is only a small fraction of our population.

As a result of this, as it has been pointed out in the preceding papers, our army is not only extraordinarily expensive to maintain as compared with the armies of Europe, but its efficiency as an organization has been terribly impaired and hampered. It really has no tactical organization at all. Its men have no opportunity to learn the war game as a matter of team play between the different arms. Its infantry, cavalry and artil-

lery have no opportunity to work in the harmonious unison which modern war requires. Its higher officers receive no training in the handling of large forces of troops. The time and energy of both men and officers is largely wasted on non-military matters of administrative detail involved in the upkeep of so many expensive posts. Soldiers spend their time in watching property, officers in keeping accounts, instead of learning the art of war. And as a result we have produced a scattered police force, instead of a highly trained body of regulars which should be the striking arm of the republic in case of need.

Another effect of our lack of policy in dealing with our army can be briefly pointed out. Our present army, under the legislation of 1901, is organized upon a plan which contemplates its expansion in time of war to over double its peace size. Under the policy of that law we are keeping the army in time of peace at a skeleton strength. A full complement of officers is provided for, but the force of enlisted men as it stands today is only a fraction of the force requisite to fill the regiments and to serve under the established force of officers. As the regiments and companies stand today, they are unfit in size for action. The losses of the first few engagements would put them entirely out of service.

And yet, altho the law thus assumes that these miniature companies will be raised to full strength at the outbreak of a war, there is no machinery provided by which this can be done. We have no provision for a trained force of reserves who could be called into the ranks at a moment's notice on the outbreak of war. Under present conditions we should have to fill up the ranks with perfectly raw recruits, even assuming that such recruits could be instantly obtained. The result is that our first line of national defense in case of a sudden war, instead of being a highly trained regular army prepared to stand off the enemy's onset while our militia and volunteers were being organized, would be a hybrid force whose ranks, if they could be filled at all, would contain over 50 per cent. of untrained men.

The foregoing examples serve to show our lack of intelligent system in dealing with our army. The necessary remedy must come from us as a nation in Congress assembled. Legislation is necessary. And it should not be piecemeal legislation, taken under the impulse of some special motive or demand, but only in the light of the needs of the problem as a whole. For that reason the proposed legislation which has been attached to the current appropriation bill recently passed by the House of Representatives, in my opinion should not be adopted. Instead of being the fruit of harmonious co-operation with the leaders of the General Staff and the War College, it has been forced thru against the urgent opposition of both those bodies. While it contains some features that are undoubtedly good, it contains many that, in the opinion of the leaders of the army, would be extremely bad, and it would only serve still further to accentuate our lack of a consistent and harmonious military policy.

On the contrary, machinery should be constructed to bring Congress into closer touch with our military problems. A bill is now pending before the House of Representatives to establish a council of national defense, containing representatives of both houses of Congress and the heads, both civil and military, of the War and Navy departments. The establishment of some such organization would, in my opinion, go a long way toward insuring a continuous, intelligent treatment of our military and naval problems. Our future legislation should be taken under the supervision of such a body. It should be carefully compared and acted upon in the light of the professional plan of reorganization which is now being prepared and rapidly approaching completion at the hands of the War College. And it must have behind it sufficient public sentiment and popular interest to overcome the selfish opposition of the localities which now profit out of the dispersion of the army.

These are all matters for us. They demand the intelligent interest of the citizen just as much as they involve his ultimate safety and welfare.

WASHINGTON, D. C.

The Soldier or the Ballot in Brazil

BY DAVID LAMBUTH

[The press dispatches have indicated of late that all is not quiet in Brazil, but it is not quite clear just what the situation is. This article is, we believe, the first to appear that explains the situation.—EDITOR.]

THERE'S been a vast amount of criticism, both factious and facetious, poked at South America. "All that Europe knows of South America," says a Brazilian author, "is that it is an enormous continent, thinly populated and given over to innumerable revolutions." Much the same is true of the state of knowledge—or ignorance—in the United States, where the caricaturist seizes upon the most spectacular trait to represent a continent by—that is, its revolutions. This characterization is quite as superficial as ready-made classifications usually are. Revolutions, alas!—to be truthful—they have a plenty and to spare. But saying that the race is capable of nothing better, or saying that these Latin-American republics have not yet worked themselves free from the unfortunate conditions of their birth—these are two very different things. Yet the latter is the real truth.

All these republics are very different in situation and power. But one thing, at least, they have in common. They were colonies conquered, settled and governed by military force instead of being the natural expansion of an industrial, self-governing people. What is more, they are military republics, all of them, made so by the acclamation of an army—with a capital A—which was never a genuine expression of the people so much as a self-sustaining political entity. Now, armies may sometimes be useful, tho there are people who doubt it, but they are very unsafe foundations upon which to rear republics. Rome discovered it. South America is coming to do the same.

To predict that these countries will eventually struggle their way to a truer form of representative government—that they are even now doing it—is quite as safe a thing to do as it would have been, not so many centuries back, to prophesy that the turbulent, individualistic Saxons

and Danes would develop into a peaceful and industrial nation.

As for the republic of Brazil, she has been freer from such disturbances than most of her neighbors, yet recent dispatches have chronicled shootings, riots and threats of revolution all along her 4,000 odd miles of sea coast. What is the meaning of it? Is it satisfactory to say that she is a South American republic and therefore merely indulging her innate love of revolutions?

That is only the caricaturist's way.

In a nutshell, the answer is that Brazil—without always being fully conscious of it, perhaps—is struggling for a more perfectly representative and a more thoroughly centralized interpretation of democratic government.

The United States of Brazil is immense. She is spread out along thousands of miles of seacoast. Communication is not of the best, even today. Transportation has to be measured in weeks. Centralization, therefore, is her most difficult problem. Thruout her whole history overgrown local powers have threatened dissolution. The old Emperor, Dom Pedro II, met the danger by conciliating it and inviting these local leaders to Rio and attaching them and their constituencies to the throne. But under the republic, since 1889, there has been no stern Federal repression. The back of the military power, that made the republic, was broken by the straw of the naval revolt that ended in 1894, and under the four succeeding civilian Presidents the local parties grew readily enough into oligarchies, equally oblivious of the rights of the people and of the interests of the country as a whole. As the police system in Brazil forms a sort of State militia directed by the State government, tho organized as a branch of the army, these local administrations assumed the arrogance of petty princes

under cover of republican forms. With a discredited army, from 1894 to 1910, and with civilian Presidents who feared to wake this happily slumbering dog of war, State oligarchies grew yearly more dangerous to national unity.

Under different aspects, it was still the same old question of State's rights which caused our own Civil War. The federation in Brazil was a loose one and State autonomy had gone too far. How could the situation be remedied without increasing the power of the Federal Government, a cure which, under existing conditions, inevitably brought with it the danger of militarism?

As the result of this question with which the Government was faced there appeared two distinct parties. The Republican Conservative party, dubbed by their opponents *Militaristas*, urged the necessity of a more centralized Federal power, but at the same time seemed to threaten a military domination by their methods. The *Civilista* party, justly remonstrating against the danger of such a policy, allied themselves too much with the State oligarchies and threatened a weakened central Government and a disrupted nation.

At the polls in 1910 Marshal Hermes, of the *Militarista* party, triumphed. The army was awake and again in the saddle. President Hermes has, perhaps rightly, endeavored to increase Federal prestige, but has unquestionably been unfortunate in his methods. When he came to power a struggle was going on in the State of Rio de Janeiro between the oligarchical party in power in the State and the so-called *Opposicionistas*, who were in reality nothing less than State representatives of the Republican Conservative party. A cry of fraud in elections had been raised, and a divided legislature, a portion adhering to each party, was meeting in different cities.

Now, Hermes had taken office with a strong expression of his opinion that the Federal Government was called upon by the Constitution to guarantee the stability and continuity of the State governments in case of internal disturbances which they found themselves unable to quell. In the present case he declared that the troubles in the State capital were endangering the peace of the Federal capital.

which was just across the bay, and that furthermore the *Opposicionista* party, in fighting the oligarchy, represented the rights of the people, this being a logical inference which was scarcely true. So he took the administrative side of the question out of the hands of the delaying Senate, and seated the *Opposicionista* candidate by an exercise of Federal intervention. The intervention was only a show of force and a handful of soldiers, but naturally enough it raised the hue and cry of military domination.

The fat was in the fire. In half a dozen States the *Opposicionistas* (being really the Republican Conservative party itself, in disguise) assumed that the Federal Government was pledged to support them, and began to present opposition candidates, and to create disturbances that might seem to justify Federal intervention.

Now, just in this connection, the history of the republic has got to be remembered. The revolution of 1889 was bloodless and at the same time it was academic—a characteristic combination. That is, it was a revolution by an interested party of politicians and military men—almost identical with those of Portugal—and the people, for the most part, have ever since left to the groups who made the republic the eminent amusement of carrying it on. The people were wise in their day and generation, and besides they were busy doing other things. Until 1909 there had never been more than the one candidate presented for the Presidency. In the State elections there was usually one ticket alone, arranged, of course, by the party in power, and duly declared elected. Who else was there to elect?

The sudden and unnecessary appearance in various States of *Opposicionista* parties very naturally irritated those who had considered local politics a private monopoly of their own, and disturbances, which became all too easily the excuse for Federal intervention, began systematically to occur. In the State of Pernambuco, which lies just below the nose that Brazil sticks out into the Atlantic; in Ceara, which lies a little north of it; in Alagoas, just south; and in Bahia, half way between Pernambuco and Rio, the *Opposicionistas* presented

candidates. In Pernambuco it was Gen. Dantas Barreto, Minister of War in Hermes's Cabinet; in Alagoas it was Col. Clodoaldo de Fonseca, a nephew of the President; in Bahia it was Dr. J. J. Seabra, Minister of Public Works in the republic.

In each case nearly the same thing occurred. The *Opposicionista* leaders, who, it must be remembered, were allied to or representatives of the Republican Conservative party, were mistreated by the State police, who were loyal, of course, to the local oligarchical governments. These local governments either could not or would not provide protection for their opponents, who too frequently stirred up the trouble themselves, and the Federal Government was prevailed upon to step in. These interventions for the sake of guaranteeing the stability and continuity of the existing governments took the nature of selecting from the legal successors of the Governors the first man who gave assurance of loyalty to the Federal policy and establishing him in the chair. Ostensibly the others resigned, and as elections go by mandate of the party in power, the Federal candidates were thus assured election.

Usually the disturbances were not serious. The reports, got up for political ends, greatly exaggerated them. But in Bahia a too zealous general bombarded the city, destroyed the Governor's palace and the public library and damaged some other buildings, and killed a few people. Thereupon a great protest went up from all over the country. State autonomy was threatened. Military domination stared them in the face. Sao Paulo, the most powerful State in the Union, backed by a few others, practically laid down an ultimatum and prepared to fight. The Federal Government recalled General Sotero from Bahia and tried to conciliate.

In the meantime more serious consequences of the Federal activity began to appear. Hermes had gone too far in his policy of centralization by annexation of governorships. The *Opposicionista* parties proposed an ex-Minister of Agriculture as candidate for the gubernatorial chair of Sao Paulo against Rodrigues Alves, who had been the third civil

President of the republic; and in the State of Rio Grande do Sul—the southernmost State in Brazil—Menna Barreto, brother of Dantas Barreto, of Pernambuco fame, having succeeded his brother to the post of Minister of War, was also put up by the *Opposicionistas*.

In both States there were instant explosions. Sao Paulo, already angry and protesting against the treatment of Bahia, sent in an ultimatum, declared that she had the allegiance of the States south of her, began concentrating her troops—which are the best drilled in Brazil—and prepared for war. Having been the home of independence from Portugal in 1822, having been the strength of the Republican movement in 1889, she proved not less firm in 1912. The effect was immediate. The Republican Conservative party saw they had gone too far. In attempting to consolidate they were in danger of hopelessly disrupting. After a "conference," the *Opposicionista* candidate was retired from Sao Paulo; Barreto himself refused to run in Rio Grande, and in Bahia every attempt was made to appear conciliating and strictly legal, tho there the Government had largely gained its point. In the little State of Espirito Santo, where the *Opposicionista* party had also raised the standard of revolt, the Government seemed glad to endorse the candidate of the local group, Colonel Marcondes, and refused to interfere.

This is a mere outline, of course, of what has taken place in the last six months for the most part. Thru it show the ambitions of politicians who are willing to sacrifice the country to their own ends. Yet both parties have reason in their contentions. The *Civilista* party, defeated at the polls in 1909, have struggled against the "army involving itself in the internal affairs of the nation, which is the privilege of the civilian alone." Ruy, the leader of the party, has again and again repeated: "The army which brought about one revolution and tasted the divine pleasures of sovereignty will never more reconcile itself to submission and order." But thru its non-militarism and its alliance with the oligarchical State governments, it lacks the power to hold the separate interests of the States together. It is not

yet, certainly, the strong centralizing power which Brazil unquestionably needs.

On the other hand, the Republican Conservative party, alias the *Militarista* party, masquerading in the separate States as *Opposicionistas*, relies far too much on the dangerous military arm and has proved high-handed, to say the least, in its interference in local politics, however valuable the result of closer union may be. They say they are endeavoring to "shake off the oligarchical yoke which is the corruption of representative government." They are undeniably striving for a more centralized Brazil against the dangerous length to which the doctrine of State autonomy has been carried by the Civil party. Yet they bring another danger as great. "All events have shown," says one of their own leaders, "the impossibility of avoiding the military character which the solution of this institutional crisis must assume."

It is an interesting commentary upon the situation that the same speaker admits, rather reluctantly: "The alliance of the army with the civil power in earlier democratic conquests has brought the country to look upon it as the most efficient aid in the realization of ideas"; adding significantly: "The military character of the revolution of November 15, 1889, was the inevitable result of what had gone before, and the new regime has had to suffer the inevitable consequences."

This constitutional question as to the amount of power to be wielded by the Federal Government and the extent to which a State may be autonomous without endangering the solidarity of the

nation, is one which must be worked out. It took four years of bitter civil war in the United States. It may take the same in Brazil. It has been the disturbing element in national politics for twenty-two years and some months.

The people of Brazil are simple and peace-loving. They have always been so. They want tranquility, and little by little are coming to want also a greater voice in government. But the monarchical habit of having one's government conducted for one is a strong one in sedentary communities. All this while the vast reaches of almost uninhabited uplands and the Amazon Valley, the few railroads away from the well-developed coast rim, and the slow transportation by water along its immense sea frontage—all these make a popular self-consciousness and solidarity extremely difficult.

But revolution for revolution's sake the Brazilian people do not want and are not going to have. The *Civilista* campaign of 1909 and the events of the last six months have had a greater educative value, perhaps, than the whole twenty years preceding. The people themselves are waking to expostulate articulately against the burden and insecurity of militarism. Baron de Rio Branco, who was the greatest exponent of peace in South America, and Ruy Barbosa, *Civilista* leader and peace advocate at The Hague, are the best expressions of the real attitude of the Brazilian people.

The present movement is a passing, perhaps an unavoidable phase, but it is not the end. The end will be the self-consciousness of a peaceful people.

JUIZ DE FLORA, MINAS, BRAZIL.

Possession

BY CARLOTTA PERRY

I'd like it much if everywhere
Life could be like a garden fair;
Yet am I glad fate so disposes,
That 'mid the thorns there are some roses.

I'd like a safe yet valiant steed,
A car of certain make and speed;
Yet am I glad with trusty feet
To walk green lanes and crowded street.

Most surely it would pleasure me
Strange peoples and far lands to see;
Yet anchored at my narrow door,
All seas I sail, all lands explore!

CHICAGO, ILL.

Progressive Democracy

BY ROBERT L. OWEN

UNITED STATES SENATOR FROM OKLAHOMA.

PROGRESSIVE democracy is a worldwide movement, not confined to any State nor to the United States.

It is the natural offspring of the increasing intelligence of the people, due to the printing press. The French Revolution burst the bond of monarchy with the tremendous declaration of "Liberty, Equality, Fraternity." These sentiments inspired the Declaration of Independence and upon them was founded the Government of the United States. The peaceful evolution of a people in comparative liberty has developed in the United States, the most tremendous advancement ever known to the human race. Out of it has sprung an infinite variety of invention. The telegraph, the telephone, modern transportation, a wonderful variety of ingenious machinery for the making of fabrics, metal goods, and every variety of the material things that men and women desire. Out of this development has sprung the modern printing press, thru which the intelligence of the people of the United States has been raised to a point of average intelligence to which no previous part of the world's history bears the faintest comparison. This spirit of progressive democracy is developing democratic principles in Persia and China, and it has reached its highest perfection in Australia and New Zealand and Tasmania.

It accounts for the overthrow of the monarchy in Portugal, for the practical establishment of the most complete democracy in Great Britain and Canada, and in the British possessions, under the form of a limited monarchy. It accounts for the tremendous changes which have taken place in Germany, Austria and Italy. It explains the practical republic which exists in Holland, Belgium, Denmark, Norway and Sweden, under the

form of limited monarchies. In the United States there is rapidly going forward the perfection of the mechanism by which the rule of the people will be established.

Men fully recognize in the United States that so-called "representative government" has to a greater or less degree been diverted by machine politics from its original purpose, and, as some men say, in an exaggerated sense, "Representative government is broken down." In reality, the American people are at heart fundamental democrats, believing in liberty, equality and fraternity.

Naturally, the great commercial interests of the country have taken advantage of the unprotected party government of the United States which the people had failed to safeguard, and therefore the representatives chosen under the delegated form of government, thru the precinct caucus and party boss and the county convention of machine politicians, and the State convention of the selected few, has resulted in the nomination of men who do not really feel that they owe their nomination to the people and therefore do not give complete allegiance to the people. So that there has grown up in this country machine rule government, which forms a convenient agency thru which special interests might easily operate. But with the *mandatory primary* the people were able to nominate their candidates and take power from the hand of the corrupt machine politician. Legitimate organization is recognized by all men as judicious and wise. It is only where legitimate organization is diverted from its true purpose, that is, the public good, the general welfare, to promote selfish ends and corrupt purposes, that it deserves to be stigmatized as "the machine."

The initiative and the referendum enable the people to initiate the laws they do want and veto the laws they do not want. Thru the initiative and referendum alone can the people hope to possess a thoroughgoing corrupt practices act that will overthrow the corrupt machine and its bad practices.

For these reasons the machine men disapprove the initiative, the referendum, the mandatory primary and the recall. The commission form of government carries with it the initiative, the referendum and the recall, and is a part of the machinery of progressive democracy.

Nearly two hundred of the great cities of the country have adopted, within the last three years, this reform, and many of them using the preferential vote, with first, second and third choice, which is another part of the machinery of progressive democracy, by which the people can nominate a successor to any public servant in whom they have lost confidence.

The Test of Progressive Democracy.—Whenever a man expresses his lack of confidence in the majority of the people, whenever he says that it is not safe to trust the body of the people, that they are moved by sudden impulse and passion, that they are misled by popular clamor, and speaks of the people as if they were a mob unworthy of trust, that nominal democrat needs to examine anew his democracy to ascertain whether in fact he believes in the fundamental democracy, that is, in liberty and equality, whether he believes in "equal rights for all."

The Initiative and the Referendum.—The initiative and the referendum has just been voted on by California and carried by three to one. Oregon adopted it over ten years ago. It has now been adopted by South Dakota, Oklahoma, Oregon, Missouri, Maine, Montana, Arkansas and Colorado. Nevada has the referendum and will vote on the initiative next year, and without a shadow of a doubt will adopt it. Nebraska, Washington, Wyoming and Wisconsin have had the initiative and referendum submitted for popular vote. The result no sane man doubts.

North Dakota, thru its last Legis-

lature, has adopted the necessary resolution to submit the initiative and referendum to the next Legislature. Arizona has already adopted it in its Constitution. The people of Illinois voted for it by over three to one. No man doubts that it will pass the Ohio Constitutional Convention and be adopted by that State. It is a pressing issue in Kansas, Indiana and Texas.

The Legislature in Indiana has submitted the draft of a new Constitution, authorizing the Legislature to establish the initiative and the referendum.

It is an active issue in Maryland. It was submitted to the people of Florida by the recent Legislature. Upon this issue, Berry in Pennsylvania, in a short campaign of four months, received 384,000 votes, and it is believed that but for the unfair count of the political machine he would have swept Pennsylvania on this issue. Eugene V. Foss carried Massachusetts with this as one of his declared planks, and thruout the Union it is a surging, powerful sentiment which is sweeping the country.

The mandatory primary, the initiative, the referendum and the recall, the government of municipalities by commission, the preferential ballot, the right of the people to nominate the President and Vice-President directly, the publicity of campaign contributions before elections, are all parts of the purpose of the people to restore direct power to the people in order that the people may have power to protect themselves against the graft of those who have usurped the governing function for private ends.

The Recall.—California voted for the recall by over three to one. Arizona declared for it. Oregon has it, and recall of the judiciary is provided for in the most extraordinary way by the various States of the Union. Forty-eight States have two ways of recalling judges, impeachment being one way, automatic recall by a fixed tenure and a legislative recall by act of legislature being the other. Thirty-five States have three ways of recalling judges, and three States have four ways, including Arizona, for obvious reasons. There is no power in either party that can stop the growth of progressive democracy.

The development of the Progressive

Republicans inside of the Republican party is the best evidence of the growth of this sentiment. There need be no fear whatever of the rule of the people. They are more conservative than their

progressive leaders. They move slowly, very slowly; they are wise; they are sane; and they are benevolent in their judgments.

WASHINGTON, D. C.

The Argument of Broken Windows

BY ANNIE G. PORRITT

MUCH of the condemnation which has been freely poured upon the militant section of English suffragists is lacking in force and applicability because there is behind it no clear comprehension of the real character of the movement and of the aim and policy of its leaders. Such adjectives as "emotional," "unbalanced," "hysterical" are frequently applied to the women who for six years have been using militant methods to bring about the enfranchisement of their sex. Such adjectives are certainly inapplicable to women who form a disciplined force, which renders instant obedience to the commands of its trusted leaders. Every move in the militant campaign has been planned beforehand. Volunteers are called for, when danger duty is required, and on every occasion on which the women have gone to jail after a raid it has been determined beforehand in the councils of the party who shall be the victims and by what means they shall bring themselves within the clutches of the law.

On the 17th of June, 1911—the day of the magnificent Women's Coronation procession in London—a truce was declared by the Women's Social and Political Union, on the faith of Mr. Asquith's pledge that ample time during the next session of Parliament should be allowed for all stages of the conciliation bill, a bill which would have conferred votes upon about one-twelfth of the women of England. With the declaration of the truce every trace of militant action disappeared, and tho there was much cause for irritation before the truce came to an end, on November 18, not a sin-

gle woman in the ranks of the W. S. P. U. gave any occasion for an accusation of breach of faith. The end came to the truce after Mr. Asquith had announced that the Government would bring in a manhood suffrage bill in the present session of Parliament—an announcement which, in the words of Mr. Lloyd George, "torpedoed the conciliation bill." A great deputation of women, composed of representatives from every woman suffrage association of Great Britain—peaceful and militant—went to Mr. Asquith on November 17 to ask the inclusion of women in the bill for manhood suffrage. They were met by the Premier with a rude rebuff. "I am the head of the Government," Mr. Asquith then asserted, "and I am not going to make myself responsible for a measure which I do not believe to be demanded in the interest of the country."

Tricked out of the conciliation bill, and refused a place in the great new reform measure of the Liberal Government, the W. S. P. U. publicly proclaimed the truce to be at an end, and on November 21 over two hundred women were arrested and sent to jail for breaking windows—at that time almost entirely of government buildings. The breaking of windows is not usually considered a pleasing or lady-like act, and the women who did it are not the kind of women whom one would associate with the acts of mere hooliganism. The women of the W. S. P. U. in prison for the most recent raid—that of March 1—include the octogenarian widow of General Brackenbury and her two daughters; Mrs. Saul Solomon, widow

of the South African statesman who was of so great assistance to Lord Milner in bringing the Boer war to an end; Dr. Ethel Smyth, one of the foremost English musical composers and daughter of General T. H. Smyth, C.B.; Mrs. Pethick Lawrence, Dr. L. Garrett Anderson, and Mrs. Gurney and Mrs. Tuke, both of prominent Quaker banking families well known for generations of philanthropic workers.

It is not for nothing that women of this standing rise in revolt and take to actual fighting, accepting the certainty of grievous casualties in their struggle against overwhelming odds. Before they can be condemned or swept aside as hysterical Mænads, two questions should be asked and answered: First, is the cause for which they are risking life and liberty worth fighting for; and second, is their plan of campaign likely to lead to victory?

The first question answers itself to every liberty-loving son of the Anglo-Saxon race. To assert that liberty and self-government are not worth fighting for would be to stultify the whole history of England and America. Is there a son or a daughter of the Revolution in this country who would dare to condemn the action of the American colonists in opposing the tyranny of King George III and his ministers, or can one find an Englishman who condemns the struggles by which the English nation put a limit to the power of its kings, and won the right to make and administer its own laws? What men won long ago—not without bloodshed and much destruction of property—women are now demanding; and a cause, which has always been considered sacred, cannot now be judged ignoble or of no account.

It is the second question to which Americans find it difficult to return an answer favorable to the women. How can breaking windows and going to jail be effective in bringing about the enfranchisement of women? It may be remembered that the revolt of the American colonists began with an act of wanton destruction of private property. The Boston tea-party has always been considered in the light of a warning to the English Government that the colonists would not submit to taxation without

representation, and had the King and ministers been wise enough to heed the warning, much bloodshed and misery might have been avoided. The whole course of English history is a series of similar warnings from people, who were shut out from share in the government, that their patience had reached the breaking point, and that it behooved the Government to hearken to their demands. Never have the English governing classes parted with any of their power or their privileges so long as they could count on patient endurance by the people under their rule. The speech of the Right Hon. C. E. Hobhouse—himself a member of the territorial aristocracy—at Bristol in February, which has been seized upon by the English press as an incitement of the women to violence, did but allude to two well-known episodes in the long fight for votes for men. "In the case of the suffrage demands," said Mr. Hobhouse, in an effort to prove that women did not really want to vote, "there had not been the kind of popular sentimental uprising which accounted for Nottingham Castle in 1832, or Hyde Park railings in 1867."

The riot at Nottingham, during which the castle of the Duke of Newcastle was burned to the ground, was one of the incidents that were necessary to prove to the governing classes in 1832 that the unrepresentative character of the House of Commons had become intolerable. Bristol, where Mr. Hobhouse made his speech, was also the scene of riots, during which the Bishop's palace similarly went up in flames. The destruction of private property was the convincing argument of men who wanted to be admitted to the franchise, and the House of Lords—then the obstacle of reform—admitted the validity of the argument and passed the Reform Act of 1832.

It was a similar story in Canada in 1837. It took the Papineau rebellion in Quebec, and the MacKenzie rebellion in Ontario, to win self-government for Britain's remaining North American colonies. The incident of the tearing down of a mile or two of Hyde Park railings clinched the argument for reform in 1867, and induced the classes in possession of political power to admit—grudgingly and inadequately—some of

the working men of Great Britain to the franchise. Threats to end the House of Lords were necessary to induce the aristocracy to enlarge the franchise a little further in 1884, and to let several million more of the working men into the represented classes.

All this time—ever since the introduction of the first measure for woman suffrage in the House of Commons by John Stuart Mill in 1867—the women had been quietly urging their own cause. Education, persuasion, peaceful agitation were carried on persistently and patiently for forty-five years. Again and again it was conceded by ministers and members of Parliament that so far as argument was concerned the women's case was won; that there was no necessity for further educational effort. The House of Commons had shown its opinion of the justice of the women's cause by repeatedly giving large majorities to bills conferring the suffrage on women. But the question was not considered urgent. It was commonly spoken of as a "merely academic question," and according to English tradition, there was only one way by which Votes for Women could be raised from the academic stage into a vital political issue. This way was to force it upon the attention of the Government which happened to be in power by some form of violence; to convince Cabinet ministers that the women of England had withdrawn their consent from a government in which they had no share, and that there were only two courses open to the authorities—repression, with continually increasing severity toward the rebels, or the concession of the right of self-government.

So far the Cabinet has chosen the first alternative. The ministers have been unmindful of the fact that "the blood of the martyrs is the seed of the Church." They have endeavored to crush out heroism and self-sacrifice with the crude weapons wherewith men try to repress crime. They have not comprehended the spirit or the quality of the women to whom in the early days of the struggle magistrates served out sentences of un-

exampled severity for actions that certainly could not be called crimes. The authorities have met hunger strikes with torture, and protests with manacles and punishment cells. Now that the women have taken a further step in procedure and have broken windows, instead of offering themselves for arrest by their persistent efforts to pass the cordons of police that guarded the Houses of Parliament, the Government is resorting to the clumsy and outworn conspiracy laws—in the hope that a weapon which was quite ineffective in crushing out agitations of men may be sufficiently powerful to bring to an end the revolt of the women.

In the meanwhile, no Liberal Government or Liberal Cabinet minister can engage for years in efforts to crush down a movement for liberty and self-government without paying a tremendous price in loss of prestige and of principle. The Cabinet which in 1906 was backed by the largest Parliamentary majority of modern times is now in an actual party minority in the House of Commons. The ministers are divided; and the theory of Cabinet solidarity received a rude shock when members of the same Cabinet openly appeared on the platform on opposing sides of this great question. Whether immediate enfranchisement crowns the efforts of the women or not, the militant action of the W. S. P. U. has resulted in making of woman suffrage not an academic question, the solution of which would be indefinitely postponed, but the most vital and disturbing political issue of the moment, and the issue which must be settled before peace can be restored to the nation—peace resting on the only sure basis of democratic government—the consent of the governed. So much has already been effected by militant tactics, and the present panic of the English Government—the resort to extraordinary means of repression—is good proof that the Liberal ministers are not under any impression that the W. S. P. U. is a mere aggregation of hysterical Mænads.

Panama Canal Tolls

BY LEWIS NIXON

[Mr. Nixon, soon after his graduation at Annapolis, resigned from the Navy to become superintending constructor of the Cramp Shipyards at Philadelphia. He resigned that position, however, in 1895 and started the Crescent Shipyard at Elizabeth, N. J., where he has built over 100 ships. He has taken an active interest in politics and succeeded Richard Croker as leader of Tammany Hall in 1901, which position he had one year.—EDITOR.]

WHILE some of our people are against proper measures for rehabilitating our merchant marine in the foreign trade from ignorance, others from foreign interest, and others from taking their opinions from men who oppose such rehabilitation, the great bulk of our people earnestly desire to see our flag afloat as it was in the past.

As our people realize that we are drifting more and more into hopeless dependence upon foreign vessels, their interest in this most important subject will become greater. But while a general understanding of the subject is vigorously combated by our trade rivals thru the spread of misinformation and thru questioning the motives of those who are doing what they can to bring back our flag in our foreign trade, progress is slow, and in the meantime the shackles of foreign control are being riveted faster.

The exchange of commodities upon the ocean will double within the next twenty-five years. If we suffer our various products to be interchanged solely thru the medium of transportation systems foreign to our control, such systems will be able, after portioning out our trade to their self-interest, to inflict inferior service at disadvantageous rates.

There is forming an ever strengthening control of our carriage in the ships of another hemisphere. With such increase unchecked there is building up a system powerful enough to replace competition by dictation.

With buying, selling, banking, insurance and transportation developed to a degree that defies successful or possible exercise of such factors of commerce by ourselves, we shall be reduced to the position of simple producers and consumers, giving of our labor and resources to enrich alien peoples.

In many cases the disposition and price received by the producer are fixed by the carrier, so essentially necessary are trade connections and distributive agencies to the great maritime fleets of the present day, and such powers are of course used, and properly, whenever possible, to advance the material interests of their respective countries. So long as the pools, conferences and countries of another hemisphere control inter-American trade, they can keep the transportation charges in our trade such as they ordain, and can continue to throttle the flow of trade to our disadvantage.

To pay charges connected with our foreign commerce there is an outflow of gold of over \$300,000,000 a year.

While our public now get red in the face discussing the tariff, they treat with indifference a condition which taxes us to a greater amount than we collect at the custom house.

So long have we been indifferent that only drastic and compelling measures will prevail. We cannot regain our rightful share of our own carriage without displeasing others who now think they are in possession of vested rights in our commerce.

We must prefer our own vessels in every proper way to meet the ruthless opposition of those who oppose every and all of our measures except surrender.

Among other aids would be a preference for our own vessels in Panama Canal tolls.

Of course, this is opposed, or if done, it must be done in a roundabout way to suit foreign nations, that they may the more easily remove the handicap.

But they want us to do nothing. Things as they are being so decidedly for foreign advantage and our undoing, every effort is made to block preferential legislation.

The simplest way among others was to

say that the Hay-Pauncefote treaty forbids.

Of course, when the treaty is shown not to forbid preference for our own they will furnish other arguments with no more foundation, but proving beyond question that Barnum's saying about the American public has been elevated into a working European doctrine.

Let us quote from the treaty:

Article I:

"The high contracting parties agree that the present treaty shall *supersede* the Convention of 19th April, 1850." (Clayton-Bulwer Treaty.)

Article II says the United States Government shall enjoy

"the exclusive right of providing for the regulation and management of the Canal."

Article III, Section 1:

"The Canal shall be free and open to the vessels of COMMERCE and of WAR of all nations observing these rules on terms of entire equality, so there shall be no discrimination against any such nation, or its citizens or subjects, in respect of the conditions or charges of traffic or otherwise."

This is all that is usually quoted, and conclusions adverse to us are drawn.

But let us quote from Section 2, Article III:

"The Canal shall never be blockaded, nor shall any right of war nor any act of hostility be committed within it."

Section 3, Article III:

"Vessels of war shall not revictual nor take any stores in the Canal except so far as may be strictly necessary, and the transit of such vessels through the Canal shall be effected with the least possible delay in accordance with the regulations in force."

Section 4:

"No belligerent shall embark or disembark troops, munitions of war or warlike materials in the Canal."

Section 5 of Article III:

"The provisions of this article shall apply to waters adjacent to the Canal, within three marine miles of either end. Vessels of war of a belligerent shall not remain in such waters longer than twenty-four hours at any one time, except in case of distress, and in such case shall depart as soon as possible; but a vessel of war of one belligerent shall not depart within twenty-four hours from the departure of a vessel of war of the other belligerent."

No one can read Article III except thru glasses distorted by foreign sym-

pathy and possibly construe such plain statements in any way than that we are to open the canal

"to the vessels of COMMERCE and of WAR to all (*other*) nations on terms of entire equality."

All, I think, will admit that the constitutional authority for building the canal exists in the war power of the United States. Two Presidents have confirmed this view in their statements that this canal is an addition to our war power in that it admits of quick transfers of our naval forces from one ocean to the other.

Yet foreign contention is that under Section 1 of Article III of the Hay-Pauncefote treaty we cannot discriminate in favor of our own commercial vessels, and that, therefore, we cannot do so in favor of our own war vessels, and that if during war with a foreign power we find an enemy's ship in the canal, we cannot drive it out, and if it leaves such waters we must wait twenty-four hours before giving chase, and in view of the fact that we exclusively provide "for the regulation and management of the canal," if any of our men-of-war find themselves in the canal when we are at war, they must chase themselves out.

The treaty, of course, means that we are in the management of this canal built with our money and in territory under our sovereignty and flag, and as managers we are to treat the vessels of war and commerce of other countries all in the same way.

My personal opinion is that this treaty should be abrogated, even tho not in any way preventing the preference of our own vessels, on the score of the infringement of sovereign rights and violation of the Monroe doctrine.

With this treaty out of the way we could include in our preferential treatment the ships of the other republics of the Western Hemisphere and make of Pan-Americanism a binding force and enduring benefit to the nations of this hemisphere.

To show how misinformation takes root, thru the large measure of foreign control of American public opinion and thought, I will quote from an article by Mr. John F. Wallace, former chief engi-

neer of the Panama Canal, who says in *Waterways and Commerce* for March:

"It is folly to talk of discriminating in favor of American shipping by special rates or rebates granted to American bottoms. In the first place this situation was foreseen by Great Britain when the Hay-Pauncefote treaty was concluded and this point well guarded in the interest of British commerce."

He further says that at a dinner attended by him an Englishman of high rank said to him:

"Wallace, civilization is to be congratulated that the United States is constructing the Panama Canal for the benefit of British commerce."

And he accepts an impossible British interpretation of a treaty, and, perfectly contented, thinks if even we had been tricked we should manfully assert our rights.

And an attentive reading of his article, so much like many others being circulated, discloses that his remedy is to knock down the few remaining barriers we have left to protect our marine from annihilation.

This idea that to revive our marine we must destroy it loses sight of the fact that in the reincarnation we should not have the Stars and Stripes at the stern.

NEW YORK CITY.

The Three Religions Conference

BY GALEN M. FISHER

SECRETARY OF THE TOKYO Y. M. C. A.

THE conference of the representatives of Buddhism, Shinto and Christianity, on February 25, 1912, was a significant event. It is likely to be looked back to as one of the most important events since the proclamation of freedom of conscience in 1889. The prime mover in the whole matter has been the Vice-Minister for Home Affairs, Mr. Tokonami. His tour thru Europe and America in 1909 resulted in the conviction that religion is an indispensable and powerful factor in national life. He embodied his conclusions, early in 1910, in a book which has attracted considerable attention. Ever since then the matter has been upon his heart.

Beginning in the spring of 1911, he secured the approval of a number of important religious leaders, including Christians, and also won the support of the elder statesmen. There were, of course, many vehement opponents to the plan to hold such a conference, but he plowed steadily ahead and results already have justified his wisdom.

The conference itself was held under the auspices of the Home Minister, who made a brief address to the seventy rep-

resentatives present, wisely avoiding any detailed proposals.

The motives underlying the plan are, I believe, just what Mr. Tokonami has publicly given or implied by his statement. Namely, first to steady and elevate public morality, which has been disintegrated by the inrush of materialistic thought from the West and the breakdown of the older standards and faiths. Included in the uplift of morality was the stimulation of loyalty to the Emperor and the state. No doubt some of the officials supported the plan chiefly because they believed it would buttress what may be called the conservative wing, but I think it is entirely unjust to construe the plan as being a bribe to religionists to support the *status quo* regardless of the acts of the Government. It is doubtless true that one indirect result will be to rally all serious-minded subjects even more devotedly to the support of the state and the Imperial House, but surely no one could find fault with such a result so long as the Government is just and so long as the religions are not fettered in speech, creed or organization.

The second motive, not explicitly stated by any official, was to counteract the unfortunate effect of the order of the late Minister of Education a year ago, which instructed the school teachers to encourage ancestor worship and faithful visits to public shrines. That order led to breaches of the spirit, if not the letter, of the "freedom of conscience" clause in the Constitution, and irritated not only Christians, but other liberal-minded men.

The third purpose was to give Christianity recognition as a reputable and established religion of the Japanese people, thus making public amends, as it were, for the suspicion and unfair treatment of Christianity in the past.

It is a cause for gratitude that Mr. Tokonami and the present Cabinet were wise enough to avoid any attempt to combine the three religions, or to establish a state religion, or to interfere in any way with the internal affairs of any of the religions.

The greatest gainer from the conference is unquestionably Christianity, both because it has been under the greatest suspicion and disability, and because it has the most vitality to take advantage of the newly opened opportunities. One of the offshoots of the conference arranged by the Government was a banquet arranged by leading educators, which was attended by two hundred prominent religionists, about one-third of whom were Christians. The after-dinner speeches were calculated to promote fraternal feeling between the representatives of the three faiths, while at the same time the Christian speakers made it plain that they did not abate at all their convictions of the finality of Christianity.

A little later the executive of the Japanese Church Federation adopted three resolutions, the gist of which is as follows: First, we shall exercise ourselves to treat the representatives of the other two religions with courteous consideration, but shall stand firmly upon the substantial and distinctive truths of Christianity, and exert ourselves as never before for moral reform and the national welfare.

Second, we believe that government, education and religion must go hand in hand, but we shall strive to show more clearly the respective functions of the three and the fundamental authority and power of religion.

Third, the spiritual needs of the nation summon us to more aggressive efforts for Christian evangelization.

The results of the conference and its accompanying meetings will only work themselves out gradually, but in view of the fact that nearly everything in Japan works from above downward, it is probable that the general attitude toward Christianity will be more favorable than for two decades past. All that the Christians desire is a fair field and no favor; in other words, a thoroughgoing application of the "freedom of conscience" clause in the Constitution in spirit as well as in letter. The Christian leaders seem to realize that it is no time for them to indulge in denunciation or controversy, or to exult in the real victory which has come to them. They seem resolved to adopt Lincoln's motto, "With malice toward none and charity for all, and courage for the right as God gives them to see the right," to press the Christianization of Japan with more vigor than ever before.

TOKYO, JAPAN.

An Adventurous Life

THOSE who have only known or heard of Mr. H. M. Hyndman as a pestilent agitator and sanguinary revolutionist will be surprised, on reading the entertaining record of his richly adventurous life,* to discover that the founder of the Social Democratic party of Great Britain is a man of wealthy ancestry, high education, wide culture, amazing energy and unusual literary power. The most interesting part of the memoirs to the general reader will be the intimate account of George Meredith, Mazzini, Karl Marx, William Morris, Clemenceau and other men of might, the sidelights flashed on European history, and especially the stories of life in Italy, Australia and Polynesia before the middle of the nineteenth century. The whole record is given with liveliness, with humor and with a vigor that helps to explain how this *enfant terrible* of British political life has managed to survive the hatred of foes, the dissensions among friends, the blunders of comrades and the lethargy of the masses.

Probably Mr. Hyndman himself considers the portion of most value to mankind is the history of the birth and growth of the Socialist political movement in England, to which he was midwife and nurse. Starting as a rich young man, with all the advantages of education and travel that the world could afford, bound by ties of blood relationship, of delightful friendships and of material interest to the ruling classes, he yet seems by nature to have been a rebel. His own powers of analysis and logic and his unusual independence of thought had enabled him early to detect the hollowness of most political party pretenses; his observation of the squalor, ignorance, filth and wretchedness in working class quarters of England had shocked his humanity and patriotism. Therefore, when he studied Karl Marx's great work on "Capital," he readily digested the

strong meat of the word, and, once for all, became a thoroggoing Socialist.

On his return to London, after the most agreeable experiences among Americans, of which he writes with kindly appreciation and gratitude, Mr. Hyndman started, in 1881, the Democratic Federation. His program for the movement, set forth in "England for All," scared away a number of the well-to-do, who were ready for more democracy, but not for socialism. Soon after the baby organization was rechristened the Social Democratic Federation and advocated full-blown, uncompromising socialism. Accessions came slowly. Critics declared that "Mr. Hyndman persisted in calling himself the Social Democratic Federation." But a party that included, in 1884, Bernard Shaw, William Morris, Annie Besant, John Burns and Edward Aveling would soon have had a power out of proportion to its numbers but for one fatal defect. Dissensions broke out. First, the Fabian element, protesting that Mr. Hyndman was unendurably dictatorial and *intransigent*, flocked by themselves and founded the society which has been more influential and famous than the parent organization. Next, William Morris and a number of his admirers swarmed off and settled in a new hive—only, however, after a few years of comparative impotence, to languish and die. Nearly every person of special ability has departed from the Social Democratic Federation.

Mr. Hyndman says that the dissenters were either cantankerous or treacherous, and that he, the founder, was uniformly reasonable and amiable, tho determined to keep the flag of working-class revolt flying high before all foes. On this point he is not an unprejudiced witness. Among most Socialist groups he is considered, even today, as a dogmatic, self-willed, intractable "comrade," an impossible leader, tho sincere and incorruptible. Certainly he did not go untempted. English Tories, to whom politics is the most absorbing of games, have a thousand devices for seducing an able enemy. To

*THE RECORD OF AN ADVENTUROUS LIFE. By H. M. Hyndman. New York: The Macmillan Co. \$1.75.

the high honor of Mr. Hyndman be it said that now, in his old age, he is partially impoverished and as uncompromising as ever. Whether it is equally to the credit of his judgment that, despite his unusual gifts, he has never won his way into the House of Commons, is more doubtful. Practical life, and particularly political life, is a succession of compromises. The man or the society that will concede nothing and demands everything is apt to find the road impassably rough.

Some Books of Verse

OF books of verse on our desk today John Carter's *Hard Labor and Other Poems*¹ easily takes the lead in realistic song. Imprisoned at nineteen for a term of ten years because of a burglary committed under stress of want, the poet's prison songs bear all the marks of a thinker and singer of power—a caged bird of song. Love in retrospect, friendship living yet lost, the restiveness of action in the heart but denied to the hands, heaven and the stars, earth and its joys, felt only in glimpses—these are his themes, and he treats them in many moods, the imagination working now in scorn, now in passionate hate, but always on a basis of agonizing, bewildering fact which excludes all mock sentiment. One can hardly read these poems without tears.

From such realism without sunshine we turn to a hard-working physician, Francis Gray Ticknor,² who no longer walks the wards of a Southern hospital, begging now and then a sheet of white paper that he may jot down a happy thought for the fireside verse; no longer jogs on his gray mare over the wasted roads of Georgia, whipping out a prescription pad that he may preserve an image of bravery and heroism suggested at the last bedside he has visited in his daily rounds. His poems, now first collected, bear concrete evidence of a man of action, tho not on the field of battle. Some of his lyrics for their vitality and charm deserve a high place among war ballads—a place not to be denied them tho the

spirit of the cause they celebrated, and its heroes, have ceased to represent the ideals for which the Puritans and Cavaliers of all the old thirteen colonies fought. His valiant verse may surely speak for loyalty to ideals that live ever in the American heart. "Little Giffen" and "Barbara Frietchie" may well stand for the silver and gold on the shield whose two sides faced two halves of a great conflict of ideas.

Of the many physicians who have found heaven in poetic composition, Dr. James Newton Matthews³ may be counted as one of the worthies, despite a rather excessive laudation of him by his admiring editor, who declares that his poet's collected verse "should be reared in a pile to overtop the pyramids." One may safely place the poet among the hearty, jovial, healthy-spirited singers whom it would be good to have at the bedside in sickness and at the fireside over a pipe in the evening. Going the rounds of the doctor, like Ticknor, Holmes, Weir Mitchell and many a cheery disciple of Galen, he found his compensation not perhaps in a lyrical use of the prescription pad, but by the fires of a friend, when the saddle-bags had been put away. A sanitary love for the neglected, the misprized, appears in his verse. He loved his pipe, his hours of ease with a brother poet, but he loved the heroic in man and woman, and sang it well in such spirited and sympathetic verse as "Little Goggles" and "The Coward"—the poor coward Dave, who

"Came to the war on the first wild wave
That billowed the blue-caps over the land."

How happy a figure that is! And what a taking lilt has the verse that runs genially along common but glad lines, like those royal stanzas on "Charlie Gibbs":

"Now take an' size 'im up an' down—I mean
this Charlie Gibbs,—

An' w'en ye've measured round his head,—
w'y, reach around his ribs

An' feel his happy heart a-beatin' time to all
he sings,

Like a medder-lark in Aprile, with the morn-
in' on his wings

An' warm yer han's agin his blood a-scamper-
in' along

Like a crick ferever flowin' in the summer uv'
his song."

¹HARD LABOR AND OTHER POEMS. By John Carter. New York: The Baker & Taylor Co. \$1.

²THE POEMS OF FRANCIS GRAY TICKNOR. Edited and Collected by His Granddaughter, Michelle Catho Ticknor. New York: The Neale Publishing Company \$2.

³THE LUTE OF LIFE. By James Newton Matthews. Edited by Walter Hunt. Cincinnati: Horton & Co \$1.50.

Few more beautifully suggestive pictures have been drawn in recent poetry than are the *Moods, Songs and Doggerels* of John Galsworthy, novelist, dramatist and poet.⁴ One of the moods may fairly give the spirit pervading them all. "The Seeds of Light" the poem is called.

Once of a mazy afternoon, beside that southern sea,
I watched a shoal of sunny beams come swimming close to me.
Each was a whited candle-flame a-flickering in air;
Each was a silver daffodil astonished to be there;
Each was a diving summer star, its brightness come to lave:
And each a little naked spirit leaping on the wave.

And while I sat, and while I dreamed, beside the summer sea,
There came the fairest thought of all that ever came to me;
The tiny lives of tiny men, no more they seemed to mean
Than one of those sweet seeds of light sown on that water green;
No more they seemed, no less they seemed, than shimmerings of sky—
The little sunny smiles of God that glisten forth and die.

The poems are all short, pithy, containing only a single thought, a bit of taking landscape with a human attachment, a reminiscence—but all are finished with care, and share in the quaint English outland, moor-like atmosphere to which every English poet loves to escape.

In a *Sheaf of Poems* Mrs. Kiliani⁵ has gathered and reprinted, along with various translations of her own, many versions, either uncollected or out of print, made by her father, Bayard Taylor, and scattered thru his many essays on German and French themes. As in his admirable translation of "Faust," he resolutely refused to reshape his originals as to rhythmical forms or to give an English inspiration to a theme essentially German, so the daughter, taking her cue from her father, has made some notable renderings from the poets of an alien mood, from Goethe and Schiller, from Victor Hugo, from the Minnesingers. How strong they are, and how vivid with the color and spirit of the originals, may

be best seen in her version of Goethe's "Prometheus" and his "Nearness of the Beloved." Tho sometimes inattentive to the demands of the critical reader, who would take exception to some of her un-English inversions, the translator has made a real addition to the library of song.

Invention rather than imagination has full play in Cara E. Whiton-Stone's *In a Portuguese Garden*.⁶ A high verbal strain that hardly carries conviction either to the understanding or to good taste in poetical selection, is too much in evidence. In a series of thirty-one sonnets, the key is set by such verse as this:

"And ere thou knowest summer will be gone
And melodies ethereal, note by note,
From souls of pines will down the immenses float

And then be into new immenses born:
And thou wilt see the splendors of the morn
Melt into gaugeless blue, and hear, remote
Down from the sun's heart, from an eagle's throat

The revelation of its superb scorn."

This is song on stilts, that goes slow and hardly keeps up with the pace of far less ambitious rimesters, content to use their natural legs. The author has much better stuff in him.

The courtship of Psyche by Eros, the marriage and subsequent discontent of the bride with her day-long absentee husband, whose duties in the "everywhere" limit his hours of ease and dalliance in this world—is the theme which Francis Coutts⁷ pursues in luxurious verse, with somewhat of the freedom of the Elizabethan poets, up to the point where the soul, "housed in the handsome dust," is persuaded to be as happy as she can well be, until, divested of the handsome dust, she can become happy in the "everywhere" herself.

Syndicalism

IN our editorial columns this week we discuss the philosophy of syndicalism, and it is well to mention here a few books on the subject, for this new form of the labor movement, which now threatens to become dominant, has risen so rapidly that it is not easy to keep track of it.

⁴MOODS, SONGS AND DOGGERELS. By John Galsworthy. New York: Charles Scribner's Sons. 1912. \$1.

⁵A SHEAF OF POEMS. Translations by Bayard Taylor and Lilian Bayard Taylor Kilani. Boston: Richard G. Badger. The Gorham Press. \$1.50

⁶IN A PORTUGUESE GARDEN AND OTHER VERSE. By Cara E. Whiton-Stone. Boston: Sherman, French & Co. \$1.50.

⁷PSYCHE. By Francis Coutts. New York: John Lane Company. \$1.25.

Most of the literature is in French, where syndicalism first assumed definite shape and became articulate, but the English reader may refer to the timely volume on the syndicalist movement, written by Sir Arthur Clay.¹ Altho the book is largely devoted to arousing the British workingmen and public to the dangers of syndicalism, the account of its history and aims is fair enough and gives a general survey of the progress of the movement in various countries in recent years, such as is not to be obtained elsewhere in so convenient a form.

The metaphysician of the movement is M. Sorel, who has constructed an elaborate system of philosophy in justification of "direct action," including violence and sabotage, expounded in three volumes,² and a monthly review, *Indépendance*. An elaborate and careful study of the whole subject has been made by M. Challaye.³

But the general reader will probably prefer the compact exposition and criticism of *The Syndicalist Philosophy*,⁴ by M. Guy-Grand. The especial value of the book lies in the care the author has taken to show the relation of this industrial movement to the various moral and philosophical tendencies of the times, such as the present conflict between intellectualism and mysticism, the revival of paganism under the influence of Nietzsche, and in particular the other attack, which is now being made against the republic from the opposite quarter, from the Nationalists. M. Guy-Grand devotes another of the handy volumes of the *Etudes contemporaines* series to the philosophy of the Nationalists, who favor Church and King, tho personally they believe in neither, and who bitterly hate all Jews, Protestants and foreigners, especially Germans.

The Modern Woman's Rights Movement.

By Dr. Kaethe Schirmacher. New York: The Macmillan Co. \$1.50.

Dr. Schirmacher has made a historical survey of the woman's rights movement

in all countries of the world, with the usual painstaking German accuracy. The rise of the movement in America dates from 1848, the year of general unrest in Europe and of much revolutionary activity, and from that date to the present Dr. Schirmacher has allowed few important facts to escape her vigilant research. She speaks of Germany with authority, and it is interesting to see just how a German woman of unusual gifts feels concerning the subjection of women in her native country. She is too dignified and scholarly to rant about it, but there is an air of quiet determination in her discussion, which bodes ill for the authority of the German man when the mass of women reach the author's conclusion:

"In no European country has the woman's rights movement been confronted with more unfavorable conditions; nowhere has it been more persistently opposed. . . . Educating is always a slow process; but it inspires limitless hope. The movement hopes to secure the happiness of woman, of man, of the child and of the world by establishing the equal rights of the sexes."

Charles Dickens as Editor: Being Letters Written by Him to William Henry Wills, His Sub-Editor. Selected and Edited by R. C. Lehman. With Portraits. New York: Sturgis & Walton Company. \$3.25.

For more than twenty years Dickens, in addition to his many literary and other activities, served the reading public successively in three distinctly high-class periodicals. He was one of the founders of the London *Daily News* and the chief of *Household Words* and *All the Year Round*. His chair as editor was a movable one; sometimes it was altogether peripatetic; yet, wherever it was, the editor-in-chief handled the literary material in its final polish—handled it often without gloves, tho preferably with a tender touch for modest worth. Many an article by a friend, by a promising fledgeling in letters, by a bungler, by some thusy-musy head like that on the shoulders of his friend Leigh Hunt, whose Harold Skimpole days were already down in fiction, got the illuminating flash thru the kindness of the editor, who seems to have sat up nights rubbing in the electric fluid and readjusting the facts. "Nothing can be so damaging to *Household Words*," he

¹SYNDICALISM AND LABOUR. Notes upon some aspects of social and industrial questions of the day. New York: E. P. Dutton & Co. \$2.25.

²RÉFLECTIONS SUR LA VIOLENCE. LES ILLUSIONS DU PROGRÈS. LA DÉCOMPOSITION DU MARXISME. By Georges Sorel. Paris: Rivière.

³SYNDICALISME RÉFORMISTE ET SYNDICALISME RÉVOLUTIONNAIRE. By Féliçien Challaye. Paris: Alcan.

⁴LA PHILOSOPHIE SYNDICALISTE. LA PHILOSOPHIE NATIONALISTE. By Georges Guy-Grand. Paris: Bernard Grasset. 2 francs each.

says, "as carelessness about facts. It is as hideous as dullness." That he was a good editor, patient, yet capable of snap-piness, is apparent everywhere in the assortment of four hundred and fifty odd letters from which the present compiler, Mr. Lehman, makes his selection. That he had a soft heart and tossed about the sterling gold of England much as Sir Walter Scott's heroes tossed their well-filled purses, is also apparent. A large heart, an open hand, a mind that caught every facet of life that yielded any prismatic glow—these were his. Sometimes you see him critically examining the moonstone. All that glitters is not necessarily gold in the editorial world. Writing of a certain number of his weekly, he says: "It is an awfully and solemnly heavy one—I saw it last night and had a nightmare. I doubt if anything so heavy, except stewed lead, could possibly be taken before going to bed." He could work hard. Once, when the peripatetic chair had come to a halt in London, and the sub-editor was away on vacation, he writes to him not to hurry home. "I shall throw my hat into the ring at 11, and shall receive all the punishment that can be administered by two numbers on end, like a British glutton." Every editorial sanctum ought to have a copy of the letters, and cut the leaves.

Three Plays by Brieux. With preface by Bernard Shaw. English versions by Mrs. Bernard Shaw, St. John Hankin and John Pollock. New York: Brentano's. \$1.50.

Shaw is as witty as ever and more right than usual in his fifty-page preface. It is indeed illogical and altogether wrong to allow all the attractions of vice to be presented in the theater and to taboo any presentation of its frightful penalties. But the difficulty lies, not so much in the stringency of the laws or the narrowness of public opinion, as it does in the inevitable fact that the latter class of plays are necessarily "unpleasant," to use Shaw's own phrase. Whether pathology, either physical or social, is a suitable theme for the public theater is questionable, but the reading of such plays is not open to the same objection and much good may come from a wider acquaintance with Brieux's

exposures of the seamy side of modern life. Certainly no other dramatist, in France or elsewhere, is making such a vigorous attack upon deeply rooted evils. He began with the castigation of particular professions. The callousness of doctors formed the theme of "The Evasion," and the corruption of the judiciary by politics the theme of "The Red Robe." But in the later plays here translated he treats of sexual problems, of race suicide, of mercenary marriage and of the diseases of vice. So rapid has been the advance in public opinion that the reform Brieux advocates in the most terrible of these plays, "Damaged Goods," is already being put into effect in this country, and some clergymen and some States are requiring a clean bill of health from all candidates for matrimony.

Maurice Maeterlinck. A Study. By Montrose J. Moses. New York: Duffield & Co. \$1.25.

This is the most useful book about Maeterlinck for the general reader in English, since it includes a sketch of his life and personality and an analysis of all of his works. As usual, Mr. Moses has been indefatigable in looking up the literature of his subject. He has looked up references, traced out analogies, unearthed sources and compared criticisms until he doubtless knows more about such things than Maeterlinck himself. The chapter on "Maeterlinck the Poet" contains much new material in regard to his first and only book of verse, "Serres Chaudes," written at the age of twenty-six. The discussion of the dramas and operas is also very complete. On the other hand, Mr. Moses gives too little attention to Maeterlinck's importance as an interpreter of nature and exponent of the scientific view of the world.

Studies, Military and Diplomatic, 1775-1865. By Charles Francis Adams. New York: The Macmillan Co. \$2.50.

The ten essays which appear in this volume were written at different times within the past fifteen years, and, for the most part, read before the Massachusetts Historical Society. Mr. Adams discusses such subjects as the battles of Bunker Hill and New Orleans, the ethics of secession, the character of Gen. Rob-

ert E. Lee, and the attitude of Queen Victoria toward this country during the Civil War. He shows everywhere a power of critical analysis and a soundness of judgment which give value to his work as an example of historical method. Particularly interesting, for this reason, is the essay on "An Historical Residuum"; it has all the mystery and triumphant unfolding of a detective tale. No better illustration could be found of the way in which anecdotes, by virtue of mere repetition, find their way into print and come to be regarded as historical facts. Similarly, Victoria's intervention in the "Trent" affair, which has been described with such circumstantiality and so widely believed, is shown to be altogether mythical.

Literary Notes

....A new illustrated monthly magazine, *Western Engineering*, made its appearance the first of April. It is published in San Francisco and devoted chiefly to the water-power, petroleum and transportation problems of California, but includes also a digest of general engineering literature.

....Vice-Principal F. W. Bussell gives a keen and detailed criticism of the inner contradictions and "lurking antinomies" of Stoicism in his scholarly volume, *Marcus Aurelius and the Later Stoics*, one of the best contributions to the series of *The World's Epoch-Makers*. (Scribners; \$1.25.)

....Emerson Hough's *John Rawn* (Bobbs; \$1.25), dedicated "to Woodrow Wilson, one of the leaders in the third war of American Independence," is an extravaganza of American commercialism as personified in the middle class egotist, John Rawn. The book is not only strong—it is odoriferous.

....Negro dialect, Southern roses, pretty girls, honorable gentlemen, and "Yankee" villains are the ordinary ingredients for a Southern love story. *Sidney*, by Modeste Hannis Jordan (New York: Cosmopolitan Press; \$1), is no exception to this rule of sectional romance, tho it is pleasantly written.

....Several years ago Dr. John Watson (Ian Maclaren) wrote for a periodical some devotional studies based on the lives of various characters mentioned in the gospel stories of the Resurrection. These studies are now published in a volume entitled *Children of the Resurrection*. (Dodd, Mead & Co.; \$1.)

....Books by Amélie Rives are like hysterical women. They vacillate between a

gentle, pure-souled passivity and a virago attack of impetuosity. *Hidden House* (Lippincott; \$1.20), a story of dual personality, belongs to the latter type. It abounds in good descriptions, in rather grandiose sentences about life, and in superstitious mysticism.

....*The Mystery of Mary*, by G. L. H. Lutz (Lippincott; \$1), is the kind of novel one buys on the way to the train and drops on the seat when ready to leave. It is a time-killer of the simplest sort. The heroine escapes from a villain to fall into the arms of an honorable lover and inasmuch as it all happens along a railroad track it possesses a certain originality of scene.

....Some sincere and thoughtful criticism is scattered thru the pages of Edwin Björkman's small volume of essays, in which he answers affirmatively the old question, *Is There Anything New Under the Sun?* (Kennerley; \$1.25). The sympathetic studies of men like James, Bergson and Galsworthy make pleasant and profitable reading.

....Those who have felt compelled to move from the old intellectual standards of faith in order to meet the new currents of thought will find justification and comfort in reading *Christianity, an Interpretation* (Longmans; \$1.20), by Dr. S. D. McConnell, whose interesting chapters show how far one may go and still be truly Christian.

....In *The American Journal of Philology*, Professor Gildersleeve in one of those delightful notes of his gives us a couple of verse translations of Greek epigrams well worth quoting. One is:

"How came I? is a question claims reply.
Whence am I? will have answer at my hands.
Why came I? is a problem that demands
To be resolved. Just to depart, to die?
How came I? Why, no matter how I try
Each Argo of adventurous thought but lands
My seeking spirit on a waste of sands.
How can I learn, naught knowing but a why?
Naught was I when I came, and I shall be
Nothing again, just as I was before,
Nothing and naught is all the race of man:
What is there in the world that's left for me,
Save joyance from the wine-god's purple store,
The cure-all holden in the toper's can?"

....Earl L. Bradsher makes *Mathew Carey* the subject of his doctoral dissertation, issued from the Columbia University Press (Lemcke & Buchner, agents; pp. 144; \$1.25). The subtitle is: "A Study in American Literary Development," and the Philadelphia editor, author and publisher doubtless merits the critical study given here. Carey was born in Dublin in 1760, and it was as a publisher that he made his chief reputation. The historian of copyrights will find interesting material here. But nothing other than "material" is to be found; this thesis is no better than most of the American monographs deemed by faculties "contributions to knowledge worthy of publication."

....In *My Larger Education*, by Booker T. Washington (Doubleday, Page; \$1.50) the author begins in his experiences where he left off in "Up from Slavery." It is a thoroly interesting book, full of personal experiences with men that the world likes to know of. Presidents Roosevelt and Taft, both of whom he greatly admires, and business men of high rank, and educators. We learn from it afresh Dr. Washington's educational theory, which he has worked out in Tuskegee. In his conclusions he gives hardly full credit to the institutions of a higher type, of which there are a few that deserve more praise than he gives them. We observe that the pages are disfigured with spellings which may be designated as Briticisms of a sort in this country obsolete. The word *colored* appears often and always with an intruded *u*.

....From the Association Press we receive "a collection of verse for youth," entitled, *Poems of Action*, chosen and edited by David R. Porter, M. A. (Oxon.). The compiler's hope has been to cultivate the in-born love for poetic thing in life, sometimes "stified by the obligatory use of school readers," sometimes "checked by the materialistic tendency of North American life." The following living authors are represented: W. B. Yeats, Henry van Dyke, Bliss Carman, C. G. D. Roberts, Henry Newbolt, Arlo Bates, Austin Dobson, Edwin Markham, G. E. Woodberry, Hermann Hagedorn, James Whitcomb Riley, Alfred Noyes, A. C. Benson, Rudyard Kipling. The anthology is not, however, limited to our own age, contemporary and catholic tho the collector shows himself to be. The volume is one to be placed in the hands of every boy whose imagination can be fired by good verse.

....Having for his successor as Maeterlinck's translator Mr. Teixeira de Mattos, Mr. Alfred Sutro is able to write very frankly of the translator's function, in his interesting introduction to the Belgian master's five act drama *Aglavaine and Sélysette* (Dodd, Mead & Co.; \$1.25). "The translator who cares for his work must," he writes, "while translating, cease to be himself, he must be a reflex of the other, trying to think his thoughts, to feel as he felt; he must reproduce not only the bare words, but the lilt, the flow, the music, the hesitation and eagerness." There are few such translators in the Anglo-American kingdom of letters! But if Mr. Sutro's theory is an altogether sound one, how careful one should be before opening shop as any kind of translator at all. Mr. Sutro pays a sincere tribute to his master; one translator, at least, has nothing to regret in the choice he made. "A large, heavily built man," he describes Maeterlinck. "Perhaps my shyness appealed to him, himself one

of the shyest of men"—a man who has run away from lionizing. At their first meeting, "he talked," Mr. Sutro goes on, "slowly and hesitatingly at first, then with great eagerness, about Meredith, Swinburne, Browning, Hardy—of any one, except himself. And since then we have met very often, and he still never talks of himself."

"He loves what he writes, writes only of what he loves; and the thing once written passes on, indifferent, and turns his eyes elsewhere. The author's vanity is unknown to him; he reserves his enthusiasm for the works of others. And the only subject on which you cannot interest him is precisely the subject of Maeterlinck."

"He is a man of the theater," Mr. Sutro writes of Maeterlinck, and possessed of instinctive technic. But he has created "a method of his own." "The Blue Bird" seems to Mr. Sutro to mark a change: "the philosopher gave place to the child." Yet he had not, in the current phrase, "written down—"; on the contrary, here was his ripest thought. "Had he not, daring greatly, let little Tityl declare that 'there are no dead?'" And it was the direct appeal that this play of his, which remained unstaged for two years after its completion, made when it once was produced, its direct appeal "to the great mass of the people . . . 'the guardians of the watch fires of the tribe,'" that pleased Maeterlinck most.

Pebbles

A FOREIGNER who attended a prayer meeting in Indiana was asked what the assistants did. "Not very much," he said, "only they sin and bray."

THE GENTLE CRITIC.

"A dismal occupation mine,"
The gentle Critic cried,
"To castigate one's dearest friends
And lacerate their pride
Oh, what a painful thing it is
To cavil and to chide!"

"Whenever there's an opening
I always have the blues,
And to the hateful theater
I fare in leaden shoes.
And what a bitter task it is
To ventilate my views!"

"Indeed it is a gloomy trade
To reprobate and ban,
For actors are a kindly folk
Who do the best they can;
And, oh, it is a joyless job
These kindly folk to pan."

"I weep for them," the Critic said.
"I deeply sympathize,"
Holding his pocket-handkerchief
Before his streaming eyes,
While sorting from his adjectives
Those of the largest size.

—Bert Leston Taylor, in the *Chicago Tribune*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, \$3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

A Cabinet Officer on the Tariff

EVER since the end of the Civil War the Republican party has supported and enacted heavy protective duties on foreign products. It was desirable to secure a large revenue, and a high tariff was a most available way. It brings in a handsome revenue, and it is not consciously burdensome to the consumer. The value of the tariff for revenue naturally led to a defense of it, as affording protection to our products against foreign competition. The opposing Democratic party had inherited from before the war a contrary theory, which allowed duties solely for revenue; but the Republican party had inherited no such doctrine. It was the descendant of the Free Soil and Liberty parties, and they grew up before the war from out the membership of both the old parties, Whig and Democrat.

But the doctrine of protection was after the war adopted by the Republican party. Doubtless many of its members were restive under it, but submitted for the sake of a revenue sufficient to pay our pension bills and the interest on our war debt. Of late, the Western insur-

gents have been denouncing the tariff of their party, but if it was proposed that sugar or wool should come in free they were quickly in arms. The Republican party has been for nearly fifty years an advocate of protection, but now we see a change coming. One will soon be allowed to call one's self a Republican and yet be a foe to protection.

Not the insurgents alone give us evidence to this effect, but of all men the Secretary of the Treasury, the very watchdog of protection. The man who might be expected to cry for protection that he might fill his Treasury, this man has during the last week opened a broadside on the tariff. The two parties, he tells us, are at one on the subject, so far as policy is concerned. Both agree that the tariff should be reduced; they differ only in bare theory. One wants it to raise revenue; the other wants it to raise revenue plus protection; both think it too high now and want it reduced; the difference is academic, not practical. He tells us:

"The two parties are now working in the same direction, tho dealing in different shibboleths and adhering to antagonistic theories. Both want reduced tariffs. . . . Neither party believes in free trade; and consideration of that may for the near future be eliminated."

But not in the more distant future, according to the Secretary of the Treasury. Here he talks as the full free trader that he is, but quite consistently with his still holding to the doctrine which as a Democrat he held before he left the Democratic party to ally himself with a Republican administration. He continues:

"Remote, however, as is the prospect of free trade in this country, and academic as the question is today, it is hard to see how any one can doubt that free trade will ultimately be the policy and practice of this country and of all other enlightened and self-reliant countries as well. The theory that we must make in our own country everything we consume, and the theory that it is true prosperity to cut down and cut up, mine and burn, mine and melt, and parcel out as fast as possible every bit of the resources of nature, will fade out as civilization advances. It is simply impossible to conceive a free road to civilization and human progress unless the tariff walls are eventually and in the long run broken down. The protective system may do well enough for the present stage of the world's civilization, but it won't do for a civilization that is much more advanced, nor for a human prog-

ness and a human brotherhood that is better conceived."

Prof. William G. Sumner or Henry George could hardly have put the argument for free trade more clearly and positively than this. He sees that we have free trade between our States, much to our advantage, and every enlargement of territory that breaks down tariff walls has been of benefit, and he desires tariff reduction, but not yet tariff destruction. He wants it reduced gradually and along the methods of the Republican party, by scientific study of the cost of production in this and other countries, and not by any haphazard guesswork.

We may fairly conclude that Secretary MacVeagh is right in this conclusion and that the Republican party is and must be inclusive enough to embrace the advocates both of theoretic free trade and theoretic protection, at least for the present. Both are walking and working together and must for years to come. The difference between the two parties is insignificant. Indeed, it is difficult to say in what they do differ. They include, in each party, those who would protect sugar and wool and those who would admit these products free of duty. Each has its insurgents, who, on either side, will vote with the other party. It may be that we are getting ready for a new alignment of parties.

The conflict between the two parties is mostly a matter of words. In this State the Republican platform just adopted is positive in favor of "protection to American workmen." But it does not go further. It does not ask for protection to the American manufacturer. On the contrary, it—like the platform of the last national convention—skilfully avoids this by limiting protection to "the difference between the cost of production in this and in other countries." That means reduction, but does not say so. The Democratic platform, adopted the next day, begins with an extravagant absurdity:

"The Democracy of the State of New York, in convention assembled, reaffirms its belief that most of the evils in the public life of the country spring from the exactions of the present iniquitous tariff law, under which monopoly is fostered, competition is destroyed, waste and extravagance in public expenditures are encouraged, the prices of the nec-

essaries of life increased out of all proportion to the earning capacity of the people, and the fundamental virtues of economy and honesty have been banished from the public service."

Whatever evils come from an excessive tariff, they are not the cause of present evils, witness the late unparalleled strike in Great Britain, a free trade country. Those who wrote that plank know better. The two parties abuse each other, but both want protection and both want reduction. Where to reduce and where to protect is the selfish question.

What, then, are the differences between the two parties? Is it the differences between the "ins" and the "outs"? It is this, and perhaps something more, but the platforms do not fairly tell us. Perhaps new parties are in the making, which will have real policies as well as cobweb theories.

The Philosophy of Syndicalism

It is curious to notice that as soon as syndicalism comes into the field socialism appears safe and moderate by comparison, and attracts even the conservative members of the community as the lesser of two evils. A conspicuous illustration of this effect is seen just now in England. Up to the present the labor movement there was composed of two factors: unionism and socialism. The trades unions were regarded as model institutions of their kind, minding their own business, running co-operative stores, accumulating large funds for the support of members and their families, conducting strikes solely for the improvement of the conditions of their particular trade and without systematic and authorized violence. Then came the socialists, and the movement assumed a political character. The union funds were used for electing labor representatives to Parliament and are securing the enactment of a series of reform measures, such as old age pensions, labor exchanges and insurance for sickness and unemployment. Such socialistic proposals as the national ownership of coal mines were, however, regarded as chimerical and dangerous by the British public. But all of a sudden papers of various parties are

voicing a demand for the Government to take possession of the mines and work them as the only salvation of the country. Salvation from what? From syndicalism, which has now for the first time crossed the Channel and appeared as a factor in a labor contest. The present great coal strike is on the whole being conducted on the old-fashioned trade union lines. There has been no violence and the aim is simply to obtain a minimum standard of wages for underground men. This is well deserved and would probably be granted by the owners did they not fear that it would prove the entering wedge of syndicalism, for pamphlets have been discovered in circulation among the miners advocating the complete syndicalist program. After the minimum wage was secured the plan proposed the adoption of the "irritation strike," that is, delay, slack work and deterioration of product, until the mines ceased to be profitable and the companies were ready to surrender them to the miners to work at their own will and profit.

In the United States syndicalism has been longer known and has of late gained many adherents from the ranks of both socialism and unionism. The movement first became formidable in Colorado, and there some years ago its theory was first called to the attention of the American people by that startling reply which a member of the State Legislature sent from Cripple Creek when the Governor telegraphed to know if he should send troops to that disturbed region. The reply was to this effect: "No need for troops. Miners in peaceful possession of the mines." Syndicalism has come conspicuously to the front in Massachusetts in the Lawrence strike, which is conducted by the Industrial Workers of the World, a syndicalist organization. Both Haywood and Ettor are reported to have advised the use of *sabotage* as a weapon to secure their ends; for example, the putting of emery powder in the bearings of the machinery.

But it was in France that syndicalism was born and has reached its highest development, both in theory and practice. The term is derived from the French name for labor unions (*syndicats*), and

the policy was developed by the national confederation of the unions (*Confédération Générale du Travail*). The C. G. T., as it is generally called, is managed by a committee of seven men, all of the working class, and it has become within the last ten years the dominant force of the labor movement, daily becoming more conscious of its power and clear in its aims, contemptuously shoving aside the older ideals of socialism on the one hand and trades unionism on the other, defying the Government and threatening to destroy the whole industrial system. The socialist aims to secure control of the state, by peaceful political methods if that is permitted, or, at the worst, by an armed revolt. The syndicalist, on the contrary, does not believe in the state. He does not believe that there is such a thing in reality. So, instead of trying to overthrow the state, like the anarchist, or seize it, like the socialist, he would get rid of it by simply denying it. How do we get rid of ghosts? By bombs? By votes? No, by realizing that the ghost is a figment of the imagination.

Let all of the workingmen in the country lay down their tools on a given signal from the C. G. T. What happens? At once, without a blow, the Government becomes a nonentity, the capitalist becomes powerless. Nothing remains except the trade unions, which then assume control of their respective industries and run them in their own interests, electing their own foremen, setting their own hours of labor, charging what they please for their products. Such is the theory of the general strike. It is recognized as a mere theory by some of the leaders. But, say they, all great social movements have had similar impossible ideals, all are based on "myths"; the faith of the early Christians in an approaching millennium; the faith of the men of the French Revolution in Liberty, Equality and Fraternity; the faith of the socialist in his utopia. These beliefs, tho fallacious, afford inspiration and instigate action, and so are justified by their fruits. Here the syndical theorist connects up, somewhat illegitimately, with the intuitive philosophy of Bergson, claiming that syndicalism is also a reassertion of the claims of actuality and

activity as against the barren formalism of the Marxian socialists.

But in awaiting an opportunity to use the general strike syndicalism is making free use of its minor weapons, such as *sabotage*. It has discovered that employees can do a great deal more harm by remaining on the job and working mischief than by striking. Handbooks are published, giving instructions as to the most effective way of crippling an industry; for example, in the furniture business by scratching the varnish when boxing; in the postal service by missending mail; in railroading business by cutting the signal wires; in construction by burning blueprints; in baking by putting powdered glass in the bread. Obviously it would not be necessary actually to carry this last measure into effect. A mere rumor that it was being practised at a certain bakery would be sufficient to stop its trade.

Home Rule for Ireland

PERHAPS the most notable point in the speech made by Mr. Asquith in introducing the bill for the government of Ireland was that in which he hardly more than incidentally said that it was a fraction of a larger scheme which would apply a similar devolution of labor and responsibility from the Imperial Parliament, so as to give local home rule to England, Ireland and Wales. That shows a large constructive thought. As Ireland ought to be allowed to attend to her own local government, so Scotland ought to have her own parliament and attend to her own affairs, and so should England and Wales. If the new scheme for Ireland should, after a few years, be found to work well—and there is no reason why it should not, notwithstanding Ulster—the parts of Great Britain will want the same advantage. The plan of a dual government, states within a nation, works admirably with us and can in Great Britain and Ireland.

The Irish Home Rule bill is wise and generous, while it abundantly protects the rights of all the sections of the island. There will be two houses, and the 40 Senators will be nominated at first by the Crown and will serve a fixt term, and as

they retire they will be replaced by the Irish Executive. That is not as good as our way of having Senators chosen by the States, but it approaches the English way for the House of Lords, and perhaps anticipates how the reformed House of Lords will be constituted. The 164 members of the House of Commons will be elected, and Ulster will be generously provided with 59 of them. The Ulster Unionists swear that they will never submit. That would mean that they would refuse to vote for members, which would give the Home Rule men in Ulster all its members, a silliness of which the enemies of the bill may be quite competent. That is the way that a defeated party pouts and abstains in some Spanish-American republics when it does not prefer rebellion.

The bill is careful to separate imperial from local interests and control, and also to protect the rights of the Protestant minority. No law can be enacted in the interest of any religion, and the Governor-General, as in Canada, and the Parliament at Westminster can veto any act. That seems quite sufficient, but Ulster still complains, with abuse more than with reason. The representation in Westminster is reduced.

The revenue question is of especial interest. At present the government of Ireland costs \$61,750,000, all paid from the imperial revenue, while the revenue from Ireland is \$54,200,000, a deficit of revenue amounting to \$7,550,000. The Irish revenue will be given over to the Irish Parliament, and this deficit will be made up, for the present, from the imperial revenue. The taxes will still be collected as they have been, except that the postal profits will be kept for Ireland, and Ireland will have the right to increase the tariff up to 10 per cent. against foreign countries.

While the bill seems fair and just, and while it satisfies Ireland, the great advantage we look to for it is that it will bring peace and good will. Ireland has been in semi-rebellion for generations. It has been governed by a sister island as if it were a conquered dependency. Here we have at last an Administration that is not afraid to trust the people of Ireland, just as it has trusted the Dutch

Boers of South Africa. The experiment in South Africa has been a brilliant success, a magnificent credit to the Liberal party in Great Britain. We believe the same result will follow in Ireland. And the influence will be felt in this country. Give us an Ireland that is at peace with England and one of the disturbing factors in American politics will be eliminated. It is the American-Irish that stir up ill-will against England. This victory across the sea will strengthen the bonds between the two nations. We shall have a greater Britain, a stronger United States, and an alliance of hearts between the two nations that can never be broken.

The Republican Candidates

MR. ROOSEVELT'S victories at the primaries in Illinois and Pennsylvania do not point to his nomination. Nor do they prevent the nomination of Mr. Taft. But they show that the condition of the Republican party is unhappy and unfortunate, in a political sense of these words, and that the President and his friends are in a difficult situation. Undoubtedly, the result in Illinois was due largely to a revolt against Lorimer and Lorimerism, as well as to disapproval of the reciprocity agreement with Canada. It was well known that Mr. Roosevelt some months ago refused to sit at a dinner table with Lorimer, and in the speeches which he made just before the primary votes were cast he persistently denounced the unworthy Senator. An impression prevailed that Mr. Taft had supported Lorimer's efforts to retain his seat. This was an unjust impression, for it is known at Washington that the movement against Lorimer had the President's approval, altho he felt that this approval could not with propriety be publicly expressed. It was understood that his views on the subject were in accord with Mr. Root's speech in the Senate. In Pennsylvania, there has been a revolt against Senator Penrose and what may be called the Penrose machine, a revolt so pronounced that it even accepted Boss Flinn, of Pittsburgh, as an instrument with which its force might be used effectively.

After due weight has been given to these causes of the President's failure in

the two States, however, it must be said also that many of the Republican voters had lost respect for or confidence in Mr. Taft and preferred Mr. Roosevelt. Some were attracted by the ex-President's personality and opinions; others, probably, felt that he would do better than Mr. Taft at the polls in November. As we have said, however, there is no indication that the Republican party will nominate him. The President is far ahead in the race for delegates, and out of those still to be chosen Mr. Roosevelt cannot hope to secure enough to make his entire number anything more than a minority.

Mr. Taft has nearly all the delegates from New York, altho they have not been positively instructed. They are urged by their platform to vote for him. In New York the President and his party were not wholly fortunate in the controlling manager of the convention or in the resolutions adopted. It may be that Mr. Barnes unjustly suffers public disapproval, but it must be admitted that in a political sense he is a burden on the party's back. The resolutions very properly, in our opinion, express opposition to the recall of judges or of court decisions, but very unwisely denounced the initiative and referendum. Without discussing the merits of these methods, it may be said that denunciation of them was an affront to thousands of worthy and intelligent Republicans, especially in the West. If a large majority of the delegates sought to express their disapproval of Mr. Roosevelt's candidacy, they could have done this with sufficient emphasis by condemnation of the recall of judges and court decisions.

The history of the primaries in Illinois and Pennsylvania and of the convention in New York shows that Mr. Taft continues to be unfortunate, not by reason of his own shortcomings, but on account of his association, or supposed association, with and reliance upon certain party leaders whom the people do not respect. It has been so from the beginning. In the great tariff blunder he suffered because of his apparent association and sympathy with Mr. Aldrich, Mr. Payne, Mr. Cannon and others who were leaders of his party in Congress. From that blunder the party

has not recovered, and his own fortunes have been very seriously affected by it. Party leaders, blind or worse, have been the sinners. He has suffered for their sins rather than for any of his own.

Because of what has taken place in Illinois and Pennsylvania, and of what may be called the moral effect of it, there will inevitably be much talk about some one for whom no delegate has expressed a preference, but in support of whom the warring factions could unite. In our judgment, Mr. Taft deserves a renomination, and his party would stultify itself in withholding this from him. Is there any good reason why he should be the first Republican President to be so humiliated? So far as we can see he will have a nominating majority of the convention on the first ballot, and thus is in the way to gain that to which he is fairly entitled. But his former friend, who, a short time ago, could scarcely find words eloquent enough to express his conviction that no better man, no more thoroly equipt man, no man so closely resembling Lincoln, had ever been placed in the White House, has now split the party by denouncing him as a reactionary, an upholder of oligarchies, the consenting representative of bosses, and the promoter and beneficiary of electoral fraud. This former friend desires to displace him, and has secured a considerable following. In the contest for the nomination there has been shown, mainly or almost wholly on his part and not by Mr. Taft, a bitterness the exhibition of which between opposing parties is usually expected, but which is without precedent, we think, between men of one and the same party seeking the highest honors it can give.

All this does not make a pleasing situation, nor is it distinctly encouraging for the Republican party with respect to the result at the polls in November. But the President should persist in his candidacy and accept the nomination which a majority of his party desire to give him. So far as can now be foreseen, it will come to him on the first ballot. The only man who has been mentioned as a possible compromise candidate is a man whose conduct with respect to the matter has been irre-

proachable. He will not permit his name to be used in opposition to that of the President. We have used the word compromise for convenience. It is really out of place. Mr. Taft cannot become a party to a compromise agreement with any other candidate now seeking support. This would involve ignoble surrender and a sacrifice of principles. The course to be taken by him until the convention assembles is clearly marked out.

Two Americas

"WE, the people" of the United States are so in the habit of calling our land "America" that we have some difficulty in realizing that a big continent and an interesting civilization in the southern half of the western hemisphere have an older claim to be called America than we have. This would not be important if, at the same time, we did not permit our collective "big head" to interfere with a decent understanding of our South American neighbors and their institutions. It would be distinctly to our political and business advantage to understand them. Such understanding would help us also to understand ourselves. The civilization of the South American republics is of a type different from ours, but not necessarily inferior. In fact, it offers certain features of cultural value that we could adopt and be none the worse for the appropriation.

In the first place, the South American republics are not the unformed, unstable social organizations that most of us in the United States imagine them to be. They have had their revolutions and lesser internal troubles, but none of them has been comparable to our Civil War in cost and damage. Their populations are more largely illiterate than ours is and contain a smaller proportion of European white blood than ours does, but race problems have never yet made the South Americans as much trouble as they have made us. An educated white population, amounting to about 25 per cent. of all inhabitants, controls the situation, dominates politics and carries on business. The civilization of this white element is, of course, Latin, in a certain sense, but it is not Gallic, nor yet

Roman. Its spirit is rather Castilian, and it takes more kindly to German ways than to North American or English ways. It attracts also a superior Italian immigration. German bankers have played a large part in organizing South American finances and in creating the channels and methods of South American business.

Inevitably, North American manufacturers will more and more seek South American trade. Inevitably also, the United States will make the Monroe Doctrine a pretext for resenting European influence in South American politics. For these reasons it is becoming day by day more urgently important that we should cultivate a sympathetic and respectful as well as a self-respecting attitude toward the South American peoples. We must listen to such North American students of South American Affairs as Senator Root, Professors John Barrett Moore and William R. Shepherd, of Columbia University, and Professor Leo S. Rowe, of the University of Pennsylvania, whose first hand knowledge is that of intelligent and broad-minded men; and cease to give ear to blatant jingoes whose ignorance will bring us nothing but loss of money and national humiliation.

The South American is proud, and he has a right to be. In nine cases out of ten he has the manners of a gentleman, and he understands that there are things in life worth having besides produce exchanges and factories. He has learned that it is quite possible to do business without being curt and self-important, and without tearing thru the day in a continual hustle. Such a man knows what he wants, and he expects to buy goods of producers who are willing to sell him what he wants put up in the forms that he likes. He does not take kindly to men who think that they know it all, and can make him buy everything that they prefer to make and sell. He has a deep prejudice against that attitude of the Northern mind, which is expressed in the slang phrases, "put it all over" and "get it across." The Northern businessman who expects to have important dealings with his South American neighbors will have to make up his mind to behave like a gen-

tleman, and remember that he is dealing with men who are quite competent to place their orders where they please.

To a highly accomplished diplomat who is greatly respected and liked by South Americans, one of the most distinguished statesmen of Argentina, said a year ago: "The people of the United States need to cultivate idealism." "Indeed," was the reply, "the people of the United States believe that they are one of the most idealistic peoples on earth." "Ah," was the rejoinder, "they do, but they fail to distinguish between idealism and sentimentality. They are the most sentimental people in the world. They can be more silly over a purely sentimental issue than any other nation. Idealism is another thing. If they hope to become, in the highest sense, a civilized people, they will have to discover what true idealism is and cultivate it."

The Path to Contentment

It is sometimes hard to tell where contentment leaves off and indolence begins; but it is quite true that, in this ambitious, struggling American life of ours a great deal of happiness is spoiled by forgetting to appreciate the blessings we have in our eager desire for more. Many people are straining their eyes into the future so much that they quite overlook the present.

But if one can only realize the beauties and comforts of each day as it passes and give a few moments to reminiscence over past pleasures, without, of course, sacrificing one's ambitions for the future, he will quite surely find his life sweeter and richer.

To be a little less vague, a man should form a habit of enjoying his life as he lives it. He may hope to be more prosperous, to have larger business or a better position next year, but he should not let that hope interfere with his appreciating the position he has won for himself this year.

Next year he will have one less year of life to live than he has this year, and what he gains in success he loses in youth. Each year he pays a mighty price for what he gains—a year of his life—one sixtieth or eightieth of his life span at the least, and quite possibly a much

larger fraction. In spending this precious thing he should follow the business axiom of trying to attain the maximum of returns for the price paid.

So, when a man works, let him work to the best of his ability, and he cannot work to the best of his ability if his work one day exhausts him so that he cannot work with all his vigor and enthusiasm the next day. And work, after all, is only one of the important elements in his life. He should cultivate the power to play, to make and keep friends and to be a bright and attractive element in his family. If he has young children, he should consider daily engagements to play with them quite as important as a business engagement. Their years are passing, too, and he should not lose too much time of their beautiful childhood. His boy has a right to expect a daily game of ball or marbles or a half hour of reading aloud with his father, just as his little girl should find in him a sympathetic playfellow in her doll house. What kind of tools to select for the work bench, the choice of a bicycle, the "Swiss Family Robinson," fairy tales, doll dresses, rabbits, imaginary voyages to the Spanish Main or Viking Land, toy stores and "pretend" tea parties—all the dear, delightful occupations and interests of children are second in importance to nothing; and the father or mother who is too busy to enter enthusiastically into this charming realm is not only neglecting an important duty, but is missing the sweetest pleasures which life has to offer.

It is well to build for the future, but while one is building one should have warmth and shelter and a home fireside *now*, and have a mental attitude that allows a full enjoyment of that fireside. Your neighbor may have more servants and a larger house and income than you, but is he really richer? His servants mean more vexatious domestic problems and his wealth is quite powerless to purchase him more happiness than you can acquire. Emerson says, tho you travel the world over to find the beautiful, unless you take it with you, you will find it not. One gets the best out of life by his mental and spiritual attitude toward life. Too much ambition brings restlessness and discontent; too little brings inca-

capacity for true enjoyment. A man with the proper poise makes work the means and not the end, and finds time to enjoy and profit by the good things that are close at his hand every day. The man who is so absorbed in his business that he has only a vague, absent-minded interest in things beyond his office door gets really very little out of life.

The man whose worldly prosperity makes him think he must have an elaborate home, elaborate food and elaborate entertainments in order to be comfortable is feeding the body and starving the soul. True culture is not found in fashions, but in a sympathetic appreciation of beautiful things; and if a man finds delight in the view of a daisy-white meadow, a violet-tinged glen, in poetry and art and music, and in the play and prattle of children, or a stimulating conversation, he has riches which a millionaire cannot buy with all his money.

In other words, if a man will only pause for a little space every day upon the breeze-swept hilltop of the present and look about him at the view and find it pleasant, breathing in the sweetness and sunshine of life, he will then find that the path to contentment, flower-bordered and inviting, lies close at his feet, luring him to follow it.

The Loss of the "Titanic" The "Titanic," the new monster liner of the White Star Line, has run into an iceberg on her maiden voyage and, as we go to press, probably sank. The passengers and crew took to their boats, waiting for the coming of other vessels summoned by the blessed wireless. It is nothing less than criminal that a multitude of steamers crossing the Atlantic run the risk of such a disaster by taking the shortest route, just where icebergs are to be expected, instead of a southern route, just to save time at the risk of life. Here was a vessel costing \$10,000,000, bigger than an apartment house, a sixth of a mile long and fifteen stories high, with a population of not less than 1,200 people, who might be 4,000, rammed forward at utmost speed to make a record, thru fog—for in clear weather an iceberg could be seen and avoided, and an ice field makes

a fog—and in the thick of fishing boats. Not a transatlantic steamer should be allowed by international law to take other than the southern route until the 15th of June, when the ice will have crumbled and melted away. The day before the French liner "Niagara" was stove in by striking an iceberg in the same way, and called for help, but was found able to proceed without help. If it should turn out that there is a serious loss of life the lesson of the tragedy may be heeded, altho the money loss might give concern.

Two War Leaders have died during the past week, Major-Gen. Frederick D. Grant and Clara Barton, founder of the Red Cross. General Grant was best known to the country as his father's son, altho his career had been an honorable but not distinguished one. One of the most creditable things in his record has been his opposition to the re-establishment of the canteen in the army as a purveyor of alcoholic drinks. He had once been its supporter, but the soldiers, he said, have now adjusted themselves to the new conditions, and he was free to say that if the decision were left to him he would not recommend the restoration of the canteen. Clara Barton was a heroine of the Civil War. She was born on Christmas Day, the day of peace and good will to men, ninety years ago. She was in charge of a division in the Patent Office when the Civil War broke out, but began her work for the wounded soldiers with the first blood of the war. In 1861 her father left her an ample fortune, and she gave her whole time to her army work. President Lincoln gave her large authority and freedom for her work, which she carried on at her own heavy expense. At Berne, in 1869, she took part in organizing the Red Cross Society, and the next year had charge of a department of the society in the Franco-Prussian War. On her return to this country she devoted herself to the benefit of soldiers in war, and was soon made president of the American branch of the Red Cross Society. During the Spanish-American War, altho nearly eighty years old, she went to Cuba and directed the

work of the society in the field. Meanwhile she had enlarged the scope of the American branch to help in other disasters besides those of war, such as earthquake, famine and flood. The task of such a woman has been to repair the damages of war, and the heroine is not to be classed one whit below the hero.

Senator Lorimer as a Hoodoo Senator Lorimer's purchase, as so much evidence tends to show, of his seat as United States Senator from Illinois, was a principal factor in giving the primary election in Illinois by an overwhelming vote to Mr. Roosevelt; and this is a happy sign. The people as a whole are not likely to distinguish too narrowly, and they do not ask very closely whether President Taft was in any way responsible for the success of Senator Lorimer in escaping expulsion from the Senate, but they wanted in some way to condemn it. It was enough for them that so many of the President's supporters voted for Mr. Lorimer. It is well that the Lorimer methods of political success should be sharply condemned by the people, even if the old method of condemnation is not wholly logical. When you see an evil strike at it, is a pretty good rule, even if the blow hits more than it was aimed at. It has been observed that of those who voted in favor of Senator Lorimer at his first trial not one has been re-elected by the people, the last to fail being the aged Senator Cullom, from Illinois, defeated by the primary vote.

Little Interest in Polity It has been noted in some Presbyterian journals that the Congregationalists do not seem to get at all excited over the report of their committee which was appointed to make recommendations for the improvement of the polity of the denomination and the direction of its benevolent societies. Those recommendations are pretty radical, but nobody seems to care much, even tho the control of the societies will be centralized and put practically into the power of the National Council. It is to the credit and not the

discredit of the denomination that they take so little interest in the matter. The report of the committee was published in advance of the meeting of the National Council just so that it could be discussed; but there is no rush to approve or disapprove, and the editors have to beg correspondents to express themselves. The fact is that they are too anxious to get work done and too well satisfied that it has been well done, to worry about the machinery of it. What is polity to service? In these days we are talking and practising union of Churches, and are sure that the tuning up of our polity is not a very important matter. Suppose the National Council should meet once in two years instead of one, and half its members hold over, what of it? Suppose the members of the benevolent societies who vote at their meetings should be members of the National Council, would not they attend to the business just as well? The matter is not of enough account to get excited over. Let the real work go on, done by the missionaries at home and abroad, and let the work of church fellowship and union proceed.

Italy and Turkey The war between Italy and Turkey goes on in very much the way of a fight between the whale and the elephant, Italy being the whale and Turkey the elephant. Assim Bey, the Turkish Minister of Foreign Affairs, hits the case right in an interview meant for the world when he says that Italy has a navy and Turkey none; but Turkey has an army. Italy uses only her navy; or, at most, she keeps her soldiers in Tripoli under the protection of the guns of her fleet. She sends her ships along the Arabian coast to pick up some little advantage, or she fires a few shot into Beirut or some Aegian isle, but does not dare to land any soldiers. We do not see but a war of this kind might go on for a century, with little loss to Turkey, and with much financial loss to Italy. Assim Bey says that the moment an Italian army sets foot on Turkish soil they will meet on equal terms, and, judging from previous experience, he declares that no Italian soldier will return except by

Turkish permission. It is evident that Italy does not dare a battle on land. She entered upon this war quite too lightly-heartedly. Thus far the loss has been hers; and her only line of retreat with credit to herself lies in securing pressure from the European Powers to be put on Turkey. But even so, we do not see but that Turkey can refuse, and is likely to refuse, to yield the annexation of Tripoli. Italy finds very little sympathy in what seems scarcely less than robbery.

We condemned the terms of the first proposal to give a charter to the Rockefeller Foundation, not because we thought that any evil was likely to result from it, but because the safeguards against possible evil were not provided for. In the new bill now before Congress they have been supplied, and we do not see why a foundation with an endowment of one hundred million dollars cannot be approved, as recommended unanimously by the committee. The object proposed is solely to promote well being and to advance civilization in this and other countries; and Congress can at any time limit the means by which it is attempted to accomplish its purposes. Imagination can hardly conceive the amount of good that may be accomplished by such a gift.

If prisoners try to starve themselves to death should they be fed forcibly? We do not see why not. If they are women, does that make a difference? We do not see why. If they are suffragets, should they be allowed to commit slow suicide? That does not seem reasonable or humane. If they persist should they be freed? That is the way the British Government has got out of the disagreeable trouble. Four window-breakers there have got the better of the law in that way.

It is almost amusing to see that Princeton has entered on a scheme to escape the reputation of being a rich man's college by establishing a farm to raise vegetables for the students' tables. This takes a leaf out of the negro colleges in the South.

A Crippled Pension Fund

THE statement is made on the authority of a leading actuary of New York City, who has made a careful examination of the subject, that the pension fund administered by the city for the purpose of paying annuities to retired school teachers is unscientifically constituted and plainly inadequate to the future demands which will be made upon it. At no distant day, we are informed, a condition will be reached that will render the addition of new names to the pension list impossible. "In the meantime," adds this expert, "the teachers not retired, who have paid 1 per cent. out of their salaries into the fund, will get nothing in return."

It would seem from this information that the fund is founded and maintained on no scientific principle whatever, and that, regardless of the ages and expectation of life of the contributors to the fund, it has been ignorantly assumed that 1 per cent. of the salaries of the teachers, plus interest accretions and uncertain donations, would be at least sufficient to achieve the results aimed at. As a matter of course, under the circumstances, the present beneficiaries of the fund have no assurance that their pensions will continue to be paid, and they have every reason to regard the future with trepidation. This is an unfortunate matter in that it vitally affects the supplies which so many persons who, through old age, impaired physical or mental condition, or for other causes, have passed beyond their productive period and are more or less dependent on a fund which seems to be insolvent.

It would appear to be the duty of the State Insurance Department to assume jurisdiction over this and other funds instituted for similar purposes, at least to the extent of investigating the principles, if any, under which they operate, and of pointing out such defects as exist. In the meantime, it is presumed that the school teachers have not carried all their eggs in this one weak little

basket, and that each has a fragment of endowment insurance which, at a pinch, can be converted into an annuity.

PRELIMINARY figures issued by the New York Insurance Department covering the operations of the 34 life insurance companies reporting to it show them possessed on December 31, 1911, of combined assets amounting to \$3,919,151,219, and "unassigned funds" (free surplus) of \$194,156,991. The total premium income of these companies in 1911 was \$564,933,165, and their total income \$754,639,989. They paid for death claims, \$180,121,937; for endowments, \$44,769,373; for annuities, \$7,067,579; for surrendered policies, \$75,710,202; for dividends to policyholders, \$80,095,321. Their total disbursements were \$526,823,821. Calculating on the basis of renewal premiums, which aggregate \$404,324,774, the dividend rate to policyholders averaged well, being 19.5 per cent. The total insurance in force at the end of the year was \$16,017,233,803, a net increase over the same time the preceding year of \$885,817,485.

THE Mutual Life notifies its policyholders that the intervention of attorneys, brokers or commission men in the collection of death claims from the company is unnecessary, and that its managers throughout the country, if promptly notified of deaths, will not only furnish proof-of-death blanks, but assist in every way possible to facilitate the collection of claims. The company issues this advice in an effort to save its policyholders unnecessary expense and trouble in collecting claims. The information is of value to policyholders in all reliable companies. Whenever they are in doubt on any point they should write directly to the head office of the company in which they are insured.

LONDON Lloyds latest gaming enterprise took the form of insurance to shopkeepers against looting during the recent strike in Britain.

Food Prices and Cost of Living

THE first of the year's crop reports, published on the 9th, and relating to winter wheat, tended to depress the securities market and to advance the prices of food. Winter wheat's condition on April 1 was reported to have been 80.6, against 83.3 one year ago and a ten years average of 86.1. There had been a loss of about 6 points since the preliminary report in December. The general prediction was that the crop of winter wheat would fall below last year's, which was 431,000,000 bushels. Following the publication of the report there were stories of extensive winter killing in Illinois, Ohio, Indiana and other States. Prices of grain and provisions advanced. On Saturday, May wheat at Chicago sold at \$1.10, the addition for that day having been four cents. Dispatches from Denver said the wholesale price of beef on the hoof there had been increased within a short time by 25 per cent., to the highest figures in ten years.

The cost of living is affected, of course, by such changes in the food market. Recent increases of wages tend also to make this cost higher. The increases granted at the textile factories of New England amount to \$10,000,000 a year and have already caused higher prices for goods. Within the last few weeks a considerable number of wage increases in other parts of the country have been reported, some of them having been granted voluntarily. Others may soon be added, as the result of negotiations pending or of strikes in progress.

Bradstreet's index number for April, 9.1010, is higher than the number for any preceding month for two years. Comparisons show an advance of 7 per cent. since April 1, 1911, and of 14 per cent. since April 1, 1904. This number is based upon the prices of ninety-six representative commodities. Average annual indexes show an advance of 46 $\frac{3}{4}$ per cent. since 1897. Similar indexes recently published by the Government's Bureau of Statistics, and based upon 257 commodities, show an advance of 44 per

cent. during the same period. But the average was a shade lower in 1911 than in 1910.

The growing cost of living has exerted a considerable influence in national politics. To it the Republican party's leaders have not given sufficient attention. By many that party is held responsible in part for it. On the other hand, much of the legislation attempted at Washington by the Democratic party has been designed, in the opinion of a great many, to reduce this cost.

Small Bonds

UNTIL a short time ago, the unit for bonds of railroads and other public corporations was \$1,000, but now the investor can buy such bonds in denominations of \$100 and \$500. The list of such securities is already a long one, including (for one or the other small denomination) nearly twenty railroad companies, a dozen municipal gas or electric lighting companies, and half as many industrials. Among the railroad companies are the Atchison, Baltimore & Ohio, Rock Island, Illinois Central, Northern Pacific and Union Pacific. The investor can realize from 4 $\frac{1}{2}$ to 4 $\frac{3}{4}$ per cent. upon a considerable number of these issues, with safety. There are banking and brokerage houses which make a specialty of such bonds, issuing price lists and giving such other information as the investor may desire.

....Death duties amounting to \$1,400,000 must be paid upon that part of the estate of Don José Garvey, a Spanish wine merchant, which is situated in England.

....A company capitalized at \$3,000,000 will develop 20,000 horse power by an electric plant on the Dix River in Kentucky, intending to sell the power in Lexington, Louisville and other cities. By means of a similar plant at Friendsville, Md., on the Youghiogheny River, a company capitalized at \$4,000,000 will supply power to cities in Western Maryland.

VOL. LXXII NEW YORK, THURSDAY, APRIL 25, 1912

No. 3308

Survey of the World

The "Titanic" Tragedy

Sixteen hundred and thirty-five lives were lost in the sinking of the White Star Liner "Titanic" at 2.20 a. m. April 15. The bodies of a large number of victims have been found by the cable steamer "Mackay-Bennett." The "Titanic" is the thirtieth steamship to have met her end off Newfoundland since 1837. Her bulkheads only served to delay her sinking after she had torn her side out on the submerged ledge or spur of an iceberg sighted too late by her look-outs. The water which entered her wounds exploded her boilers and broke up the ship. As we stated last week this steamer—laid down at Belfast and the largest ever launched—was making her maiden voyage, Southampton to New York. She carried over 2,300 persons, had cost \$10,000,000, and carried \$420,000 cargo and 3,423 sacks of mail—all lost. J. Bruce Ismay, managing director of the International Mercantile Marine Company (controlling the White Star Company), one of the few survivors among the male passengers, denies that the ship was trying to establish a record; but the speed maintained on the fatal night was from 21 to 23 knots, tho the ship's officers knew icebergs were near. The theory that their leviathan was unsinkable seems to have prevailed. The shock of collision, which occurred fifteen or twenty minutes before midnight, was not violent; few realized their peril. Two and a half hours later the ship lay at the bottom of the sea. The saved are thus classified: First cabin passengers, 212 out of 390 (154 survivors being women and children); second class, 116 out of 270 (102 sur-

vivors being women and children); third class, 170 out of 800 (83 survivors being women and children); officers and crew, 207, including 22 stewardesses, out of 985. The loyalty of the "Titanic" crew has been generally recognized by survivors, altho stories are told of brutal stokers and of pistol shots fired at excited steerage passengers by the officers. The self-sacrifice of the great majority of male passengers is matched by the devotion of Mrs. Isidor Straus, who refused to save her own life, since the "women and children first" rule doomed her husband. F. D. Millet, painter and veteran war correspondent, and Major Archibald W. Butt, military aide to the President, were among those who assisted others to safety, then cheerfully went down to death while the ship's orchestra played "Nearer, My God, to Thee." Had the "Titanic" been properly supplied with lifeboats, practically all would have been saved, for the sea was calm, and at 4 o'clock in the morning the 705 persons whom the boats contained were picked up by a Cunard liner hailed by wireless. Some of the passengers thus rescued had jumped from the rail of the sinking steamship and had been pulled aboard lifeboats; even so, not all of the latter contained their complement of passengers nor were they supplied with food and water. The survivors were carried to New York by the Cunarder "Carpathia," which docked Thursday evening, and on Friday recommenced her voyage to the Mediterranean. The law has not compelled ocean greyhounds to carry lifeboats enough to accommodate all passengers; the "Titanic" had enough to carry only one-third of her passenger

THE WHITE STAR LINER "TITANIC"

This steamship, which, on April 15, sank about four hundred miles off Cape Race, with most of its passengers and crew, was the largest ever launched, having a tonnage of 45,328, and a length of 882½ feet. Her total loss occurred on her maiden voyage.

list, leaving the crew out of account altogether. Several lines have abandoned the northern route, dangerous at this season, for the present at least, and will also carry lifeboats enough to accommodate all passengers. An investigation of the disaster by a sub-committee of the Senatorial Committee on Commerce, Senator Smith, of Michigan, presiding, was begun last week at New York, and will continue at Washington. P. A. S. Franklin, vice-president of the White Star Line, was a witness at Monday's hearing in the capital. The House of Representatives and the Department of Commerce and Labor are likely to take action; so, too, the British Board of Trade. Mr. Ismay, of the International Mercantile Marine directorate, has been denounced by the American press and on the floor of the United States Senate for his share of responsibility for the "Titanic's" course, speed, etc., and for the wireless messages which he sent from the "Carpathia," that were intercepted by U. S. S. "Chester." These messages called upon the White Star Line to detain the

"Cedric" in order to ship the survivors of the "Titanic" crew out of New York at once. W. T. Stead, the English journalist; Col. John Jacob Astor, Benjamin Guggenheim and George D. Widener, capitalists; J. B. Thayer, second vice-president of the Pennsylvania Railroad; C. M. Hays, president of the Grand Trunk Railway; Henry B. Harris, New York theatrical manager; Jacques Futrelle, novelist, and Captain Smith, commander of the "Titanic," are conspicuous victims. A wave of grief has passed round the world. Large funds have been subscribed at New York and elsewhere for needy survivors, and benefit performances and memorial services have been held. We discuss the disaster and its lessons editorially, and in the article "Perils of the Atlantic Ice Fields."—Inquiries are promised of the false "wireless messages" circulated on the day of the disaster, saying that the "Titanic" was steaming to Halifax. On their basis, the ship was reinsured at London. Not until evening was the horror of the true facts known ashore to outsiders.

Congress In the Senate a bill appropriating \$20,000 for the proposed international inquiry as to the cost of living has been passed; also an immigration bill which provides that all male alien immigrants must be able to write as well as to read, and authorizes the deportation of aliens who conspire here for the overthrow of a foreign Government. The prominent subjects of debate this week will be the tariff bills sent over from the House. A vote in the House upon taking up the bill for incorporating the proposed Rockefeller Foundation indicates that the measure will be defeated there, but may not be considered at this session. A House committee has ordered a favorable report upon a bill designed to forbid and prevent "future" trading in cotton and grain. The Naval Committee has voted that there shall be no appropriation this year for new battleships or cruisers, thus following the decision of the Democratic caucus. A vote providing for debate indicates that the House will provide for a parcels post. The House has passed the Henry bill, which requires publicity for contributions and expenditures made in the interest of candidates for a Presidential nomination.—Julia C. Lathrop, associated with Jane Addams in the work of Hull House, in Chicago, has been appointed chief of the new Children's Bureau.

National Politics At the end of last week Mr. Taft had about 380 delegates and Mr. Roosevelt about 210. These are the figures generally accepted, altho it should be said that they do not accord with those of Mr. Roosevelt's campaigners, who concede a comparatively small number to the President, on account of the many attempted or actual contests. Mr. Roosevelt was notably successful in Nebraska, where he had at least three times as many primary votes as were cast for Mr. Taft, and in Oregon, where he had a large majority. To the President were given the votes of Connecticut and Delaware. Mr. Roosevelt was also victorious in West Virginia. It was reported that at least a score of Southern

delegates instructed for Taft had privately announced their intention to vote for Roosevelt.—A statement filed at Albany by the Roosevelt managers, as required by law, showed that \$59,126 had been expended in his interest at the primary election in New York County, and that among the subscriptions to the fund thus used were \$15,000 from George W. Perkins, \$15,000 from Frank A. Munsey and \$15,000 from Alexander S. Cochran. Mr. Taft's manager pointed out that Mr. Roosevelt's votes in the county cost about \$3.50 apiece; that Mr. Perkins was connected with the Steel Trust and Harvester Trust, and that Mr. Cochran, a millionaire manufacturer, was interested in the duties on manufactures of wool. He also asserted that large sums had been used for Mr. Roosevelt in Oklahoma, Illinois, Pennsylvania and elsewhere.—The contest between Mr. Taft and Mr. Roosevelt became very acrimonious. The latter asserted that the President acquiesced in the use of tools for dirty work and repeated other charges made at earlier dates. Mr. Taft's manager accused Mr. Roosevelt of mendacity, the use of an alliance of crooked business with crooked politics, and of planning to wreck the party. The ex-President was also called an arch-demagog and an arch-traitor in statements issued by the Taft campaign bureau. The President will make several speeches in Massachusetts, where half a dozen speakers from other States will work for Mr. Roosevelt. The latter says that if he does not win now, there will be war for three years.—William L. Ward, Republican National Committeeman from New York State and boss of Westchester, declares that Mr. Roosevelt will, however, be nominated in the first ballot cast at the Chicago convention; while rumors are current that William Barnes, Jr., of Albany, who has officially supported Mr. Taft, is planning to take the lead in a movement for a compromise candidate.—Speaker Clark carried the Nebraska primaries, and is leading, but not many of the Democratic delegates have been chosen. Mr. Underwood has the delegates of Alabama. Mr. Bryan has been speaking in Ohio against Governor Harmon,

asserting that the latter is Wall Street's candidate.

Trusts The Merchants' Association, of New York, in a memorial to Congress, asks for legislation that will end the uncertainty of business men as to the application and scope of the Sherman act. It suggests legislation on the lines of Canada's law. This provides that, upon complaint of six or more citizens as to a combination or corporation alleged to be existing and operating in violation of the statute, an investigation shall be made by a commission of three, one of whom is chosen by the complainants, another by the defendants, and the third by agreement of these two. The commission reports to the court.—A favorable report has been ordered in the House upon the Humphrey bill (approved by Attorney-General Wickersham), which excludes from our ports foreign ships found to be parties to combination agreements unlawful under the Sherman act.—The complaints against nine of the defendant corporations in the proceedings against the Shoe Machinery Company having been dismissed, the trial of the main company and ten of its subsidiaries will soon take place.

Labor Questions The 25,700 railroad engineers employed by fifty Eastern companies having received a final communication from the companies, declining to satisfy their demands for an increase in pay averaging 18 per cent., it was decided that the vote for a strike should be obeyed, and that action should be taken on Monday evening, the 22d. There was some hope that the companies would hold a conference on that day, but the general expectation at the beginning of the week was that the strike would take place. Small hope is entertained of arbitration thru the Government.—The strike at the mills in Lowell (Mass.) ended on the 20th, when 12,000 employees accepted the wage increase of 10 per cent.—In Lawrence, several of the strike leaders have been indicted for murder or for being accessories to such

a crime.—Many expect that an agreement as to the controversy in the anthracite coal mining industry will soon be reached.—A special committee appointed by the Steel Corporation has reported against the seven-day work week, and also against the twelve-hour day, suggesting conferences of all the manufacturers for an agreement that will make the workday shorter.

The Warning to Mexico A long reply to the emphatic warning sent by our Government to the Government of Mexico was received on the 17th. Its tone was such that some newspapers summarized it by saying that Madero had told this country to "mind its own business." Madero's Foreign Minister said that his Government had a full consciousness of its duties and had given no ground for doubt as to the sincerity of its determination to enforce the principles of international law:

"For these reasons the Mexican Government finds itself in the painful necessity of not recognizing the right of your Government to make the admonition which the note contains."

Where the rebels were in control, he continued, his Government would not be obligated on account of acts against the lives and property of foreigners, except as the United States would be under like conditions. But the military commanders had been directed to treat foreign prisoners in accordance with Mexican law and international practice. [This related to the threat of General Villa to execute summarily any American prisoner taken from Orozco's army.] The reply also said that Mexico could not be responsible for the acts of Orozco and criticised our Government for publishing its warning to him in the same official note that was sent to Madero. Mexican newspapers express anger, some of them saying our Government's note was bitter and impertinent. Orozco's reply was more satisfactory. He promptly granted the demands of our consul at Chihuahua, and promised to protect Americans. He also asked for recognition as a belligerent. Whereupon our consul was directed to demand the release of

two Americans who had been held in the Chihuahua jail for a month, apparently without just cause.—The expected battle near Torreon did not take place last week, but Orozco captured three towns in Sonora. Owing to the isolation of Americans in the northwestern States, our Government decided to send a battleship to the west coast. Conditions near the capital did not improve. Zapata has promised to hang Madero in the Chapultepec Park. An order to officers of our army to canvass actively for recruits excited some interest, but it was said at the State Department that nothing was more remote than intervention. At the Mexican capital two or three newspapers express a belief that intervention was near at hand. Rifles and ammunition were sent to the Americans in Guadalajara. Madero intends to increase his army by means of a bond issue of \$10,000,000. The American railroad conductors and engineers have ceased to work. Some were locked out and others went out on strike. They had protested against new rules requiring the use of Spanish, instead of Spanish and English, in all train orders and in examinations for promotion. They also asserted that Americans had wrongfully been dismissed or subjected to unjust discrimination.

The Islands Two delegations have come to Washington from Porto Rico. One submitted a petition asking for independence or statehood. The other, which protested against the removal of the duty on raw sugar, opposed this petition, asserting that neither statehood nor independence was wanted by the commercial, agricultural and manufacturing interests. In a letter to a member of the latter delegation who is the head of the island's Federation of Labor, President Taft said:

"As fast as the instinct and habit of self-government are acquired by the people at large, and no faster, the fullest possible measure of local and fiscal self-government should be granted."

The planters of Hawaii and the Philippines, as well as those of Porto Rico, are urging the Senate Finance Committee not to accept the House bill which makes raw sugar free. At one of the hearings

Delegate Quezon said the Philippines should be independent. He was reminded of a recent remark of General Edwards that in war the United States would not protect them. To which he responded that sufficient protection would be given by the balance of power in the Orient. Other officers, not agreeing with General Edwards, say that the new fortifications on Corregidor Island, at the entrance to Manila Bay, are impregnable.—The number of lepers collected and placed by themselves last year, in the Philippines, was 1,076. The number collected since 1906 is 6,481, and 3,043 of these are living.—Hayti's Government has formally exiled the entire Haytian colony in Kingston, Jamaica, alleging that the members of it are plotting against President Leconte.

Central and South America Secretary Knox, reviewing his recent tour, says the friendly efforts of the United States to aid the republics which he visited are opposed by two hostile forces. The first is misrepresentation of our attitude and purposes in the countries themselves, and the second is the influence of small coteries of interested persons in the United States who selfishly oppose reforms which would end political abuses in the republics. Ratification at Washington of the loan treaty with Nicaragua, he says, would give that country new life and hope.—Many arrests were made at Nicaragua's capital, last week, owing to the discovery of concealed arms and ammunition.—Our Government has been informed that Castro, formerly President of Venezuela, has returned to the Canary Islands. Some time ago he was in Colombia, near the Venezuelan boundary, attempting to start a revolution.—At the elections in Argentina, last week, the Radicals won a decided victory. Among the deputies elected in Buenos Ayres are two Socialists.—Friends of General Plaza, recently elected President of Ecuador, say that he will compel sanitary reform at Guayaquil, a port whose foul condition may menace traffic on the Panama Canal. General Plaza, after holding the office of President from 1901 to 1905, was an

exile for six years in New York, where four of his children were born.—The commission appointed by Mr. Taft to enlist foreign interest in the coming San Francisco Exposition sails from New York on the 24th. Among the members of it are John Hays Hammond, General Edwards and Vice-President Sesnon, of the San Francisco Chamber of Commerce.

France and Morocco When we announced that the Sultan of Morocco signed on March 30 a treaty establishing a French protectorate, full details were inaccessible. No wonder the treaty has been accepted in France as satisfactory. The Sultan accepts in advance:

"The administrative, judicial, scholastic, economic, financial and military reforms that the French Government will judge it useful to use in Moroccan territory."

The treaty of Fez completes the treaty with Germany of November 4, 1911, which recognized the right of military occupation "with the Sultan's consent," by stating that the Sultan will only have to be "notified" of such military measures. The French Government has secured the acceptance by the Sultan of the principles of its treaties with England and Spain, and the treaty of Fez announces that:

"The Government of the Republic will co-operate with the Spanish Government on the subject of the interests which this Government holds from its geographical position and by reason of its territorial possession on the Moroccan coast."

—A revolt in Fez, where the rebels were reinforced by mutinous Moorish soldiers, who besieged the Sultan in his palace, has been suppressed by the French, who numbered 4,700. The revolt was begun April 18, and was marked by pillage and the murder of more than one hundred Jews, thirteen French civilians, fifteen French officers and forty private soldiers. Some of these were killed in the streets, some in their homes. The cry was raised: "The Sultan is a prisoner of the French and must be liberated!" News of the outbreak was delayed because the rebels butchered the telegraph operators at their posts of duty.

The Dardanelles Bombarded

On April 18 an Italian fleet of four battleships and at least a score of smaller vessels, chiefly torpedo boats and destroyers, began a bombardment of the outer forts of the Dardanelles, which continued for about three hours. Apparently there was no thought of effecting a landing and there were no troops aboard the battleships. The Italians fired 180 shells at 8,000 yards. The forts replied, and it was rumored that one Italian battleship was sunk, but the Italian Government denies this. The Italians also bombarded the island of Samos, sinking a Turkish warship and seizing a royal yacht before retiring to their base at Lemnos. The Turkish Parliament was convened the same day, and, in spite of the disquieting news, there was perfect calmness. In the speech from the throne the Sultan said that peace could be restored only if Turkey's sovereign rights over Tripoli were maintained. That evening, announcement was made that the Dardanelles, being planted with mines, were closed to navigation. The Russian Ambassador at Constantinople protested, Italy and Russia having* apparently reached an agreement by the terms of which Italy will support Russian policies in the Balkans, while Russia will recognize Italy's sovereignty in Tripoli. A Constantinople dispatch states that the Turks will reopen the Dardanelles, Italy having disclaimed any intention of forcing a passage.—The Straits of the Dardanelles have not been the scene of naval warfare since 1856, when the Crimean War was terminated by the Treaty of Paris. The width of the straits varies from one to four miles, and the average depth of the channel throughout the more than forty miles of its length is 180 feet. The Dardanelles connect the Ægean Sea with the Sea of Marmora, and thus their control is essential if Constantinople is to escape bombardment. The straits have been fortified from the most ancient times. They are most strongly defended at the narrowest point, which marks the fabled crossing of Xerxes and Alexander, in 480 and 334 B. C. respectively. The actual strength of the fortifications is a much debated proposition. By

agreement of the Powers in 1841 the Dardanelles were closed to the warships of all the world except in cases where the consent of Turkey to their passage was obtained. This treaty was confirmed after the close of the war of the Crimea, and in the treaty of Berlin in 1878. The only time that the pact about the Dardanelles has been violated since England sent a fleet to help Turkey in its last war with Russia was during the Russo-Japanese War, when the Russian volunteer fleet cruisers "Smolensk" and "Peterburg," flying merchant flags, yet carrying soldiers and guns, slipped thru the Bosphorus and down the Dardanelles into the Ægean. Later the Czar repudiated this breach of faith.—The Turkish Government has voted \$100,000 and the Sultan will add \$50,000 from his private purse for the installation of a regular aviation service in the Turkish army.—It is said that the Porte has ordered the banishment of all Italians.—The Italians have established at the city of Tripoli a municipal government that seems to have proved itself altogether efficient. The boundaries of Tripoli Italiana have not, however, been materially widened since the final clearing of the oasis and the occupation of Gargaresh on January 20.—A new Hungarian Cabinet has been formed, George Luckacs succeeding Khuen von Hedervary as Prime Minister. The Prime Minister assumes the portfolio of the Ministry of the Interior and has re-appointed the ministers of his predecessor. He himself previously held the post of Minister of Finance, in which position he is succeeded by J. Teleszky.

✱

In the East One hundred and seven gold miners were killed and eighty wounded in a battle with Russian soldiers near Irkutsk, Siberia, last week.—The Persian situation is no more reassuring. The Russian troops have not been withdrawn from Tabriz, rebel forces still sweep the countryside, and commerce thruout a large part of the country is at a standstill. Fighting at Lhasa between Tibetans and Chinese is said to have resulted in the loss of some 3,000 lives on the Tibetan side. The Chinese used Maxim

guns. Within the boundaries of the republic riots are anticipated at Canton and elsewhere, thousands of discontented soldiers having been disbanded. Moreover, the famine continues to cost hundreds of lives daily thruout Eastern China. The United States, Great Britain, Germany, France, Russia and Japan have stopped payment of advances in the Chinese loan. The representatives in Peking of the "Six Power Group" have taken that action as a means of protesting against the signature of the loan by the Belgian syndicate. The Chinese Government has announced the probability that the syndicate will join the international group.—Bad news comes from Peking in regard to the counter revolution in the mountainous provinces of Shensi and Kansu, near the Mongolian frontier. The leader of the revolt, Sheng Yun, was the Tatar Governor-General of Shensi when the revolution broke out last October. Shensi has always been a conservative province, and anti-foreign; it was to the provincial capital, Hsian-fu, to which the court retreated in 1900, when the allies entered Peking after the Boxer uprising. Sheng Yun swears he will re-establish the Manchus on the throne or die in the attempt. He is a man of strong personality and prestige. He is himself a Manchu, with an added strain of Russian blood. He has raised an army largely made up of Mohammedans and numbering nearly 20,000, and is marching toward Peking, where he expects to be reinforced by the Manchu garrison of 20,000. Thousands have already left the capital in panic. Except for Yuan Shi-kai's bodyguard, almost the only troops in Peking are the old-fashioned soldiers of Chiang Kuei-ti. The loyalty of the Peking garrison is the less dependable since their pay is in great arrears. The object of Sheng Yun seems to be to enthrone the son of Prince Tuan, a young prince who before the Boxer troubles was recognized as the heir of Kwang Hsu, but whose claims were set aside on the insistence of the Powers, based upon his father's prominence among the Boxers.—A manifesto issued by President Yuan urges the five races to amalgamate thru intermarriage.

Perils of the Atlantic Ice Fields

BY ARTHUR SELWYN-BROWN, Ph.D., LL.D.

THE "Titanic" catastrophe has drawn attention to the dangers travelers upon the Atlantic risk at all times of the year. It has brought home these dangers in a more forceful manner than any previous accident. No year ever passes without mishaps occurring to ships thru contact with the ice one way or another, but the average person is so accustomed to accounts of such accidents that they are looked upon as ordinary perils of the sea, and the advertisements of the steamship companies to the effect that their various vessels are unsinkable and furnished with up-to-date life-saving appliances have induced a false sense of security in those who voyage across the Atlantic in modern liners. The tragic loss of the "Titanic" on her maiden voyage will

awaken more interest in the study of Atlantic ice movements, and will doubtless lead to better precautions being taken to prevent accidents thru ice, both by Government action and by steps taken by the shipping companies.

There are three principal forms in which ice is met with in the ocean. They are known as slob ice, field ice and icebergs. All, in certain circumstances, are a menace to shipping; but field ice and icebergs are the most dangerous.

Slob ice is formed, during the winter months, in river mouths, bays and straits along the shores of Labrador and Newfoundland. It is a true sea-ice, formed in sheets or isolated circular masses. The sheets are broken up by wave and tidal movements into innumerable pan-shaped fragments, which are wafted sea-

OFF CAPE HARRISON, LABRADOR

The cod-boat shown here is making an early trip to the fishing grounds. The ice conditions are such as prevail along this coast during the spring months.

ward by winds and currents in the form of long, serpentinous drifts. In warm weather and when the sea is rough, slob ice is not very dangerous to navigation. But in freezing weather it is possible for ships running thru such drifts or floes to be frozen into a pack and ground to destruction by the working of the ice-mass. The slob, pan or young ice, as it is variously called, is most dangerous in the fall months or early in the year. In April, 1885, a sailing ship named the "Marance" was caught in a floe of this character and was so badly crushed that when the ice started to break up the vessel sank. The Newfoundland whaling steamer "Esquimaux" was caught in a floe of new ice that stretched southeast from St. John's for over 200 miles. Five other whaling vessels were held by the ice for nearly two weeks. These vessels, fortunately, were built to withstand the ice, otherwise they, too, might have been destroyed by the ice pressure.

Field ice is one of the most common

forms met with at sea. It is found in fields that are often of vast extent. This ice is caused by the freezing of the sea. Atlantic field ice originates chiefly along the coasts of Labrador and Newfoundland, but some of it comes from Greenland and other Arctic countries. It varies in thickness from a few feet to about 30 feet. Often when it has been much churned up by the action of waves, cake superimposed on cake, it may take on the appearance of icebergs.

Field ice is mainly formed on the surface of the sea. But it has been clearly demonstrated that some of it has come from the deep water. Field ice has been known to form thru the freezing of the ocean along the northern coast of Labrador at depths of from 12 to 20 fathoms. Seal nets set at such depths often contain seals firmly frozen over. Fishermen sailing off Nain, Labrador, some years ago found a pack of sea ice that carried a box of iron carpenters' tools that had been lost with a whaling ship crushed

ST. JOHNS HARBOR, NEWFOUNDLAND

This photograph was taken in the early spring a year ago and shows whalers and sealers amid the floating field-ice—to cope with which they are fully equipped

and sunk by the ice in Hudson Strait. Ice had formed around the tool chest at the bottom of the sea and had floated the chest. After being tossed by the waves and piled up on the top of the ice floe, it was a conspicuous object to the view of passing sailors. Indeed, numerous instances have been recorded of the sudden appearance of deep-sea ice around vessels. Steamers with light steel sheathing have often been damaged by deep-sea ice-sheets suddenly rising with such force as to pierce holes in the ship's bottom.

The source of icebergs is quite different to that of either slob ice or field ice. While the latter are formed in the sea from the freezing of sea water, icebergs are formed from fresh water in the interior of Greenland or other northern islands. The majority of Atlantic icebergs come from Greenland. Some also come thru Hudson's Strait and other northern channels, or from the sea pack in the Far North. The west coast of Greenland, however, between Cape Fare-

well and Disco Bay, supplies the majority of icebergs seen in the Atlantic.

The interior of Greenland is covered by a vast sheet of ice, which is in places many hundred feet thick. This ice is formed by the freezing of snow and rain, and sends out long tongues down the valleys and river channels until the sea is reached. When a valley is filled with ice, the ice-mass is known as a glacier. Many glaciers move rapidly and extend far into the sea in tongue-like projections. Glaciers sometimes move along their courses at a rate of from 50 to 100 feet per day of twenty-four hours. The famous Drygalski glacier, in the Antarctic, has a tongue projecting over 30 miles into the sea, averaging about 10 miles in width and several hundred feet in depth. Over three-fourths of this immense glacial mass is afloat.

The interior of Greenland is a dome-shaped ice-sheet, with an altitude of nearly 8,000 feet. This sheet is continually being fed by snow and rain. Its weight forces the lateral glaciers into

the sea in the form of vast ice tongues. The breaking up of such tongues results in the various iceberg forms we know.

Icebergs originate from glacier tongues in three ways. The end of the tongue simply breaks off from its own weight and floats seaward. Or the sea waves, beating against the foot of the tongue, undermine it until the weight of the overhanging ice causes it to fracture and fall into the sea. Or the motion of the ground swell of the sea may dislodge large blocks of ice from the base of the glacier and wash them out to sea. Icebergs are being made by these various means every day in the year, and the immense amount of ice that is thrown into the sea can be appreciated when we remember that a single glacier has yielded over two hundred billion cubic feet of ice annually in icebergs.

Growlers and piedmonts are other types of icebergs. A growler is a small fragment of a glacial iceberg that has mingled with field ice and later, after migrating southward into warm water, becomes liberated and travels about alone. Piedmonts, as the name implies, are formed by snow banking up at the foot of a mountain or hill. In Greenland, blizzards pile the snow at the foot of the steep hills near the coast hundreds of feet deep. This snow becomes solid ice which in time moves out to sea, where it often forms great ice cliffs, rising hundreds of feet above the sea and extending around the shore, a gigantic ice barrier for many hundreds of miles. These cliffs break up eventually into innumerable icebergs.

The ice moves in a regular manner from the northern seas toward warmer regions. It starts from Greenland in May and from Newfoundland in December. A good description of the starting of the slob and field ice from Greenland is given by the explorer Sverdrup, in the first volume of his "New Land." He says:

"We first became aware of the proximity of land on the afternoon of Sunday, July 17, 1897, after a day's bad rolling. . . . Far away in the west, on the horizon, we observed a light shining in the sky, sulphur yellow in color and visible under a dark bank of clouds. It was the reflection of the 'Inland Ice,' the so-called ice-blank; and deep below it lay Greenland with its ice-desert and eternal snows. . . . It was not long before we dis-

covered the presence of ice shining in the distance and soon we were in the midst of the drift-ice, which the strong polar current carries southward down the east coast of Greenland. This was the sea-ice itself, which appears in enormous masses, and covers the sea with a belt extending several miles from the shore.

"Millions of small floes and hummocks came floating heavily along; hundreds of icebergs were among them, and all were shaped by the magic touch of frost and sea. Every color imaginable was playing on them as they passed in an endless confusion of fantastic forms and I am prepared to say that there was not a thing between heaven and earth whose counterpart is not reproduced by the mighty fantasy of the cold.

"There sails a church with tower and spire, and rainbow colors from out the deep-set windows; there a giant ogre with his head under his arm, fast frozen to his floe; there lies a sleeping princess in a snow-white garb, outside a dangerous blue grotto, while a little further off sits a wolf on guard. Far away, touching the sky, rises the ice-king's castle on steely blue and green-glinting pillars, and near it a huge dragon thrusts up his strange head from the murky sea. To windward drifts a time-old pressure-ridge like an enormous relief-map of the primeval ice period; to leeward is an Alpine landscape in miniature with tapering peaks, black abysses and sunny green valleys. Round about, among these colossal figures, Nature, with her inexhaustible creative power, has scattered all sorts of smaller objects. . . . Across the whole of this desert fairyland the sun shone golden and warm. The floes were bright emerald green under water and upward as far as they were reached by the wash of the sea, while above the water-level was the glittering white snow. As we advanced into the ice, the floes became closer, bigger and more uniform; sometimes they were of a dirty gray color, arising, I think, from their having formed the bottom of fresh water pools where deposits of various kinds are apt to collect. Now we began to see seals. They lay singly or in couples, basking on the larger floes."

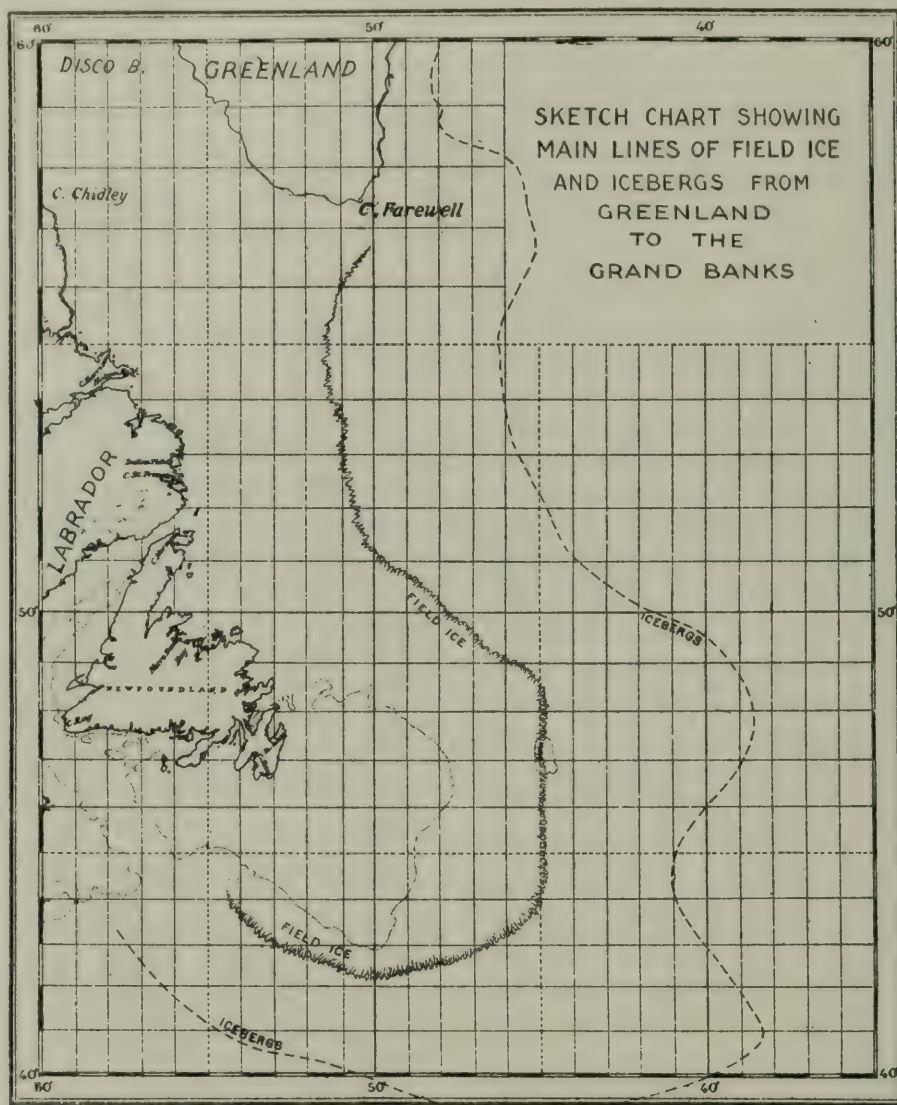

It was in bright sunlight that Sverdrup saw the birth of the field ice and all its beautiful shapes and colors. It presents a much less cheerful aspect, however, when seen at night or in stormy and foggy weather.

The ice thus starts in Greenland and is carried by the Labrador current and by winds and tides down the Labrador coast until the field approaches Newfoundland, where the pack divides, one part going thru the Strait of Belle Isle into the Gulf of St. Lawrence, the other skirting the north shore of Newfoundland and passing by St. John's and Cape Race, hangs around the Grand Banks until scattered by storms in various

directions. The greatest ice fields are encountered south of Newfoundland between January and August each year. But small masses and single icebergs may be seen any day in the year.

Every kind of ice is, of course, dangerous to shipping. Icebergs, however, are the worst foes ships encounter.

ships, was fitted with fifteen watertight bulkheads or collision compartments, and was in consequence held to be unsinkable. Had she collided with another ship or an object that would have yielded to the impact of the collision, the vessel would doubtless have continued to float. But she was moving with a gigan-

There are no certain means by which their approach can be discovered. The excellent "pilot charts" issued each month by the United States Hydrographic Office indicate the ice reported by ships in the previous month and its probable course. Thermometers automatically recording the temperature of the sea water give a strong warning of approaching ice, while the appearance of fog, and echo recorders that register the kinds of echo reflected by a fog or ice-mass, reduce the danger of collisions.

The "Titanic," like all first-class mail

tic momentum—a mass of over 60,000 tons propelled thru the water at about 20 knots per hour—when, like a mountain of steel, the bow ran against the ice and broke the vessel's framework so that all the bulkheads were strained. The constructors of modern liners aim to make the hulls as light as possible. They make the framework and sheathing of the ships just strong enough to bear the strains due to the weight of the vessel's displacement and the vibration of the machinery. No thought is given to strengthening the ships to withstand

the ice. It required an accident like the wreck of last week to indicate that, in future, steamships built to engage in the Atlantic trades should be strengthened at the bow, like whalers and steam sealing vessels, safely to encounter ice.

The disaster will also call for a reform in the practice of lookouts at sea. At present only one or two sailors are placed at the bow, in addition to the men on the steering bridge, to keep a lookout. That is ample on a small and slow vessel, but quite inadequate on a great greyhound of the ocean.

The life-saving appliances must also be attended to. Modern liners are extremely defective in this obvious necessity. The "Titanic," accommodating 3,500 persons, had only sixteen lifeboats, that could hold only fifty persons each when crowded. In future, the top or boat deck of passenger steamers should be formed of wooden rafts that would be automatically launched in the event of the vessel foundering, affording accommodation for hundreds of persons.

The United States Government has the facilities for establishing an ice patrol and information service that would be of inestimable value to navigators. It should, at least, have the Grand Banks of Newfoundland and the worst parts of the northern course properly patrolled

by naval vessels thruout the year. Congress will soon deal with this matter.

Little study has been given to ice and ice movements. The knowledge possessed by seamen of these dangers of the Atlantic is meager indeed. One result of the loss of the "Titanic" will be the investigation of ice movements in both the Atlantic and Pacific oceans. The United States Hydrographic Office has already started to map all the information it possesses of ice movements in the North Atlantic, and later in the year it will publish a map of the ice tracks and what is known of ice movements. But better observations and more scientific study than has up to now been given are required, before the dangers of the Atlantic can be minimized.

Sad as the "Titanic's" accident is, a startling event was required to attract attention to reforms needed in navigation; reforms that the changes lately made in the size, power and speed of transatlantic vessels loudly called for. There is little doubt that far-reaching reforms in the structure, management and navigation of passenger ships will now be instituted, and the loss of the great White Star liner may very well mark a new epoch in the history of transatlantic travel.

NEW YORK CITY.

Together

Titanic, April 15, 1912

BY SOLOMON SOLIS COHEN

"Loving and loyal were they in their life—
And in their death they were not divided."

David's Lament over Saul and Jonathan.

I CANNOT leave thee, husband; in thine arm
Enfolded, I am safe from all alarm.
If God hath willed that we should pass, this night,
Thru the dark waters to Eternal Light,
Oh, let us thank Him with our latest breath
For welded life and undivided death.

PHILADELPHIA.

“What Is the Matter with Sunday?”

BY MARION HARLAND

WHAT is the matter with Sunday?

No one can doubt something is wrong about it who pays heed to the talk bestowed upon it. Sunday cannot be mentioned in any general company without receiving an ill word from some one.

“Stupidest day in the week!” growls one.

“I always have a grouch on Sunday,” volunteers another.

“Nearest thing I know to a funeral,” comments a third, “except that the funeral is a trifle more cheerful!”

The most charitable thing the average speaker can offer is the verdict that Sunday is “deadly slow.”

Now, I may be putting myself on record as being personally stupid, funereal or slow when I venture to express my liking for Sunday, but fairness to a much belabored day leads me to do it. I say frankly that I enjoy Sunday! It does me good thru and thru to feel that there is one day in the week when conscience and inclination join forces in putting a check upon the work which sent me tired and fagged to bed on Saturday night. I like the unlikeness of the day to the other six of the week; the leisurely breakfast; the hour for family letters; the time for a little chat; the opportunity to meet and become acquainted with the members of my family when we are not all rushed by our respective employments. Most old-fashioned of all, the taste which marks me as a hopeless “back number”—I like going to church!

In the present day I feel almost as tho I should apologize for my taste and urge in extenuation the fact that I was trained to it from my early infancy. In my young days there were no children’s sermon, no rushing home from Sunday school as soon as the exercises were over, or tarrying for the brief address the pastor had prepared for the children, and then leaving the church heading a stream

of grown-ups whose powers of endurance were apparently in the infantile stage.

“It requires as many people nowadays to take one child out of church as to take one infant into the circus,” some one said in my hearing the other day.

But this not a talk on the question of children forming church-going habits at the same stage of their growth as when they are forming other habits which are to guide them in maturity. That is a subject on which I have strong convictions, but I shall not air them now. I am trying to find out what is the matter with Sunday.

One of the first points I should like to have made clear is the period at which people began to find out that Sunday had anything the matter with it. I cannot recollect that there were diatribes uttered against it in my youth. Yet I shudder to think what the youth of today would have thought of those Sundays!

Those were the times before Sunday school libraries were invented, at least, in the section of the country where I lived. In no part of the land were there children’s Sunday books to be found. In those hours of the day which were permitted for the diversion of reading, we had volumes of “memoirs,” such staid tales as “Anna Ross” (does any one now know anything about “Anna Ross”?)—and others by Grace Kennedy. “Nathan Dickerman” and “Little Henry and His Bearer” were then in their prime; “The Dairyman’s Daughter” and “The Young Cottager” were our ideas of Sunday reading. What would the young people of the twentieth century say of being limited to such books? They would have to invent intensives of the present epithets they bestow on Sunday!

I was not an exceptional child in my liking for Sunday, even in those days. My sisters and brothers felt it no hardship to go to church, to have the Bible lesson, to read the Bible, even to learn the catechism! We saw more of our

parents on Sunday than on the other days of the week and they felt it their duty to devote themselves to our religious instruction then. We took it for granted, and the idea of feeling ourselves ill treated because Sunday was made unlike other days would never have occurred to us. That very unlikeness endeared it to us.

As we grew up Sunday modified a trifle, perhaps, but this may have been due to a change in circumstances. We removed from the country to the city, and the long drives to church were over. We met our friends on the street instead of on country roads. We never "entertained" on Sunday, but the stranger was made welcome to our family meals. Our attendance at church and Sunday school was as regular as before, our observance of the religious character of the day was as constant as it had been before we came to town to live.

In my memory there was nothing dull, funereal or deadly about those Sundays of my growing-up days. We were a large family and never lacked interests in ourselves, but none of us yearned to introduce secular enjoyments into our Sundays. I cannot recall that the households where I was most intimate differed from ours in this respect.

When I married and my children were growing up about me, we kept our Sunday as we had always done, and the only variations were those introduced by circumstances. As in my girlhood days, there was a place at our table for a friend at the dinner or supper, and altho we kept to the old rule of drawing a line between "Sunday reading" and that indulged in on weekdays, there was never any inclination to rebellion or protest. I provided good books for my children—by this time the Sunday school library had come to stay, and children's story-books were many and good—and the "every day books" were laid aside on Saturday night with toys and tools. "Sunday must be different!" And with us all it was the best day of the week.

Still, I did not meet the class who thought anything was the matter with Sunday! I am inclined to think they are a recent development, and altho I try to keep up with the procession and in the

line of the thought of today, I cannot say I feel myself drawn to this manifestation of progress—if it be indeed progress.

One thing I have noticed about the critics. Those who are loudest in their denunciations of Sunday are precisely the men and women who make least difference between its character and that of the other days of the week. Isn't it possible that "the matter" is with the grumblers themselves, and not with the day?

Let us look at the complainers for a moment. How do they spend Sunday?

They usually begin by lying abed late. To that I have no objection to offer if it is done in moderation. If a man can get an hour more sleep on Sunday morning than he does on weekdays, I am glad he should take it. It is a day of rest and he is following out the purpose of the seventh-day pause. But he defeats the end in view if he spends his morning in bed. Try it yourself and see. Compare your feelings on the day when you rise somewhere between 8 and 9.30, and that on which you lie still until high noon. On the second occasion you get up feeling, in current colloquialism, like a "boiled owl."

When the drowsy one finally rises, how does he put in the rest of the morning? Usually he begins by eating a much heavier breakfast than he is accustomed to on other days of the week. Then he settles himself with the Sunday paper and relaxes his brain over the sporting news, or the financial column, or whatever else the journal has to offer him along the line of his daily interests. He doesn't change his current of thought and gain rest in that way. Not at all! He puts his mind back into its regular work-day groove.

His next step is to eat a heavy midday dinner instead of the light meal he usually takes at noon. Dishes to tempt his appetite are not lacking—the Sunday dinner must be especially good, in accordance with time-honored custom. After it, no wonder that a man feels that a smoke and a nap are essential. He takes both and then, perhaps, if the day is fine, he goes out for a stroll, from which he returns to a cold supper to which he does full justice. On dietetic

grounds alone is there any marvel that he thinks something is the matter with Sunday?

I do not mean to assert that this is the regulation Sunday of every one, but isn't it a pretty fair picture of the way in which many people spend the day? Of course, it is different if they own automobiles! Then they may not think so much is the matter with Sunday, but I am under the strong impression that Sunday thinks something is the matter with them!

I should be making a claim for myself I have neither the power nor the inclination to put forward if I attempted to provide any fixed outline which would make Sunday pleasing to every one. But one point I would like to present. Is not part of the trouble with the animadversionists against Sunday that they are seeking pleasure too vigorously? Happiness, like opportunity, is bald behind, and the best way to lay hold of it is not by a pursuit and a clutch.

We have done away with the Jewish Sabbath, the Puritan traces of which hung around our earlier Sundays, but it would do no harm to go back to one line of the prescription offered the Hebrews for making their Sunday pleasant. Close after the clause, "If thou . . . call the Sabbath a delight," come the provisos concerning "not doing thine own ways or finding thine own pleasure." If the impatient ones who find the Sabbath a bore would perhaps try for a while what they could make Sunday mean to others—beginning with the churches—it is within the bounds of possibility that a little delight might come their way!

Consider for a moment what a Sunday might be conducted from this standard. Your morning rest, your leisurely breakfast, are not debarred you, but they are followed by church, with all that this may mean of help and uplift and worship. The dinner that succeeds will not be the strain it would be upon the stay-at-home. In the afternoon may come

the rest, the reading of some of the wonderful things religion and philanthropy and social service are doing for the world, and the nap, too, if you want it, and the walk, or the afternoon service, or the call on the sick or lonely friend, or the hour given to cheering effort in a hospital or other shut-in institution. You will have an appetite for your supper, then, and be ready to give the evening to your family or even to attend church again.

Do I hear a protest, "But I am tired on Sunday?" Are you more rested after the kind of Sunday you generally spend? Isn't it worth while to try the other and see if it won't be a little better?

"But I work all the week!" I was expecting that. Let me just say that if you will look about you you will find that the persons who do the work of the Sunday schools and the churches are the very ones who are hardest at labor all the week. The complaints about the things that are the matter with Sunday usually come from the people who are too young to know what fatigue really means. The toiling fathers of households, the mothers who have their hands full six days a week, are those who support the church and the prayer meeting and the Sunday school and the philanthropies. Look about you and see if I am not right.

I don't often use slang, but there is one phrase I want to employ just here and now. If our children and young people find something the matter with Sunday, it is "up to us" who are mothers to change conditions. Make the Sunday in your home a delight. Talk with your children; give yourself to them; encourage them to give themselves to you; welcome their friends to the Sunday dinner or supper; show them how to make Sunday a day of service and joy to others as well as a help in their own growth. Start them right and the next generation will hear less about anything unlovely and dull and deadily being "the matter with Sunday."

NEW YORK CITY.

The Third Term Tradition

BY JAMES SCHOULER

[On November 7, 1907, Mr. Schouler published an article in *THE INDEPENDENT* under the above title. When we asked him if he would care to write something again on the subject, he replied that the previous article covered the ground pretty fully, and he only cared to add what follows. It is hardly necessary to add that Mr. Schouler is one of the most eminent living American historians, and is the author of the well known "History of the United States."—EDITOR.]

THE effort to break, at the present time, that well-founded custom which limits each President to two possible terms of office, or one reelection only, is applied where an ex-President has been in actual retirement and the proposal is to return him after an intervening incumbency. In this respect the present case of Theodore Roosevelt is like that which the Republican party was forced to consider in 1880. Ex-President Grant was pressed for nominee of the convention that year, that he might be chosen to succeed his own successor. But in two important respects General Grant's claims for such unprecedented distinction were far stronger than those now urged on Roosevelt's behalf. (1) Military savior of the Union, he viewed his services from a professional standpoint, like other great commanders, such as Marlborough and Wellington, and having sacrificed supreme command in the army, which would have assured him a handsome salary for life, when called to the Presidency, he always felt that the nation owed him its utmost indulgence in the briefer tenure of Chief Executive. (2) President Hayes, in view of the disputed title to his own election, had pledged himself to serve but a single term, and consequently the succession stood wide open. But Roosevelt's public career, tho an honorable one, affords no exceptional claims to justify a gift from

the people beyond all predecessors in supreme office. And President Taft, moreover, unlike Hayes, not only deserves the usual courtesy of a renomination from his party because of faithful and efficient services, but earnestly desires it.

In three instances only has the influence and popularity of a retiring President, in our history, enabled him, at the close of his eight years' administration, to place in the executive chair a successor of his own selection. By two of these—Jefferson and Jackson—such a privilege was deemed a final and a crowning one. Roosevelt was the third to be thus fortunate, and to turn now upon that chosen successor, to snatch from him the well-earned prize of party recognition for his own ambitious readvancement to leadership, calls for stronger grounds of justification, on the score of honor and generosity, than have yet been put forward.

I hope we may yet see our Constitution amended so as to embody this ultimate limit of two terms in its written text. The trouble with former suggestions on the subject has been that single-term limits, longer or shorter, have been proposed, by way of experimental change, while public opinion, content with present conditions, prefers simply the permanent expression of our constant custom.

BOSTON, MASS.

Japan Today.—I.

BY HAMILTON HOLT

[Mr. Holt, our managing editor, has just returned from a three months' trip to Japan. Mr. and Mrs. Lindsay Russell, of New York, and Mrs. Holt accompanied him. Mr. Russell is the founder and now the president of the Japan Society of New York and Mr. Holt has been a member of its executive committee ever since its foundation. As both men have taken a prominent part in all the activities of the society, including the entertainment of the leading Japanese who have visited America during the past few years, and as both have received decorations from the Emperor of Japan—Mr. Russell for his efforts in up-building the Japan Society and Mr. Holt for his work for international peace and the promotion of more friendly relations between Japan and the United States—they were the recipients of much attention and hospitality wherever they went. We have already reprinted for our readers the substance of two of Mr. Holt's addresses in Japan, one on the peaceful relations between the two countries and the other on international journalism. This article will be followed by two others.—EDITOR.]

A MAGNIFICENT banquet was being held in San Francisco to speed home a departing Japanese hero. An American speaker was eloquently expatiating on the marvelous progress that Japan has made in recent years in all the arts of civilization, when a guest down the table whispered to his Japanese neighbor, "Yes, and the truth is, we Americans are just beginning to find it out."

It was to "find it out" that our party of four—just the right number for such a pilgrimage—journeyed to Japan, Korea and Manchuria. Mr. Russell was especially anxious to survey present and prospective commercial and financial conditions. I wished to learn all I could of the foreign policy of Japan, with especial reference to the United States and the peace of the world. In the eight short weeks we spent on Asiatic soil we visited the principal cities of Japan, including the present capital, Tokyo, the ancient capital of Kyoto, the modern commercial marts of Yokohama and Kobe, and the Chicago of Japan, Osaka, with its great manufacturing plants.

We visited the shrines and temples at Nikko and Nara, the Castle at Nagoya, the mountain country about Miyanoshita and the lakes of Hakone and Chuzenji.

We even took a trip to the country, away from our friends and hospitalities, and visited primitive little farms and villages where we were told that foreigners had never been seen before. We sailed thru the isles of the inland sea, past Miyajima of the matchless Torii, out thru the Gibraltar of Japan, guarding the twin cities of Moji and Shimonoseki. Thence we crossed over to Korea, traveled up thru the center of the peninsula to Seoul, then on again to the Yalu River, and thence to Mukden, the capital of Manchuria and now the center of the heart of the Far Eastern question. From Mukden we took the train southwest to Dairen, the old Russian Dalny; then, after a day at the battlefields of Port Arthur, forever hallowed by the blood of the heroes who fell there, we sailed across the Yellow Sea back to Japan, and after another week at Tokyo, returned home.

Of course, only the most casual impressions could be received. The hurried traveler takes in only differences and oddities, which are always superficial. A real understanding of a country is possible only after a very long sojourn in it and much study. All I can hope to do, therefore, is to give such an impression as any one is likely to get

after making a brief visit to the country under very favorable auspices, and talking with all sorts and conditions of people. Even then my impressions may be erroneous, for I never in all my life was in a place where so many different opinions and explanations were offered me about the same thing, and naturally I did not have the time to verify or the knowledge to weigh the testimony given.

There is now no doubt that Japan in the last forty years has made in most fields the progress that it has taken Europe one thousand years to perfect. In order to understand the reason for this, it is necessary to go back to 1868, when the Emperor was restored to power on the ruins of the Shogunate. This peaceful revolution, one of the most remarkable in the history of the world, left Japan with two national policies and aspirations, which she has adhered to with unswerving fidelity ever since.

Her first purpose was to maintain her national integrity or independence. Her statesmen saw, at the beginning of the new regime, that if she did not adopt the Western ideal of civilization she would inevitably suffer the fate of other Asiatic Powers and be divided among the land hungry nations of the Occident. Her second great purpose followed. It was nothing else than the ambition to make herself the equal of any civilized nation. To carry out these two purposes of integrity and equality, the old feudal system was broken up and a constitutional government along Western lines established; the caste system, almost as rigid as that prevailing in India today, was abolished; and the Samurai, or warrior class, were forced to lay down their arms, while an army and navy that now ranks with the greatest was built up on the basis of universal conscription. Realizing, furthermore, that no nation can today reach real national pre-eminence on a purely agricultural foundation, Japan at once started in to foster commerce, industry and manufacturing. The hitherto despised merchant class was raised to high respectability and esteem, even some of the leading financiers being elevated to the nobility.

In addition to this and of even greater importance, a system of universal education based on American ideals was

introduced, while all the arts and sciences were fostered by Government aid. With the remarkable quickness and thoroughness characteristic of these people the whole political, social and economic system was completely changed within a generation.

Of course, these profound changes were not brought about without internal and external friction. At home there was discontent and even a few rebellions. The latter, to be sure, were put down without much effort. Abroad, however, Japan was compelled to engage in two great wars, first with China, then with Russia. Both wars were essential to her integrity. Both were for self-protection, not aggrandizement.

The greatest modern statesman of Japan, the late Prince Ito, said that Korea was a dagger pointed at the heart of Japan. When China began to intrigue with Korea against Japan, Japan fought China. But no sooner had China's influence been destroyed in Korea than Russia came down from the North and took China's place, so Japan had to fight Russia. As the fruits of victory Japan fell heir to the rights of Russia in Manchuria that had been previously granted Russia voluntarily by China. These included the ownership of the South Manchuria Railway and concessions of land along the line, and the cities of Port Arthur and Dairen. As the utterly corrupt and supine Korean Government still continued to intrigue against Japan, Japan found the only recourse left her was to step in and have all Korea's foreign affairs conducted thru Tokyo. But as Korea still continued to intrigue abroad and was unable to keep order at home, Japan finally, by an imperial rescript of August 29, 1910, annexed "the Land of the Morning Calm," and from that moment set about to make Korea an integral part of the Japanese Empire.

Japan therefore has achieved her first great national purpose. Her independence is assured. She owns Korea, which is the key to Japan, and the South Manchurian Railway, which is the key to Korea. With these strategic advantages, and with a superb army and navy, she is safe from any invading force likely to be brought against her.

Having attained her first main purpose, how far has she got toward accomplishing the second? Is she today the equal of the foremost world Powers in the arts of peace and civilization? If I can trust my own observation, I should say that Japan has now practically nothing more to learn from Western civilization except in four departments—the ethics of business, the legal status of women, the organization of labor and the extension of the suffrage. Of these deficiencies Japan is actively conscious. The knowledge is half the battle won, for the Japanese can do everything well that they have a mind to do at all.

Before taking up these deficiencies, however, let me discuss those other phases of activity where Japan undoubtedly excels. And first I shall take up the Government.

I do not know how Japan's Government ranks with those of other nations, but of this I am sure: No Government in the world commands more genuine respect from the people, and none can be more solicitous of the prestige of Japan abroad and the welfare of the people at home. The Government consists of the Emperor, the unofficial body known as the Elder Statesmen, the Privy Council, the Cabinet and the Diet. The Emperor is supreme. Between him and his subjects the line has been drawn for approximately twenty centuries. As Prince Ito says in his "Commentaries":

"The Sacred Throne was established at the time the heavens and earth became separated. The Emperor is Heaven descended, divine and sacred. He is pre-eminent above all his subjects. He must be revered, and is inviolable. He has indeed to pay due respect to the law, but the law has no power to hold him accountable to it. Not only shall there be no irreverence for the Emperor's person, but also shall he not be made a topic for derogatory comment nor one of discussion."

It is a credit to the Emperors of Japan that thruout history they have almost without exception shown the greatest consideration for the people. The people on their part have shown loyalty, even unto death, for their sovereign. The relations of Emperor and people may be likened to those of parent and child. The people worship the Emperor and the Emperor his own ancestors. The present Emperor, therefore, is the living embodiment of past traditions and future

aspirations of the Japanese people, and is "the heaven-born link between old and new Japan."

This transcendentalism of the Emperor is very difficult for an American to understand, our political theories being based on such different fundamental conceptions. But the reverence shown him is entirely sincere, and certainly no living ruler has done more to deserve it than the present Emperor.

The Emperor is surrounded and supported by the Privy Council, whom he appoints on account of their special knowledge or experience. They are his personal advisers. They are a deliberative body solely, and their decisions may or may not be adopted. The councillors of the Emperor, however, on whom the Emperor places most confidence, are the *Genro*, or Elder Statesmen. This group of leaders have been his trusted advisers almost from the beginning of the Restoration. Tho constantly dwindling in numbers, they have been essentially permanent in personnel and ideas, and it is to them that credit is largely due for guiding Japan in its progress from the old to the new civilization. As Professor Reinsch points out:

"They have combined great foresight in matters of international development and foreign intercourse with constructive talent which has enabled them at the proper time to create the means and measures for domestic progress. All this they did under the weight of constant popular opposition and misunderstanding."

Since the death of Prince Ito they consist of but three—Prince Yamagata, Marquis Matsukata and Marquis Inouye.

The Ministers of State seem to be the real executives of Japan. They are ten in number—the Prime Minister, Ministers of Foreign Affairs, Internal Affairs, Finance, Army, Navy, Justice, Education, Agriculture and Commerce, and Communications. They are advisers to the Emperor and proclaim his decrees and administer public affairs. Each minister is responsible to the Emperor for the conduct of the business in his department, and altho all the ministers deliberate together in a cabinet, they are not jointly responsible. They are appointed directly by the Emperor and hold their tenure of office at the imperial pleasure. This ministry is quite unlike

the British Cabinet, which does not manage its affairs individually, but which has a joint responsibility to the Crown.

The Emperor opens, closes and pro-rogues the Imperial Diet and dissolves the House of Representatives. When the Diet is not sitting the Emperor may issue imperial ordinances, which are law until not approved by a special vote at the next session.

The Constitution differs from those in many other countries in that it was not granted under duress or coercion, but as a free gift from the Throne to the people. Accordingly, while the people are granted safeguards to protect their honor, liberty, life and property, and freedom of religious worship, etc., the powers of the Emperor remained unimpaired and even strengthened.

The Diet consists of two chambers, the House of Peers and the House of Representatives. The House of Peers includes sixteen princes of the blood, thirteen princes, twenty-nine marquises, seventeen counts, seventy viscounts, fifty-six barons, one hundred and twenty-two imperial nominees (for distinguished service in war and peace), and forty-five representatives of the highest taxpayers.

The House of Representatives consists of 379 members elected by popular vote. The Diet is not nearly as powerful a body as many other world parliaments, but it would take too long to enumerate its specific powers and limitations. While there are now three parties in Japan, they do not command anywhere near the prestige or influence that parties have in, for instance, England, France, Germany and the United States. The chief political interest of the people is centered in the Ministry and the Privy Council, which is the real power behind the throne.

Whether this absence of a strong parliament is a benefit or weakness to Japan I do not express an opinion. Altho foreign relations can be handled with great secrecy and expedition, and various internal improvements can be hurried thru with extraordinary dispatch, it is very doubtful, as Professor Reinsch has pointed out, "whether the principle of authority alone can ever be the basis for a state life, even tho the authority be

exercised with great wisdom and justice."

But loyalty, after all, is a sentiment. Can a thoroly educated people be ruled by anything in the long run but by their collective reason? According to all Western analogies the loyalty of the Japanese people to the Government must wane with the years. But this argument goes on the assumption that the Government will abdicate its leadership of the nation under the growth of universal education and democratic ideas. It may be so. But certainly the whole history of Japan, both before and since the Restoration, shows that the Government, while keeping in close accord with popular opinion, has originated, led and perfected every important reform. It would be the extremity of unwisdom to assume that the Government will not similarly lead the nation in the future, whether the goal be empire or democracy or some other state of society.

The leadership of the Japanese Government is nowhere better exemplified than in the progressive steps it has taken along the lines of State Socialism. It owns and operates the post office, telephones, telegraphs, wireless, gas, electricity, water, railroads and the tobacco, salt and camphor monopolies. It subsidizes many businesses such as shipping, banking, etc. Indeed, the ramifications of the Government are to be seen everywhere. Japan has gone into these socialistic measures, however, not from any conversion to the tenets of Socialism, but because she has wanted to make money. A good part of the national income comes from the operation of public utilities and monopolies. Nevertheless, Japan today approximates more toward what is known as State Socialism than any other nation in existence.

I have been asked whether the Japanese Government officials are corrupt, like those of many other nations. It seems to be the general opinion that they are not. Scandals, of course, there have been. But the officials maintain a high standard of honesty, probably superior to that obtaining in most nations.

The educational system of Japan is modeled on American ideals. Two generations ago only 28 per cent. of the children of school age attended school. In

1893 the percentage rose to 59 per cent. Today it is 98 per cent. Universal education has been in existence for about thirty years, and now every child must go to school for at least six years. Today there is less illiteracy in Tokyo than in Boston. I was told by an American physician practising in Japan that Japan now probably has the best school system in the world, especially in the primary departments. I shall never forget the visits I made to some of the schools. Every classroom had a sunny southern exposure. The buildings were all one-story affairs, so that there would be no danger of death in case of fire. Every hour the pupils leave their rooms to go out of doors, where they practise athletics and calisthenics for a quarter of an hour under a professional instructor. You will always see, therefore, one-quarter of any school playing in the school-yard. All the boys in the secondary schools by law wear a military uniform and the girls a full pleated skirt, so as to allow free movement for the limbs, the national dress for women being in the nature of a hobble skirt. In the colleges and universities Japan is also abreast of the most modern methods of pedagogy. While higher education was originally best obtained in the Christian missionary colleges, now the imperial universities at Tokyo and Kyoto, and the great private universities, such as Waseda and Keio, far surpass the foreign denominational institutions. As one esteemed missionary states:

"The excellent methods that the department of education follows to inform itself of every new step of advance in education the world over and of thus keeping thoroly abreast with the times, finds no parallel in our Christian education. The Government schools constituting a vastly well organized system go forward with a momentum and a spirit that cannot be approached by the Christian schools."

In science, pure and applied, Japan is doing her share of the world's work. In sanitation—at least as far as the army is concerned—she leads the world. In surgery and medicine the Japanese have little to learn from Berlin, Vienna or Baltimore. An American doctor in Japan told me of a delicate ophthalmic operation he witnessed by a Japanese colleague which he thought the most

skilful he ever saw. Tho such an operation would have commanded \$1,000 in the United States, the Japanese surgeon's fee was 5 yen (\$2.50). All the Japanese doctors, however, do not make such reasonable charges, for once, when I summoned one to remove a fishbone that had lodged in my throat, he gave me a whole baked potato to swallow at one gulp and then sent me a bill of \$10. His prescription effected a cure, however, and I mention it here without charge, for the benefit of those who may be in need of a remedy for a similar uncomfortable predicament.

In seismology the Japanese scientists beyond question lead the world. As Japan enjoys an average of $3\frac{1}{2}$ earthquakes a day, and one severe shock every two and one-half years, it is easy to see that no opportunities are lacking for the study of this rather terrifying subject.

An old Japanese proverb runs, "Among flowers the cherry, among men the warrior." There is no doubt that the Japanese honor their army and navy more than any other national institution. It certainly receives more personal attention from the Emperor than any other branch of the Government. In case of war Japan can mobilize the army in eighteen days, and by calling on all the reserves could easily muster over a million soldiers in a very short time. On a war basis she would have an active army of 295,000, a reserve of 355,000, a second reserve of 745,000, auxiliaries more or less trained, 260,000, and territorial reserves, 110,000. In case Japan should have a war about 1920, it is estimated she could muster out 1,450,000 trained troops, 310,000 more or less trained, and 5,500,000 eventual combatants not yet trained.

The Japanese soldiers at present are among the best in the world, the officers know their profession thoroly and are passionately devoted to it. A manual put in the hands of every soldier reads:

"Living to be overwhelmed with the innumerable and immeasurable blessings of Imperial goodness; dead to become one of the guardian deities of the country, and as such to receive unique honors in this temple, is not this for a soldier the hight of glory? For this reason, soldier, you must scrupulously execute the orders of your chiefs. Remem-

ber each step toward danger is a step toward glory, and go calm and joyful; full of ardor rush to the field of battle where death awaits you."

This is the spirit that dominates the soldiers of Japan, as is clearly demonstrated in the heroism they exhibited in the two wars they have already fought to preserve their independence.

The navy is likewise loyal, brave and efficient. On paper it ranks fifth among the nations. In battle it would probably render a brilliant account of itself against any navy in existence.

I asked the captain of a Japanese steamer how many boats Japan could take over in case of war for transporting her troops to the theater of action. He gave me the following table:

Tons.	Number of ships.	Troops per ship.
1,000—2,000	119	700
2,000—3,000	100	900
3,000—4,000	63	1,200
4,000—5,000	26	1,600
5,000—6,000	6	2,000
6,000—7,000	25	2,000
7,000—8,000	1	2,000
8,000—9,000	6	2,300
9,000—10,000	1	2,500
10,000—15,000	3	3,000

If Japan is fully abreast of the age in the arts of war, she has also developed the fine arts in a way that has called forth the admiration of the world.

Japanese art is founded on the same canons as that of the Greek, namely, the elegance of simplicity. Indeed, it has been claimed that the only difference between the two is that the Greeks glorified the nude. Perhaps the critics won't agree to this, but the only two architectural creations that seem perfect to me are the Greek column and the Japanese arch or "torii," which one sees before every Shinto shrine. Nothing can be added to either of these paragons or subtracted from them without destroying their perfection.

Professor Chamberlain has thus characterized the difference between Japanese and Western art:

"The Japanese are undoubtedly Raphaels of fishes and insects and flowers and bamboo stems swinging in the breeze; and they have given us charming fragments of idealized scenery. But they have never succeeded in adequately transferring to canvas the human form divine, they have never made great historical scenes live again before posterity and they have never, like the early Italian masters,

drawn away men's hearts from earth to heaven in an ecstasy of adoration."

The essence of Japanese art is loyalty to nature. The artist avoids geometrical artifices. He will not divide, for instance, a lacquer box in the form of a parallelogram into equal parts by a perpendicular line, but by a diagonal. He will distract the eye from the regularity of a circular box by a zigzag breaking the outline with appropriate ornaments.

Nothing fascinated me so much in Japan as the gardens. Every Japanese home has one, even if it is only six feet square. The theory of a Japanese garden is artificial naturalness. Every tree and shrub, stone and brook is artificial, but made to look natural. When standing in the center of the garden one seems to be in a world all alone, for the sky line is so arranged that all neighboring gardens and buildings are hidden behind trees. If there is a distant mountain on the horizon, it is brought into the landscape, while the intervening objects are obscured. There is a philosophy of the arrangement of stones that has been worked out to a perfection of nicety. A New Hampshire farmer could make a fortune if he could get some of his granite boulders to Japan. As it is, they are frequently imported from China and Korea at fabulous prices. The Japanese cannot go anywhere without improving on nature. Even a mud puddle by the roadside is quickly surrounded by pretty stones and moss, and a gold fish put in.

The large Japanese sculptures, while showing a marvelous technique, seemed grotesque to me. Most of the animals and men, whether of stone, bronze or wood, have demoniac rather than angelic expressions. A few of the Buddhas, however, notably the famous Dai Butsu of Kamakura, exhibit countenances betokening the beauty of holiness.

Japanese singing is rather incomprehensible to an American. We were privileged to see and hear some of the best of the celebrated "No" dances and Geisha dances, where the native music, both vocal and instrumental, is at its best. In the "No" dances the parts are all taken by men; in the Geisha dances, of course, by women. Here again the Japanese resemble the Greeks. The "No" dances especially are like the

Greek tragedies. A chorus explains to the audience the emotions of the actors as the latter go thru their recitatives and solemn motions. Even the Geisha dancing is formal, tho graceful, and is confined chiefly to posture. The singing and playing, however, seem primitive to us. Dr. Scherer, now president of Throop Polytechnic Institute, California, thus describes a classical concert:

"The musicians sat around on the floor of the stage, while the audience waited in reverential silence. Presently the silence was broken by a wild welter of sound that soon drove me, in the effort to retain my dignity, almost to the point of distraction. To make matters worse each of the solemn performers would occasionally open his or her mouth and emit a most astonishing howl, compounded of profound canine sorrow and the nasal honk of a wild goose."

Don Seitz, in his recent volume on Japan, says:

"Japanese music is querulous and plaintive, lacking sonorousness and threnody. It belongs to the tum-tum and plunk-plunk class

without the stirring jar of the banjo, or the rhythm of the mandolin or guitar."

Perhaps Miss Bacon is right, therefore, when she observes, in "Japanese Girls and Women": "It seems to me quite fortunate that the musical art is not more generally practised." But people who live in glass houses should pull down the blinds. The Japanese told me they could make nothing of our music. I must make one exception, at least, to my feelings in regard to Japanese music. I cannot praise too highly their noble national anthem, "Kimi ga yo." This is played very slowly and is most impressive when sung in unison by the people. It is the only national anthem in the world, I believe, that does not "confound enemies" or attack other nations. Freely translated, it is as follows: "May the years of the Imperial line be ten thousand times ten thousand, until the pebbles grow into boulders, and the boulders are covered with moss."

NEW YORK CITY.

April's Return

From the Japanese

BY HENRY B. TIERNEY

ON the tender, fragrant blossoms
Falls the vagrant crystal snow;
Like a faery velvet mantle
Covering buds and flowers below.
When I sought (how vain) to carry
Snowy treasures of the land
To my loved one in the city,
Lo! They melted in my hand.

Chaste the white snow in the garden,
Fleecy locks of dying year,
Bright the sun in vernal glory,
Twines each crystal to a tear:
And it seems as if old Winter,
Conscious of his dying hour,
Weeps in solitary anguish,
Leaves a tear-drop on each flower.

Bright arrayed in tender colors
Blossoms raise their lovely heads;
And the flowers, thrilled with rapture,
Tremble in their soft green beds.
Far beyond—among the hilltops,
Sleeps e'en now the peaceful snow;

Full of birds the weeping willow,
Near the river, far below.

O thou stream-consoling willow,
Soon with light and welcome wing,
Nightingale among the branches,
Sweet will live, entrancing sing.
Now the fragrant cherry blossoms
'Gin to tremble, fade and fall;
What a shame so soon to slumber,
Blossoms dear to lovers all.

Gently fall, spring rain, fall gently;
Scatter not the cherry flowers,
Till I've loved their beauty longer,—
For a day withhold thy showers.
April, shame, thou month of showers,
Linger in thy sky of blue;
Moderate thy ardent torrents,—
Art thou jealous of the dew?

Long I strolled, this April morning,
Thru the woodland's aisles of green:
Now returned the joy birds' carols,
Welcome, Spring, thou blushing queen.

TRENTON, MO.

Has Compulsory Arbitration Failed?

BY EDWARD TREGEAR

EX-SECRETARY OF LABOR FOR NEW ZEALAND.

SADNESS will fall upon some of us here in New Zealand if we are forced to accept the doleful views expressed by some recent writers in America as to the utter failure of compulsory arbitration in a country whose chief claim to notice from students of political economy appears to be the success or failure of this one bold industrial experiment.

Has compulsory arbitration failed? I certainly will not admit such failure till the principle is assuredly acknowledged generally to be "down and out." Let me briefly summarize the accusations which, if substantiated, imply failure: (1) The Arbitration Act was intended to prohibit strikes, yet strikes have taken place. (2) The act is unjust, because you can enforce it on employers but not on workers, since the latter cannot be compelled to work, nor to pay fines, nor can they be sent to prison in any number. (3) The strong unions are withdrawing from under the act, and, altho the Arbitration Court still sits, it is only as a mockery and to "save the face" of the act's supporters.

I will try to answer these challenges, each in turn. (1) That the act was intended to prohibit strikes. I do not believe that any men in full possession of their senses would pass a law pretending to prohibit murder if by "prohibition" is meant the absolute stoppage or cessation of murder. No law making can absolutely prevent murder; it can only punish for breach of prohibition; no law can stop men from striking or ceasing to work; it can only punish those who violate the law, and that, of course, after the law has been broken. The New Zealand Industrial Arbitration Act did not attempt the impossibility of preventing men from striking; what it tried to do was to foster conditions which would make striking unnecessary and foolish, and also cause discomfort to those who, having made an agreement not to strike,

still persisted in doing so. When an industrial union registers itself under the Arbitration Act, it virtually renounces its power of striking in favor of the benefits of arbitration, and what our law attempts to punish is, not the act of striking, but the breach of the social contract.

(2) As to the unjust incidence on employer and employee, it is true that in a few cases it has been found difficult to collect fines from strikers or to imprison those who refuse to pay the fines. In by far the majority of cases, however, the fines have been collected, but it is not easy in any new country, where the population is to some extent shifting and unfixt, to pursue a wandering worker unless he is regarded as a criminal and tracked with police assistance. It may be theoretically unjust that an employer's property should prove a better mark for distraint than the chattels (if any) of a poor man, but this is a weakness found in civil cases brought under any statute; it is always easier to make a rich man pay when he loses than "the man of straw"—at all events, that is the case in New Zealand.

(3) The third indictment is partially, but only partially, true. Some of the strong unions, especially coal miners' unions, have withdrawn from under the act, so as to get liberty to strike if they will—that is, they are no longer parties to the contract of arbitration—but to say that the act is regarded as a mockery or a farce in this Dominion is a judgment that in my opinion will not bear examination.

What are the facts generally concerning compulsory arbitration? We have had it in operation about seventeen years, and during that time have lived in what may be considered a state of industrial peace. When I say "we" I mean the great majority of citizens, the general public. The half dozen so-called "strikes" during that period would be laughed to scorn in any other country.

They have been little trivial affairs, confined strictly to localities, and involving no disturbance or inconvenience to other trades, or to their branches of the same trade elsewhere. They have been settled quietly, and the main body of the strikers in every case punished, altho perhaps a few individuals have slipped thru the meshes of the legal net. What is there to put on the other side of the account against these microscopic disturbances? First, immense general prosperity, largely caused by the stability of trade conditions. The employers have benefited so greatly by the industrial equilibrium that their establishments in regard to values of land, plant, production, and the employment of workers have more than trebled since the act came into force seventeen years ago. The employers are now the supporters of the act they at first feared and reviled, and strange to say (thru the workers' ingrained belief that, under the wage system, industrialism is war), much of the workers' expressed suspicion of the act arises from the warm favor in which it is held by employers. Next, the workers must have benefited to the extent of hundreds of thousands—if not millions—of pounds by the action of awards fixing minimum wages. Let me give an example. Some ten years ago hundreds of girls were working in this city as waitresses at confectioners, tea-rooms, restaurants, etc., for wages sometimes as low as \$2.50 for a week of ninety hours. An industrial union was formed by the girls, an award obtained, and there is now a minimum wage of \$6.25 for a fifty-two hour week. There is thus a margin of thousands of dollars every week between the old "freedom of contract" wages and present wages. Multiply these thousands of dollars for hundreds of localities and hundreds of weeks and you will find the amount considerable for this one trade alone. Then consider similar "weak" trades (that is, where their members are easily replaced), trades in which by sex or occupation strikes are almost out of the question, and any one can see that the act has been of immense value, even financially, to the workers; especially when, in strong unions as in weak, the prosperity of general business has induced working full time for year after

year instead of the old frequently broken periods. It is true that the coal miners have withdrawn many of their unions from under the act, but their action needs further explanation than to refer their conduct wholly to the act or its shortcomings.

Lately there has been formed here an organization called "The New Zealand Federation of Labor." It declares craft unionism to be a failure, and preaches the submergence of craft unions in one great union which can, if necessary, bring about a universal strike. The miners have joined this society, and to be ready for emergencies have withdrawn their unions from under the Arbitration Act, but they have not struck, nor will they probably strike until the time is ripe. This new departure does not prove in any way the error of principle in industrial arbitration; it only shows that they believe they have found a more valuable and effective weapon with which to wage the fight. The great majority of unionists still trust in argument as being better than display of force, and this is proved by the continually augmented numbers which each year sees registered under the act, in spite of the withdrawals to join the Federation of Labor. The industrial unrest, now pervading all classes of workers everywhere, would, I believe, have had the effect of uniting the more unquiet spirits in some similar organization whether the Arbitration Act be more valuable or less valuable than it is.

Here we have tens of thousands of workers quietly engaged in their occupations month after month, apparently content with compulsory arbitration. They are not quite satisfied, for the modern "divine discontent" would prevent that under what I think (as they think) an unfair and immoral economic system by which few workers are allowed to be employed—that is, to live—unless they can make profit for others than themselves. Putting that view aside, human weakness in the administration as well as in the observance of the act has caused friction and grumbling, but to say that the court is regarded as a farce appears to be a totally inadequate presentment of the situation. Why should we worry ourselves about the punishment of strikers when practically we are still "a land

without strikes"? Why push things to unnecessary conclusions and worry while eating your dinner as to what will happen if you eat to repletion? We shall probably have strikes, severe strikes, before long, but they will not have their place of primary origin in these islands or in the failure of the Arbitration Act. They will arise because of a great object lesson given recently in London and Liverpool as to the power of organized labor to get almost anything it chose to demand if it would only carry on the nec-

essary functions of production or transport, and not cut off national supplies. This movement will trouble you as it will trouble us; and it will make you, who have no compulsory arbitration, feel your social edifice shake, as we, who have the principle working, will feel the tremors of the economic earthquake. Our humble buildings will be comparatively safe, but one day there will be crashings among the "skyscrapers" of the world's great cities.

WELLINGTON, NEW ZEALAND.

The Needs of New York Harbor

BY STEVEN B. AYRES

MEMBER OF CONGRESS FROM THE STATE OF NEW YORK.

THE amount of business done by the citizens of the United States with the citizens of foreign lands has been growing rapidly of late years. The value of the imports into and exports from this country, which combined make up its foreign business, has at five-year periods been as follows:

1896	\$1,668,410,000
1901	2,318,499,000
1906	3,163,218,000
1911	3,591,480,000

It takes many ships to carry merchandise of that value, and the owners of the ships have found that by building bigger ones and carrying bigger loads, the work can be done cheaper. So ships have constantly been growing larger. Now, when a ship is made larger, it also usually sinks deeper into the water, or, in other words, its draft is greater. Twenty years ago scarcely any vessel in use drew more than 25 feet of water. But last year there came into the port of New York big merchant ships as follows:

783 with draft from 27 feet to 30 feet.
196 with draft from 30 feet to 33 feet.
42 with draft from 34 feet to 37 feet.

Battleships are also much larger than they were even ten years ago. The "Oregon," of patriotic memory, was rated at 10,288 tons and its draft was 24

feet. But the last two ships of our navy, the "Utah" and the "Florida," are rated at more than 23,000 tons and the maximum draft is 29 feet 8 inches. Other battleships, even more powerful and with greater draft than these, are now talked of as possibilities.

A glance at the map of the water surface surrounding New York will show how Nature has adapted it to be one of the finest harbors in the world. There are long shore lines on both the Hudson (North) River and the East River. There are two principal entrances from the ocean, by way of Sandy Hook and Long Island Sound, and one minor entrance thru the Staten Island Kills. All these entrances are easily defensible. The harbor is large enough, too, to hold at one time nearly all the navies of the world. Tremendous natural advantages these. Is it any wonder that New York has grown to be the second city of the world in little more than three centuries?

For commerce goes where it is given the best service, where the ships that bring merchandise can be moored directly against the wharves, where the cargo can thus be discharged cheaply, and where are waiting railroads to convey to the many interior towns such articles as are destined for them. In the past all these facilities have been present in New

York harbor, and so the city has handled about three-quarters of the foreign commerce of the United States.

But with ships increasing in size and of greater draft, there is another side to this picture. Look now at the other map, which shows in shaded lines that part of this magnificent harbor surface where the water has a depth of less than 30 feet. Along the west shore of Manhattan down to the Battery, and in one or two short stretches on the Jersey shore of the Hudson River, and for a short distance on the Brooklyn front, these big modern ships can land their cargoes; but nowhere else. On neither the Manhattan nor the Brooklyn side of the East River, above the bridge, can these big boats be docked. And, moreover, they cannot get thru the East River into Long Island Sound. In other words, two-thirds of the harbor frontage is at present not adapted to the most economical uses of navigation.

The piers which have easy access by surface railways and deep water are all in use. And there can be no more until the shoals are removed. Is it surprising, then, that rumors are heard of transatlantic lines seeking terminals at other cities, and that New York is not quite holding its percentage of the gain in traffic?

This, then, is the problem that the Greater City must solve. A channel at least 900 feet wide and at least 35 feet in depth must be cut in the East River, from the Battery to the Sound; and a depth of at least 30 feet must be secured from this channel to the piers on both sides of the river, in order that economical use may be had of the harbor front-

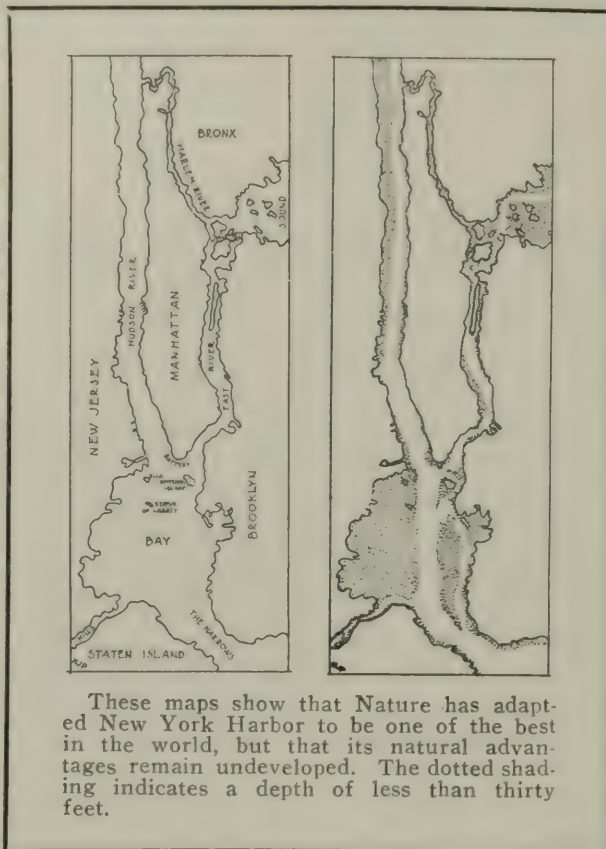

age. Now, this is easy to say and hard to do. Many problems of engineering must be met and conquered. Because not only must there be sufficient depth of water, but the tidal currents must be overcome. The East River tides have long been the despair of seafaring folk. They are very different from the tides in the Hudson, on the other side of Manhattan. There the water flows in and flows out again. But in the East

River are at least two tides, and the point of high water is not the same with one as with the other.

In order that this may be clearly understood, let us assume that the period of low water, mean low tide, is the same at Sandy Hook and at Montauk Point, at the eastern end of Long Island. When the tide begins to rise, it flows toward Hell Gate, in the East River, from two directions. It flows up from Sandy Hook and it flows westward in the Sound. But it is

a greater distance from Montauk Point than from Sandy Hook, and thus the times of high water are different in these two tides. And this is complicated still further by the water flowing into and out of the East River thru the Harlem River, which receives a swift tide from the Hudson, these waters from the Harlem being discharged into the East River thru narrow and rocky channels known as the Harlem Kills and Little Hell Gate.

The result of it all is that at times in each day the currents are racing thru the crooked channels of the upper East River at a rate of about 12 miles an hour, so that there are periods when even shallow barges cannot be towed at all. Yet, notwithstanding these disad-

vantages, the total amount of traffic on the East River during the year 1911 is computed to have been 45,000,000 tons. How this amount would grow if the largest vessels could only use the river.

Thus, besides giving great additional room for deep-water wharves, the widening and deepening of the East River and its connecting channels will accomplish three very important purposes:

1. The tidal currents will be reduced in velocity to about six miles an hour, just about one-half what they are now at their worst. This will avoid many accidents and make navigation possible both day and night.

2. Large passenger and freight ships going easterly can use the inside route thru the Sound instead of being forced to take the outside course along the southern shore of Long Island, which has been in the past the scene of many disasters.

3. In a time of possible war, if New York harbor were blockaded by a superior naval force, our fleet defending the city would have two routes to the open sea, and such of our war vessels as were striving to enter the harbor would find it twice as easy. A hostile fleet, closing the harbor, would then need just twice as many vessels to maintain an efficient blockade.

All tidal waters of the United States are under the control of the Federal Government, the supervision being in the War Department. As long ago as in 1907 the Congress recognized the fact that something must be done with New York harbor to keep it abreast with modern requirements. In the River and Harbor bill of that year money was appropriated for a thoro survey of the East River, and the engineers of the army were directed to make a report as

to plans for improvement. This work has been done, and the report of the engineer in charge, Col. William M. Black, has been sent to Washington. It is now being considered by the River and Harbor Board of Engineers, men of great experience, who will review the suggestions and finally recommend to the Congress the proper course to pursue. Until their decision is made public it will scarcely be wise to quote from Colonel Black's report, farther than to say that he suggests the improvements described above as necessary, and makes some estimate of the cost, which is approximately \$30,000,000.

This seems a large sum, but it is a wise expenditure if it will accomplish the purpose sought. In the race for the commerce of the world we must have every advantage or we will be distanced by our active rivals, Great Britain and Germany. They have spent on their harbors much greater amounts than this.

Soon the Panama Canal will be opened for the ships of the world. It will greatly stimulate our foreign exchanges. Already our shipbuilders are encouraged with orders for vessels to be used in the South American trade. And as this trade grows, as grow it must under pressure of the necessity for more markets for our manufactures, other and larger ships will be built. A line of steamers must be established between New York and the ports of Eastern South America, Rio and the River Plate. At present capital from the United States is building a railway system in Uruguay. Our manufacturers are slowly learning to adapt their productions to the wants of the nations with whom we deal, and when this lesson has been thoroughly learned, American ingenuity will make us yet more feared by our great competitors.

WASHINGTON, D. C.

The Negro in the Chicago Primary

BY GEORGE W. ELLIS

ON April 9, 1912, a State-wide primary was held in Illinois for the nomination of candidates of the different political parties for the various offices of the counties and the State. The contest just closed in Illinois is, perhaps, the most important in recent years. Both of the great political parties of the State for some time have been divided and torn asunder by warring factions; and it was frequently asserted during the campaign that the paramount issue was to free Illinois from the domination of crooked big business in alliance with crooked political bosses. Before the primaries there was such widespread confusion and uncertainty that, outside of political managers, only a few posted political leaders ventured to predict what the ultimate outcome would be.

Governor Charles S. Deneen clarified the situation very much by wisely calling an extraordinary session of the Legislature to pass a bill authorizing a State-wide Presidential preference primary vote, and the people of the State showed their appreciation of this official act as well as his eminent public services by renominating him to a third term by a large plurality over Mr. Len Small, the Lorimer candidate, who was second of the eight Republican candidates for Governor. The Republican situation was placed beyond doubt, however, when Colonel Roosevelt entered the State and championed with unfaltering courage the right of the people to rule and of the absolute necessity to restore decency in Illinois politics.

Among the many lessons afforded by the Illinois primary there are, perhaps, none more significant and important than the one given to the Negro citizens. There were a number of prominent Negroes running for the nomination on the Republican ticket for different offices. A number of colored men were aspiring for the same nomination, and it was felt by many voters, both white and colored, that because of this fact the Negro citizens would likely lose proper represen-

tation on the Republican ticket. One faction in the party openly express the fear that the white people would not do justice to the Negro, and politicians generally confess their regret that the old nominating convention had been abolished and with it most of the opportunities of the colored citizen, thru the Republican boss, to secure just recognition at the hands of the Republican party.

In the light of these considerations it is of interest to the citizens generally and the Negro in particular to study the results of the Chicago primary, where all these fears and questions have been submitted to the actual test of experiment and decision. The total Republican vote on President in Chicago and Cook County is 149,041; 85,159 for Colonel Roosevelt, 49,897 for President Taft, and 13,985 for Senator La Follette.

In the First Representative District there were six candidates for the Illinois Legislature, four colored and two white. There were two to be nominated. The vote was as follows:

Maurice J. Clark (white)	3,639
Edward D. Green (colored)	3,519
Henry S. Goins (colored)	1,937
Frank C. Leland (colored)	778
Robert D. Ruffin (colored)	448
Shirley T. Hich (white)	733

The two candidates nominated were Mr. Clark and Mr. Green, one white and one colored. The people were neither prejudiced nor confused by the number of colored men running, and the white voters joined with the colored and selected one of each as the Republican nominees for representatives of the First Representative District. Mr. Green is the author of very important legislation affecting the rights and safety of colored citizens in Illinois, and it has proved to be of value to white citizens as well. This successful candidate received only 417 votes less than the combined vote of all the unsuccessful candidates.

In the Third Representative District there were six Republican candidates for the nomination to the Legislature, one

colored and five whites. There were only two to be nominated. The colored candidate led all the others. The vote was as follows:

Jackson (colored)	5,901
Ostrom (white)	4,010
Van Hatten (white)	2,488
Kelley (white)	2,128
Best (white)	1,937
Marshall (white)	1,177

Major R. R. Jackson, the colored nominee, is an important officer in the Eighth Regiment and has a splendid record as a successful private citizen. His ability and achievements were so highly appreciated by all the people of his district that he received 1,351 more votes than the leading white successful candidate.

In the contest for Cook County Commissioners there were forty-six candidates and only ten to be nominated. There were forty-two white candidates and four colored. The Republican voters of the county decisively nominated nine white and one colored. The vote of the leading white candidate was 72,034, and the vote of the lowest successful white candidate was 40,568, or 1,048 votes less than the successful colored nominee, whose vote was 41,616. The highest colored candidate was ninth in the contest; the second colored candidate twenty-second, the third twenty-fourth, and the fourth twenty-seventh. And the vote of the lowest colored candidate was 9,857, a larger vote than nineteen white men, and 6,485 more votes than the lowest white candidate in the contest.

The successful candidate, Mr. Louis Seldon, is a splendid young colored man, and had the support of the regular Republican organization of Governor Deneen. Mr. James N. Simms, ranking second among the colored contestants, was an independent candidate. Rev. Jordan Chavis, ranking third, was supported by the Lincoln League, repre-

senting the Senator Lorimer faction. And Mr. B. F. Moseley, a prominent colored attorney, was identified with the Progressive movement. And yet, in spite of the multiplicity of white and colored candidates and all the party and factional issues involved in the campaign, the average white and black man quietly went to the polls and selected one black man and placed him on the ticket with nine whites for the high office as members of the Board of County Commissioners of Cook County, which has charge and control of all the public institutions of this great county.

And thus, in one of the greatest primary battles ever held in Illinois, the people of Chicago and Cook County, amid the great confusion of numerous candidates and party factions, gave to the colored citizens of Chicago a nominee as a Republican member of the Legislature in two representative districts, and a member of the most important board in Chicago and Cook County.

The fear that in the Illinois primaries the rights and political opportunities of colored citizens would be jeopardized by the rule of the people has been emphatically proven groundless. The longing for the dominion of the old Republican bosses among colored people has been given a fatal blow in Illinois. The faith of colored citizens in the justice and fairness of the plain white people has been considerably strengthened and increased here. And from the inspiration thus received there will rise up in the future, from among the colored people, not leaders who seek only offices for themselves, but real representatives of the race, who with the white representatives will toil and labor with those larger social and political problems which shall make for the peace, happiness and general progress of all the people, without regard to race, condition or color.

CHICAGO, ILL.

Rose's Life of Pitt

MR. ROSE's earlier volume—"Pitt and the National Revival"—carried Pitt's career to 1791. His second volume* takes up the narrative in 1791 and ends with the death of Pitt in 1806. This volume easily falls into three main sections—the beginning of the Radical movement and Pitt's attitude toward it in and out of Parliament; the war with France that began in 1793, and was still going on when Pitt died; and the union of Ireland with Great Britain. Mr. Rose gives an adequate presentation of social and industrial conditions in England at this time—of the popular discontent and the miserable social conditions out of which the Radical movement in the large centers of population grew. But he is usually careful not to let his sympathy with the Radicals run away with him; for the Radicals lacked admiration for Pitt and his policies toward France, also for much of Pitt's domestic policy; and Mr. Rose's key is always that of patriotism.

For the common people of England, of whom admittedly Pitt had no first-hand knowledge, there surely never was a period when life was less worth living than in the period from 1791 to 1806 and the thirty years that followed. The conditions of those days were not favorable to the development of patriotism among the classes from which men were pressed for the navy; and it is overplaying the patriotic note for a student with Mr. Rose's intimate knowledge of social England of that day, and of actual conditions in the navy, to deplore the lack of patriotism there. But the mutiny at the Nore and at Spithead in 1797 added to Pitt's burdens; and while Mr. Rose concedes that the mutiny ought to have been averted by timely concession to the sailors, he has usually scant sympathy for people who did not see eye to eye with Pitt and support him in all his undertakings.

The opposition of the Whigs to Pitt's measures is described as the mewling of faction and the opposition as a carping minority. When Francis Place came on the scene in 1795, he is, according to Mr. Rose, either a consequential tailor or "a rabid tailor of Holborn," a less than fair description of a man who accomplished more for the English working classes than did Pitt in the whole of his Parliamentary career.

It may be questioned if there was ever a more searching picture of the royalties of England and of Continental Europe in the early years of the coalition against revolutionary France than that drawn by Mr. Rose:

"Catherine of Russia was supremely able, but no less corrupt. Frederick William of Prussia equalled her in vice and in nothing else. Francis of Austria had the brain of a master of ceremonies, George III that of a model squire, Ferdinand of Naples was in his place in the kennel, Victor Amadeus of Sardinia in the confessional. It is difficult to say to what place Charles IV of Spain and his consort can be most fitly consigned, for they could not live apart from Godoy, and with Godoy they would have been excluded from any residence but the royal palace of Spain."

All these Continental royalties in the war with France were eager either for territory or for British subsidies. It is proof of Pitt's greatness and courage that he set to work with such material, and proof of his patriotism that he did not abandon the undertaking to which in 1793 he had committed himself when he found how little reliance could be placed on the sovereigns whom Mr. Rose thus depicts.

One incidental value of Mr. Rose's volumes is that they show how far government by cabinet, even up to the end of Pitt's career, fell short of government by cabinet as it has been recognized and accepted in England since the early days of Queen Victoria. Some steps were taken during Pitt's premiership toward the cabinet as it exists today, notably when Pitt insisted on the expulsion of Thurlow, and thereafter made the will of the premier supreme in the cabinet—a supremacy that in later days has never been

*WILLIAM PITT AND THE GREAT WAR. By J. Holland Rose, *Litt.D.* New York: The Macmillan Company. Pp. xiv, 598. \$6.

questioned. But as long as George III was able to impose his will on Prime Ministers as he did on Pitt on the questions of Parliamentary reform and Catholic emancipation, the progress of the cabinet toward the institution that we know today was necessarily slow, and Prime Ministers could not have a free hand. George III defeated Pitt's reform bill of 1785 in the cabinet. Its submission to the House of Commons was a sham. Mr. Rose concedes that this was the chief crisis in Pitt's early career, and that out of it grew the failure of his bill for the abolition of the slave trade; and that, moreover, after Pitt had thus in 1785 been thwarted by George III he was compelled to the end of his career to govern mainly as the King's minister and not as the minister of the people. Looked at from any point of view Pitt's career was one of greater difficulty than that of any premier since his time; but while these difficulties hampered Pitt enormously and stood in the way of his complete success as a statesman, especially as regards his domestic policies, today they enhance interest in his career, and give an abiding value to the labor that Mr. Rose has so lavishly bestowed on the production of a great biography of Pitt.

Dr. Saleeby on Woman

It is doubtful whether the leaders of the Woman's Movement will feel as grateful as they might be expected to feel to Dr. Saleeby for his contribution to their stock of ammunition. *Woman and Womanhood** is a tremendous arraignment of man's stupidity and ineptness as shown by his past efforts to build woman into the image he had formed for her. No one has shown more clearly than Dr. Saleeby here sets forth the utter failure of man's attempt to define woman and to educate her for her place in life. No one has asserted more strongly the psychological impossibility of man's so entering into woman's nature and mentality as to understand her point of view and to be able to bestow upon her the right kind of training and preparation for the sphere which should be hers. He summarizes recent scien-

tific knowledge concerning the determination of sex by saying:

"In man nothing but maleness. . . . He may fail to become a man and may remain a boy, or having been a man he may perhaps return under certain conditions to a more youthful state; but he will never, can never, display anything characteristic of the woman. The female is not female all thru, as the male is male all thru. So far as sex is concerned, he is made of maleness plus maleness; but she is made of femaleness plus maleness."

After thus laying the scientific basis for an understanding of the two sexes, it might have occurred to Dr. Saleeby that it was a little unbecoming for a man to take upon himself to dogmatize concerning the instincts and sphere of women without taking counsel with them upon the matter. Again and again he indignantly comments upon the misguidedness of the women who venture to suggest that legislation concerning women and the crystallization of new plans for their treatment in their relations to husband, children, work and society would be better postponed until women themselves had been consulted.

Dr. Saleeby believes in Votes for Women. He asserts his belief repeatedly and emphatically. But with all these assertions of belief, it is plain that he does not in the least understand the intensity of the demand for enfranchisement. The vote seems to him but a small matter, and he openly prefers what he calls "good legislation" for the protection of women, passed by a Parliament in which women are unrepresented, to the liberation of women from their status of political inferiority and their establishment in a position where they would be able to work out their own salvation.

The feeling of resentment that Dr. Saleeby arouses in the minds of thoughtful women who share his opinions in regard to the mistakes of past education is strengthened by the lack of balance shown in his schemes for the future. Dr. Saleeby describes the terrible pressure on women and girls due to low wages and the precarious conditions of motherhood. And yet his whole scheme of education is aimed at training and strengthening the maternal instinct—an instinct already strong and imperious in almost every woman, while its satisfaction is denied to vast numbers of them

*WOMAN AND WOMANHOOD. A SEARCH FOR PRINCIPLES. By C. H. Saleeby. New York: Mitchell Kennerley. Pp. 398. \$2.50.

by the conditions of modern civilization and the consequences of the vices of men. As a piece of sarcasm, one might almost think, Dr. Saleeby adds a chapter on the choice of a husband; altho, in discussing the disparity of the sexes, he states that the preponderance of women in England places the choice almost entirely with the men, who are, he asserts, very much less capable of exercising it wisely than the women. The result of carrying out the training recommended by Dr. Saleeby under present economic conditions would be, on the one hand, women trained for motherhood with the maternal instinct quickened and strengthened by every means that men could devise to that end, with no assurance that they would ever be mothers, tho unfitted for any other part in life. On the other hand, the men with whom the choice lies would prefer the showy and frivolous women who know how to catch their fancy, and yet who would make no better mothers than the average untrained woman of the present time. Surely, on his own showing, Dr. Saleeby had better devote himself to the education of boys, and advocate proper training for future fathers.

Another point on which most women will disagree with Dr. Saleeby is his calm assumption that the average married woman, the mother of a family, is parasitic on her husband. Dr. Saleeby upholds that it is the duty of men to support women, and that women, on account of their service to the community as mothers, deserve support. The theory may or may not be tenable. The fact is that very few women are supported by their husbands. In the vast majority of homes, the man and woman work together to support the family, and the economic value of the woman's contribution is usually fairly equal to the value of the man's. Even in money value, the contribution of the woman who takes care of the home, spends the income, cleans, washes, cooks and sews for husband and children is not inconsiderable.

If this be taken as a basis, it will be seen that in a very large proportion of the homes the wages of the husband would not suffice to pay for the services rendered by the wife. In these cases it

is obvious that the wife is not parasitic on the husband; but is supporting the husband rather more than the husband is supporting her. The cases are few indeed where the wife contributes nothing at all beyond her bare service in bearing and nursing the children.

With so much that is suggestive and helpful in Dr. Saleeby's book, with his splendid advocacy of the equality of the sexes and of equal obligation in regard to purity and parentage, Dr. Saleeby has not attained to the grace of humanity sufficiently to see that the woman question can never be satisfactorily settled by men alone, and that the woman built up in the image of man will never constitute a satisfactory solution of the much-discussed woman question.

Of Architecture

M. BENOIT'S *Architecture*¹ is one volume of a series of manuals of the history of art, which include painting, engraving, embroidery and architecture from the Middle Ages, doubtless to be followed by other volumes. They are of a class in which the French excel, giving the untechnical reader a trustworthy and clear bird's-eye view of a subject, richly illustrated for the eye. The subject of this volume is a very large one, and might fill a dozen volumes as large as the present one, but they would be for the specialist, and find no market. The term "Antiquity" in the title covers the whole Old World, the Neolithic period, the Egyptian, Mesopotamian, Hittite, Syrian, including Palestinian, Phenician and Cypriote, the primitive Aegean, Cretan and Mycenaean, the Achemenian and the later eclectic Roman. Under each head the author treats of the topographical conditions of art, physical or human, the purposes, whether for dwellings, temples or tombs, the construction and the artistic effect, whether in form or ornament. The whole gives a broad and admirable survey of the styles and types of ancient architecture. But the reader must not look for the history of the development of the art of building during the centuries or chiliads during

¹L'ARCHITECTURE: ANTIQUITÉ. Par François Benoit. Ouvrage illustré de 148 Gravures, de 13 Cartes et de 997 Dessins schématiques par l'auteur. 8vo, pp. vii, 575. Paris: Librairie Renouard. 15 francs.

which the several ancient empires flourished. We have, rather, the account of the styles of architecture at its best period. Thus in the chapters on Mesopotamian art, attention is given almost entirely to the later Assyrian period, while the earlier Babylonian period has scant attention, perhaps excused by the less abundant material for study. And yet it would not have been amiss to have included gates and doorways often figured, nor the shrine of the sun-god of Sippara, with its Ionic column. In spite of Delacouperie, we hesitate to accept as proved the statement (p. 120) that Mesopotamian architecture influenced that of China; and we fail to see evidence that the number seven was an element in the ancient structures. The author says that the old ziggurats were of seven stories, but the oldest figure of them we have, that of the boundary stone discovered by Loftus at Susa, has but four. In the study of construction the author is especially good, and one is pleased in the first chapters to see drawings to show how the neolithic menhirs and cromlechs were set up.

Mr. Lethahy's little volume² begins with a full chapter given to Egyptian architecture, showing the beginnings even in the four first dynasties of architecture and its elements and development. We observe that he inclines to the later Berlin chronology, which puts the beginning of the First Dynasty at about 3300 B. C., and we are accordingly surprised that he does not, in the succeeding chapter on Babylonia and Crete, know that scholars at present take off a thousand years from the date of 3800 B. C. for the Elder Sargon. The early origins of Greek architecture are well given, but not the relation to the Hittite. Then follow the Hellenistic, Byzantine, Norman and various Gothic styles to the Renaissance period, usefully illustrated occasionally by elements and *schemata*. A great merit of the book is the care with which national construction is traced back to primitive forms, such as a reed hut or a palm tree column. This manual is to be much commended.

Tennyson and His Friends. Edited by Hallam Lord Tennyson. New York: Macmillan & Co. \$3.

Those who love Tennyson—and who does not?—will love his friends; that is, the sort of friends whom his son brings to the fore in this last of the old groupings. The book work is admirably done; the drawings in black and white and the protogravure give us fine heads of Tennyson and his brothers, of Arthur Hallam and Edward Lushington, and various views of the Tennyson homes. Among the pen pictures also we have, in "letters," "records," "memories," "criticism," the lines that indicate the great poet's likings, his depth of heart, his breadth of thought, and his limitations as well. These nearest of friends were strong men, and they are arranged ingeniously, by the editor, so as to make clear to the onlooker how a lofty mountain with a white peak may out-range its neighbors without altogether eliminating their claims to individuality of their own. Of these choice spirits, Spedding contributes a joyous wit and the delight of a pleasing style best; FitzGerald, some interesting table talk, which may well illustrate the FitzGerald facet of Tennyson's mind. In all the contributions we have the contributory interest well accented. Tennyson is the recipient of favors; the others the givers in the verbal exchange. In his letters, as here printed, Tennyson is not always a user of golden words. Yet his words seem to have been carried to a hungry market. It is perhaps regrettable that the poet's moods were not often favorable to such ideals as we have in America, nor to the American personality. Yet one might reasonably expect that here and there an American might have been found of sufficient dearness and nearness to the poetical heart to have his name set largely in the group of "Tennyson and His Friends." Here and there one is alluded to—Taylor, Lowell and a very few others. It leaves the American reader impressed with the feeling that the great poet's habits were essentially insular; that, unlike Carlyle and Darwin, he could not feel across the water, or in any respect outside the liminary waves that bound the little but powerful group of British isles.

²ARCHITECTURE. An Introduction to the History and Theory of the Art of Building. By W. R. Lethahy. 16mo. pp. 256. New York: Henry Holt & Co. Fifty cents.

American Political Ideas. By John Fiske. With an Introduction by John Spencer Clark. Boston: Houghton Mifflin Co. \$1.50.

This very remarkable series of addresses—three in number—delivered in 1880 before the Royal Institution of Great Britain, is introduced in a carefully studied essay by John S. Clark, who gives an admirable analysis of Professor Fiske's lucid style of historical composition and a foretaste of the biography of the historian and essayist which seems to be promised for the near future. Six lectures had preceded the three, and Dr. Fiske, in some racy letters written in that intimate, frank narrative form which ought to be used by every husband in his home correspondence, details his happy introduction to an English audience. The theme at that time was "America's Place in History." The hall of delivery was in the University College, London; the presiding official, Professor Huxley himself. At the end of the first lecture, says Fiske, "Up came Huxley and squeezed my hand and said, 'My dear Fiske, you have gone beyond anything we could have expected; do you know you have had the very cream of London to hear you?' Sime came up and said, 'My dear boy, I can't tell how delighted I am; you have entranced us all.' Baron Bunsen said, 'I am happy to have de honor of hear so beautiful discourse; accept my warm congratulashón. You do please dese London people most extreme.'" After the second lecture, says Fiske, "Huxley told me he thought I was making a 'tremendous hit.' 'For my own part, my dear Fiske, I will frankly say that I have never been so enchanted in all my life.'" At the close of the last effort, says the happy husband, Spencer, "Who had kept his bright eyes on me all thru the lecture, said, 'Well, my boy, you have *earned* your success; it was the most glorious lecture I ever listened to in all my life.' Ditto and similarly, Ralston and Sime. The 'Orrid 'Uxley' was not there that day—too busy." With such an introduction to "the very cream of London," the three lectures followed the next year, and Professor Huxley, who was there to preside, affirmed his belief that the scientific audience present would all be "convinced

that American political ideas mean much to the future well-being of mankind." The lectures, as now published, have a direct and most important bearing on the great questions of this year of general adjustment of political relations in the various nations of the world, when China is equipping herself with a full assortment of American fundamental ideas, when Japan has already sized up the new demands of great national life and taken her stand on a union of Anglo-American political experiences, and when the whole world is groaning for a new delivery.

The Fighting Races and Other Poems and Ballads. By Joseph I. C. Clarke. New York: American News Company. \$1.

The Irish cause is productive of much good poetry, but in all of it there are few more vivid verses than those in which "Kelly and Burke and Shea" talk over the list of the dead in the sunken "Maine." Two stanzas will recall the poem to the many who know it already. Others should make its acquaintance now it is accessible in book form. Mr. Clarke has a wide range, in topic, time and country, but hardly rises elsewhere to the level of the title poem:

"I wish 'twas in Ireland, for there's the place,"
Said Burke, "that we'd die by right,
In the cradle of our soldier race,
After one good stand-up fight.
My grandfather fell on Vinegar Hill
And fighting was not his trade;
But his rusty pike's in the cabin still,
With Hessian blood on the blade."
"Aye, aye," said Kelly, "the pikes were great
When the word was 'clear the way!'
We were thick on the roll in ninety-eight—
Kelly and Burke and Shea."
"Well, here's to the pike and the sword and
the like!"
Said Kelly and Burke and Shea.

"Oh, the fighting races don't die out,
If they seldom die in bed,
For love is first in their hearts, no doubt,"
Said Burke; then Kelly said:
"When Michael, the Irish Archangel, stands,
The angel with the sword,
And the battle-dead from a hundred lands
Are ranged in one big horde,
Our line, that for Gabriel's trumpet waits,
Will stretch three deep that day,
From Jehoshaphat to the Golden Gates—
Kelly and Burke and Shea."
"Well, here's thank God for the race and the
sod!"
Said Kelly and Burke and Shea.

Literary Notes

....How an alderman cured a sick town is told by W. G. Rose in *Putting Marshville on the Map*. (Duffield; 40 cents.)

....Mrs. Wharton's *Ethan Frome* has been praised by the *English Review* as the most remarkable novel, in certain respects, since Mr. Hardy wrote his earlier stories. In France it has been published in the *Revue de Paris* under the title "Sous la Neige."

....A reader of the *Boston Transcript* writes to the editor in praise of his comments on "Futurist" art. "How dearly beloved the Futurist would have been by the late P. T. Barnum," the letter concludes, "who was something of a Futurist himself."

....The Rev. Lyman P. Powell, of Northampton, Mass., in his booklet on *The Religious Situation in Certain Colleges and Universities*, gives a very encouraging view of conditions in such institutions as Chicago, Kansas, Smith, Wellesley, Vassar and Bryn Mawr, based upon his personal observations.

....A good popular exposition of the first three chapters of Genesis is contained in the addresses of Charles Wenyon, M. D., on *The Creation Story in the Light of Today* (Hodder & Stoughton; \$1.50). The views expressed in clear and reverential style are strictly in accord with the best scientific and religious thought.

....In his volume, *Adventures In Life and Letters* (Kennerley; \$1.20), Michael Monahan appears to have distilled a good deal of literature into a cup of sweet well flavored wine. The dregs in the bottom of the cup are Mr. Monahan's "adventures in life," and they go far toward spoiling the vintage for readers who do not believe in the phallic dance.

....If you are planning a summer fiction library Mrs. Wilson Woodrow's *Sally Salt* (Bobbs; \$1.25) should have its place. In spite of the fact that a beautiful young woman farmer and an engaging and intellectual tramp-hero, together with a gossiping neighborhood, constitute a somewhat trite literary coterie this author is clever enough to combine the old elements in a new and interesting way.

....Dr. Charles J. Baldwin's *The First American and Other Sunday Evening Studies in Biography* (Granville, Ohio: Mrs. Dora H. Case) includes essays on Lincoln, Washington, Jonathan Edwards, Franklin, Paine and other great men and women, including a sprinkling of foreign leaders in religious thought. These essays were originally delivered as Sunday evening church lectures, and were excellently adapted to their purpose.

....Upton Sinclair has long been ambitious to use the theater for the propagation of his ideas. But he does not appear to have yet acquired the playwright's knack. Of his four *Plays of Protest* (Kennerley; \$1.50) only one is really dramatic; that is "Prince Hagen," built upon one of his earliest and most original stories, and telling what the hoard of the Nibelungs accomplished in American politics and society. "The Nature Woman" is an attack upon conventionalities in general.

....A book of more than passing interest is the *Memoirs of Edward Charles Wickham, Dean of Lincoln* (Longmans, Green & Co.; \$2.10) by Canon Lonsdale Ragg, B. D. The larger part of the dean's life was spent as a teacher in Winchester and New College and as successor to Archbishop Benson in the Headmastership of Wellington College. The sketch of his career in these institutions gives many a welcome glimpse into the inside work of English school and college life as well as the picture of an enthusiastic classical scholar and teacher.

....In view of the Hillsville, Virginia, tragedy, Payne Erskine's *The Mountain Girl* (Little, Brown; \$1.25) will have added interest for many readers, being a romance of the Blue Ridge. An English physician of aristocratic inheritance falls in love with Cassandra, the wild and beautiful heroine. There is none of John Fox's atmosphere about this story; it is the conventional narration of a girl's struggle, later on, to adapt herself to strange and "civilized" conditions. The plot is rather amateurish, tho there is a sincerity in the writing, especially while the doctor is among the mountains.

....*The Boy and His Gang*, by J. Adams Puffer (Houghton Mifflin; \$1), is an interesting analysis of boy character based upon a wide study of the real constitution and motives of their voluntary organizations. The author, however, has the fault common to the Clark University school in using anthropology as a guide to morals. Believing that the boy is "essentially a savage with the interests of a savage, the body of a savage, and to no small extent the soul of one," he is disposed to encourage or at least to tolerate too many of his savage instincts, such as fighting

....*Tout abrégé sur un bon livre est un sot abrégé*, wrote Montaigne, whose sentiment Bacon borrowed in calling epitomes "the moths and corruptions of learning." Yet we have not the heart to disparage Edith Sichel's shapeless and, all conditions considered, somewhat heavy volume *Michel de Montaigne* (Dutton; \$2.50) as a "corruption." Certainly it has many of the merits of the essay-

ist discussed: chiefly because he is lavishly quoted thruout the two hundred and seventy-one pages. No attempt is made to add to the great body of original research respecting the Frenchman.

....In *Saints and Heroes* (Holt; \$1.35) Dean George Hodges has given in biographical form a good sketch of the fortunes of the Christian Church from the days of Cyprian to the death of Savonarola. The volume is destined for young folks and is happily adapted to its purpose.

....*What Is and What Might Be* (London: Constable; 4/6), by Edmond G. A. Holmes, contains a severe indictment of the general educational system of the Western world typically illustrated in the English elementary schools. Mr. Holmes believes our shortcomings have been engendered by a slavish following of the formal and mechanical, and could be removed by allowing more freedom and encouraging self-realization as the ideal in education. The strictures as well as the proposed correctives have less application here than in England.

....*To M. L. G.*, by an anonymous author (Stokes; \$1.25), purports to be the confessions of an actress to the man she loved. Aside from those who have a predilection for the literary nude or a curiosity concerning the moral shortsightedness of stage people the book will be of interest to those who like artistic sincerity. There is a great deal of scandalous frankness in the story, but the author's descriptions of a theatrical boarding-house, of an imaginative child's illusions, and of the illusion of that child grown up are presented with extraordinary vividness.

....*The Singing Man*. "A Book of Song and Shadows." By Josephine Preston Peabody (now Mrs. Lionel Marks). In this Book of Song and Shadows, the shadows prevail—black, hopeless for the "singing man," who used to sing in the up-hill vineyards, but now sets the machinery in roaring mills and in the subterranean mine, or under the sea. Fixed are the shadows with all the skill of a master hand. Surely Miss Peabody has grown with rapid pace into one of the most dramatic of our new singers. That she has gained in vigor of statement and in singleness of purpose, no one can deny who reads the opening "Ode on the Portion of Labor" which dominates her latest book of verse. That she has lost nothing in the pure poetic grace and beauty of form and choice of illuminating expression, is made clear enough in "The Golden Shoes" and "The Long Lane." In "The Nightingale Unheard," she closes in on the shadows again, but with a touching note of reminiscence. (Houghton Mifflin, Boston; \$1.10.)

Pebbles

"In Chapter I he shoots at her five times. Ain't that grand?"

"Yes; but them novels are misleading, Mayme. There ain't no earnest love like that in real life."—*Kansas City Journal*.

"WAITER!" said the absent-minded professor.

"Yes, sir?"

"If I have dined bring me the bill. If I haven't, bring me steak and mushrooms."—*Tit-Bits*.

A TEACHER was hearing the class in civics and asked this question:

"If the President, Vice-President and all the members of the Cabinet died, who would officiate?"

The class thought for some time, trying in vain to recall who came next in succession.

James at last had a happy inspiration, and he answered:

"The undertaker."—*Harper's Magazine*.

EGERTON L. WINTHROP, at the end of one of the meetings of the Board of Education in New York, said, apropos of severity in the schoolroom:

"These over-severe teachers always remind me of an over-severe parson. He, at a dinner party during Lent, said to one of the guests, a famous raconteur:

"My dear sir, as it is Lent—and a Friday to boot—would you mind if I asked you to confine your efforts exclusively to fish stories?"

THE English edition of "The Autocrat of the Breakfast Table" contains a critical analysis of Dr. Holmes by Mr. Chesterton, and notes on the text are contributed by a Mr. Blakeney of Trinity College, Cambridge. This is the intelligent comment on "The One-hoss Shay":

"'Hahnsum Kerridge': Surely an anachronism. The patent for 'Hansom Cabs' was not taken out till 1834, or twenty-four years after the date, 1810, given here."

And with careful regard for ALL the facts a footnote is added: "So named from the inventor, Hansom, architect of Birmingham town hall"

A STORY is going around to this effect. T. R. died and went to Heaven. Saint Peter welcomed him eagerly and said:

"Come in; come right in; glad to see you."

T. R. "Yes, I will. I like this sort of thing; but I want something important to do."

S. P. "Certainly. You shall lead the choir."

T. R. "That's good; but I want a big choir."

S. P. "You shall have it."

T. R. "I want a million sopranos."

S. P. "You shall have them."

T. R. "I want a million altos."

S. P. "You shall have them."

T. R. "I want a million tenors."

S. P. "You shall have them."

T. R. "Very good. It is quite satisfactory."

S. P. "But you have no bass."

T. R. "Oh, I will sing bass."

The Independent

Entered at New York Post Office as Second Class Matter

Publisher, Clarence W. Bowen

130 Fulton Street - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, \$3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The "Titanic" and Its Lesson

THE loss of sixteen hundred human beings that perished with the "Titanic," as described elsewhere, was a preventable tragedy. It happened because proper precautions were not taken. Because the owners and the captain thought such an accident very unlikely they did not take proper measures to prevent it. But it was not impossible; and it happened. The captain had been on the sea for forty years, and no such accident had happened to his ship, and he drove at full speed right into the ice floe, trusting to his lookout; and this was one time too many. The unlikely was not impossible and it happened. The huge iceberg was seen too late, and the hugest vessel on the seas was wrecked, with twice eight hundred lives lost.

This fearful catastrophe must have a lesson for them that invite us to cross the sea, and for the governments at whose ports the vessels land their passengers. Because one port is in the United States it is the duty of our Congress to enact the proper laws to protect the lives of our citizens. What are the

immediate lessons, and what the needed legislation to be agreed upon by an international conference?

In the first place, it ought to be forbidden to plow thru ice and fog at such a speed that there is not time to escape collision with an iceberg or another vessel. The "Titanic" was going by the shortest route at full, terrific speed, not less than 21 knots an hour, or 26 miles; a mile in less than three minutes, at the rate of a railroad train, with a hundred times its weight. At that rate it was impossible to veer to one side before striking the iceberg. The collision had to follow, with its fearful fatality. The boat was speeded at this rate, in this dangerous locality, because the owners ordered the captain to make the maiden voyage a speedy one, to advertise the boat and the line. They knew that their patrons want quick trips, love speed, ask for it; and so they sought it at a risk, while telling their patrons that the vessel was unsinkable. There was contributory guilt on the part of all of us who will hurry so, demand dangerous speed, even in our trips of pleasure; but the chief blame rests on those who gave the order for such perilous speed thru ice, instead of taking a longer southern course.

We know the poor excuse, for we have all heard it at sea, that if there be danger at night of hitting a fishing-boat or an iceberg, it is desirable to get out of the danger zone in the quickest possible time. We know better than that now, and we always knew it.

The next lesson which will be put into international law is that there must be lifeboats enough on every vessel to hold all the passengers and crew. The "Titanic" did not have half enough. This seems amazing. To be sure, she had all the British code requires, but it is an antiquated code, made before the era of monster boats. The owners knew there were not boats enough to hold the passengers, to say nothing of the crew. As it was, less than a third of those on board were able to save themselves. Perhaps the owners thought so many boats would cumber the deck; and they thought there was not much danger. But there was some danger, and against even the small danger, sure to come some time, they should have provided.

Law will require it in future. To the ordinary lay mind this appears to be the plainest, most patent lesson of this disaster.

But there is another lesson quite as important. What are boats without seamen trained to lower them from the davits and then man them? There is no feature of this calamity, except the lack of boats, so disgraceful as the lack of men trained to these duties. All devices were at hand to lower the boats, but there was delay from lack of familiarity with the working of them. It was hard work to get them down, because of the lack of seamen. To be sure, this was the first voyage, but even so, before sailing and after sailing, there had been time enough if there had been men to be trained, men enough to lower a dozen boats at a time. But there were not. Boats tumbled and overturned. They were sent off with one oarsman, with none at all, and a stoker in charge. Stokers, stewards and shoeblacks are not seamen. Women passengers even had to take the oars, because no sailor was provided where there ought to have been four at least. Such a condition is amazing. We trust we shall now have laws, such as the seamen's unions have been asking for, which will assure travelers that every vessel will have a sufficient number of competent, trained and certified able-bodied seamen.

We will mention one other point which should be well considered in new legislation, suggested by the lack of seamen. Were half of them killed by the first collision? If the boat had struck the ice head on we should have been sure that they were killed, for their quarters were in the very foremost section of the vessel. The impact would have killed them all. We shall never know the fact, but it would seem that the fore part of the boat, which filled first with water, must have been terribly shattered. If they were not killed they were bunked at the farthest place possible from the lifeboats in a ship a sixth of a mile long. In some vessels the sailors' quarters are amidships, and perhaps they should always be, even at the expense of certain space for the first cabin passengers.

We make no complaint of the size of the "Titanic," or the bravery of its offi-

cers. We believe a big ship is, on the whole, safer than a small one. But a big vessel should be made strong. It may be too much to ask that these big liners should be built as strong as whalers, which are planned to withstand the hug of ice; but when new legislation is to be drawn up it will be well to consider whether our liners are a shell, made thin to save room at the expense of safety. We do not say they are, but there is reason for some concern.

This sacrifice, this holocaust of victims, has been a terrible one; but it is on our dead selves, and on the bodies of our dead fellows, that humanity rises to higher conditions of life. By the loss of sixteen hundred heroes and victims who went to their watery graves to the strains of "Nearer, My God, to Thee," life will be made safer and happier to many, many more in the years to come. Some of them would willingly have offered themselves for such a cause, a dying, as they had learned to be a living sacrifice for the service of the world. Who could doubt this of William T. Stead or Isidor Straus? Who will doubt it of many other men and women who calmly waited death that their dearer ones and others unknown to them might live?

The Law of the Sea

THERE is no law of the sea which requires in the case of accident that the women and children be saved first. There is no law of the sea that the captain of a vessel be the last to leave it, and that he remain on board if one last man or woman has been left to drown. No nation, no international court, has ever enacted either of these laws. They are not laws; they are rules of ideality, of *noblesse*, rules of general consent, which lay down what the high-minded man thinks ought to be done in case of disaster at sea. They are rules of that Christian knightliness which seeks not its own, but the good of others; the captain for his passenger and crew for whom he cares, the men for the women and children of whom they are the natural guardians. These must put themselves last, must save others first, and if

any must perish they will prefer to die. *Noblesse oblige*. Those men, those nations have high honor with whom this rule of the sea has come to be called a law of the sea.

We have heard it said that there is a different rule of the sea and the land in China. We have been told that there in case of danger the custom is to save the men first, because they are the bread-winners, and the boys next, because they will be wage-earners, and the women last, because they will be a burden to society if their husbands are killed. We hope this is not true, and that self-sacrifice for others, even for women and children, is a phase of ideality and heroism which may be expected where, as we have lately seen, men are willing to die for their country's liberty. But in the case of the appalling "Titanic" disaster the one proud thing about it is the calmness with which the captain, the crew and the male passengers stood by and helped the women and children to the boats, that they might live.

There appeared the democracy of humanity. Mistress and maid were as one; the steerage women as the jeweled and guarded ladies of pampered wealth. All had the same honor and protection. The humblest woman, the most defenseless child, took place before the artist of world-wide fame, before the writer who has taught both continents, before the possessor of a hundred millions. When the time comes to die, or the crisis that tests the gold of character, then fame and wealth drop off one like a shorn fleece, and we stand resplendent or befouled, just as we have built or failed to build the beauty of simpleness and gentleness and honor and clean worth into the mold of our lives. To those on the "Titanic" came the test of this fatal crisis, and they were worthy. They stood by as men, only men, brother men, no more, no preference of rank or reputation. They would rather sink than fail of their standard of manly character. We can give them no plaudits worthy of their deed;

"For thereunto doth need a golden quill
And silver leaves them rightly to devise."

But some one will ask, Were it not better that men of such value to the

world as Frank D. Millet, artist; William T. Stead, editor and advocate of peace; Isidor Straus, wise philanthropist, and Colonel Astor, inventor and master of industries, should have been of those first to be saved, and some unknown and unmissed immigrant women of the steerage left to drown in their place? They did not think so. They preferred to go before their God clean-souled than to live ashamed of themselves that they had let others die for them. Could Major Butt, the soldier, the professed champion of the defenseless, return with honor to the President whose legate he was, and consent to live with such a stain? He preferred to die. And we prefer that he should die. We are glad that these men, whose names have been so honorably familiar to us, proved to be what we thought they were. One of old pulled down the two columns of a temple and slew more in his death than in his life; these men, who did so much in their life, and those other men, of equal fiber who sank with them, have taught a lesson in their death which no words of theirs could teach. They are enshrined in eternal praise, an example to the ages. "When Kempenfelt went down, With twice four hundred men," bells tolled and poets sang for the brave who sank with the "Royal George," but theirs was a sudden, instant death, that bore no gleam of glory to edge the black cloud of their loss; but here the pall of grief is all illumined with the light of the grandeur of their death; and to our memory they will forever sit with the gods of elder days, with the heroes who have "fought and sailed and ruled and made our world," made it worth the living in.

And they are not alone. The world is full of martyr spirits, men of the sea, men of the land, men of the mines, men of the fire brigades, who are ready to quit their lives to save their fellows. Yes, and women, a multitude of them, some of whom went down with the "Titanic," like Mrs. Straus, because they would not, could not even be forced to leave their husbands. Can we say that human nature is depraved? Perhaps so, but if so it also finds redemption.

The Reform of Maritime Law

THE amazing fact made known by the disaster to the "Titanic," that the British law does not require such a liner to carry boats sufficient to save half her passengers and crew, has astonished the world. This accident will awaken a drowsy nation to the danger of such negligence, and we may now expect speedy legislation on both sides of the Atlantic. It is a terrible sacrifice that these sixteen hundred human beings have been forced to make that there may be a reform of maritime laws. Let us illustrate from the story of how our present very good law for the protection of seamen was secured.

On March 21, 1897, the big American sailing ship "T. F. Oakes" hobbled feebly into New York harbor. Immediately on reaching quarantine twelve members of her crew were taken to the United States Marine Hospital at Staten Island, all in the most advanced stages of that loathsome disease, scurvy. Six others, all the remainder of her crew, had died and been buried at sea long before her arrival.

The crew of the "T. F. Oakes" had originally been engaged at Shanghai nearly a year before. Thence the ship proceeded to Hong Kong to load for New York. While crossing the China Sea the men realized that the ship was already short of provisions and not properly supplied to proceed on her long voyage to New York. While lying at Hong Kong, therefore, they appealed to the United States consul to be discharged. Their complaints were, however, ignored, and they were ordered to return to duty or go to prison.

The passage was an unusually long one, occupying 259 days. While crossing the Pacific scurvy broke out and two men died. The crew appealed to the master, Captain Reid, to put into Honolulu for supplies. The appeal was ignored. They appealed again later to make for Valparaiso, to be again denied. Two men died off the Horn. The master was appealed to again to call at Montevideo, but were met with the same refusal. Again he refused off Brazil and the West Indies. Meantime two more men died. The last united appeal was

made off the Bermudas, with the answer: "Sandy Hook or hell!" The result was as before stated.

The Social Reform Club, of New York, was interested thru the agent of the Seamen's Union on March 23, 1897, and the victims were visited at the hospital the next day by the Hon. Ernest H. Crosby and the union agent. On March 26 all the resources of the club were voted for the relief of the sufferers; individual contributions were called for and the Sailors' Rights Committee appointed, consisting of Charles B. Stover, James K. Paulding and Ferdinand Meyer, with the union agent to assist. Every possible comfort and protection was given to the sufferers and no reasonable expense spared.

Legal proceedings were instituted in the United States District Court, before Judge Addison Brown. Criminal proceedings were brought in June, 1897, before a jury, resulting in the verdict, "*Not guilty.*" Subsequently, the seamen libeled the "Oakes" for \$91,000 damages. The case was heard in chambers in the fall term of 1897, and damages awarded of \$2,019, to be apportioned among eight of the libellants.

Why such a failure of justice? The United States statute then in force provided that: "Any master or other officer of any American ship who, *from motives of hatred, malice or revenge*, and without justifiable cause, beats or wounds a seaman, or inflicts upon him any cruel or unusual punishments, or withholds from him suitable food and nourishment, shall for every such offense" be punished, etc. Malice was not proved. The second mate of the "Oakes" testified that he had stolen from the galley water in which asparagus and other vegetables had been boiled for the cabin table and thus escaped the ravages of scurvy. Dr. Henry Anthony Baker, called as an expert witness, testified that one case, two dozen bottles, of fortified lime juice served during the voyage, would have prevented the disease.

The ship was sold and renamed the "New York." It was lost on the very next voyage, with cargo, at the entrance to the Golden Gate. Captain Reid re-

PROMINENT VICTIMS OF THE "TITANIC" DISASTER

(1) Isidor Straus, merchant and philanthropist (copyright Pach); (2) F. D. Millet, painter (copyright Pach); (3) Captain E. J. Smith, commander of the "Titanic" (copyright Underwood); (4) William T. Stead, English editor (copyright Underwood); (5) Col. John Jacob Astor, capitalist (copyright Underwood).

turned to his home in Massachusetts and died shortly afterward.

For seven years prior to these incidents seamen had appealed to Congress, but unavailingly, for reforms in the old maritime laws; but immediately after assembling in December, 1898, Congress took up the seamen's petitions in joint conference and passed the White act, which was signed by President McKinley on December 21, 1898. This act entirely changed the whole maritime code, which had existed for hundreds of years, and made a future "T. F. Oakes" case absolutely impossible.

For years the Seamen's Union has been trying to secure amendments to the maritime code of 1898; but without success. A bill has passed the House and failed in the Senate, or has passed the Senate and failed in the House. It provides among other things for the rating of seamen and that a full quantum of able-bodied seamen shall be employed on each vessel. If such a law had been in force on the "Titanic" we should not have seen such difficulty in lowering the boats, nor a stoker in charge of one of them.

Realities and Mockeries

IN quick strokes of blackness the sinking "Titanic" made an imperishable picture of our civilization, its realities and its mockeries.

Those who say that the entire public is blameworthy for the awful sacrifice to greed and folly are not wholly wrong. Producers and purveyors sell what the market calls for. This fact does not exculpate them for wantonly imperiling life, but it makes millions of consumers their accomplices. The "Titanic," and the human community aboard her, were fairly representative of the preferences, the working philosophy and the values which sum up the collective life of our age.

Monstrousness and impatience—the demons that we chiefly serve—were there. Wild extravagance, wanton waste and bizarre display also were there. Credulous trust in untested devices and a reckless gambling on narrow chances were playing their familiar parts. That sober forecasting, which

provides against the unforeseen and unexpected, was absent. Luxury and self-indulgence were there, but the simple appliances to save and safeguard human life were not at hand.

The whole scale of moral values, too, was represented. The abject coward was there, and heroes were there, and among them women as brave as the bravest men that ever have lived and died. Gentlemen were there and brutes were there. Unselfish souls were there, and the craven cad was there, the most despicable product of the ages of evolution.

The indelible picture is complete. It will be handed down thru generations. Centuries from now men will look upon it and will know what our twentieth-century civilization was like.

Can we estimate the proportions in which realities and mockeries are commingled in the life that we are leading? Can we calculate the effect that this almost unexampled tragedy may have in bringing mankind to a more sober realization of what is worth while and what is worthless? Can we form any opinion upon the social forces that are working out the combination of factors, good and bad, in the composition of the commonweal?

Few will deny that mankind in this present generation has so far cared supremely for two achievements that have fascinated us and distorted our judgment because of their mere novelty and crude impressiveness. Bigness and speed have crowded other objects of endeavor out of the competition. To build the tallest skyscrapers—one of which will burn or fall some day with a destruction of life as frightful as that when the "Titanic" sank—to float the heaviest battleships, to create gigantic locomotives, to run railroad trains and automobiles at breathless speed, to amass monstrous fortunes, to create trade combinations more powerful than ancient empires, to expand national and imperial domains to the breaking point—these things have fired imagination and stirred men to an insane fury of effort, destructive of health, sanity, integrity and life.

The causes of our distorted vision and desire are not obscure. Scientific knowledge of the physical universe, applied thru ingenious inventions, has increased

man's power until the feeling of it has intoxicated him. The democratic social movement has swept millions of commonplace folk from their old moorings in religion, nationality and industry, and mixed them up indescribably. They have not been prepared by education or discipline to value supremely worthy things; but, thrown into the swirl of our material prosperity, they have felt the crass appeal of speed and size, of sense-impression and self-indulgence.

Under these circumstances no amount of academic teaching, nor even of impassioned appeal, could have turned the interest of the millions of unformed minds to the things that really count. Full proof of this judgment is the fact that a generation or a little more ago, before the materialistic development was in full swing, both America and Europe were so largely under the influence of good teaching in these matters that optimists confidently expected an age of sanity and happiness. No writer in any generation ever presented the true scale of material and moral values more clearly to the ordinary understanding than Emerson did in America, than Carlyle did in England, than Fichte did in Germany. And writers in this class never were more respectfully listened to by the multitude. Today they are counted among the ancients.

Nothing but calamity, perhaps nothing but calamity over and over repeated, can break the spell of the demons that we worship now. But calamity, sooner or later, will break it. For the worship will bring calamity repeated and repeated, until we turn to other gods. The other gods are clearly enough revealed. He is indeed a dull clod who has caught no vision of them from the behavior of the men and women who quietly chose "the better part" when the "Titanic" went down.

The Presidential Canvass

WE do not see how any thoughtful Republican, desiring success for his party at the polls in November, can find in the present situation a ground for reasonable hope. For several weeks the country has been assured by the eminent Republican who was President for seven

years that President Taft, the party's leading candidate for the nomination, has been and is the associate and tool of corrupt bosses; that he believes our Government should be controlled by an oligarchy; that he and his friends are seeking to procure his nomination by fraud. Mr. Roosevelt continually attacks and denounces not only his party's President, but also the leading representatives of his party. Seeking the nomination for himself, if he should be consistent he would ask for a national platform attacking and denouncing not only Mr. Taft, but also all the policies with which the latter has been identified, and substantially all the latter has done in the last three years. That, of course, would be a political absurdity.

On the other hand, Mr. Taft and his agents are now exhausting the vocabulary of vituperation in their attempts to describe and characterize Mr. Roosevelt, who has been President and whom many Republicans desire to see holding the office again. He is, they say, the "supreme egoist," whom an "alliance of crooked business and crooked politics is trying to renominate and re-elect." He is "the political chameleon," an "arch-demagog," an "arch-traitor to the institutions of his country and to the truth." He is guilty of "corruption" and of "attempted if not actual bribery." He is conducting a campaign in which "no word or deed has been too mendacious or mean" for use if it could help in attaining the end in view. He is spending great sums of money for the promotion of his candidacy, and the money is contributed, they assert, by millionaires connected with the Steel Trust and the Harvester Trust or interested in the retention of high duties on manufactures of wool. His "manifest purpose is to wreck the party which gave him his opportunity to rise." All this we take from statements given to the public at Washington by the manager of Mr. Taft's campaign.

Is it surprising that the Democrats should be rejoicing, and that Mr. Bryan should say:

"It does my soul good to see these two men at outs. When Republicans are divided, honest men get in. In past campaigns I have seen small slivers split from the sides of the

Republican party, but I have never before seen it cleaved thru, root and branch, as it is now."

Mr. Roosevelt's victories, last week, in Nebraska and Oregon, with the reported defection of Taft delegates in South Carolina, do not point to his nomination. The nomination of Mr. Taft may still be expected, and we cannot think that under any circumstances a majority of the Republican convention will vote for Mr. Roosevelt. But if either of these gentlemen should be nominated, after this bitter personal and political contest which is now in progress, could he overcome the opposition of a united Democratic party retaining the strength which it showed at the polls in 1910? This fight is eating out the Republican party's heart.

Independent voters should exert their influence to promote the nomination of the best of the Democratic candidates who have been named, and for the adoption of a good platform for him to stand on. The leaders in the race are Messrs. Clark, Wilson, Harmon and Underwood. Governor Marshall, Governor Foss and others will also have delegates. At the present time it does not appear that any one of these will have even a majority on the first ballot, and a two-thirds vote will be required for a nomination in the Democratic convention. Probably the nominee will be one of the first four we have mentioned. We believe all of them are honest and good men. Three have had much experience in the public service. But lack of such experience does not disqualify the fourth.

Those who stand on the border line in politics and are not bound firmly to either party may well strive to cause the selection of the best possible candidate on the Democratic side. The condition to which the Republican party has been reduced by the assaults of Mr. Roosevelt, which, after a commendable delay, are now answered sharply and perhaps not always wisely by Mr. Taft, points to the election of a Democrat. We remember saying a few weeks ago, when considering the weights which Mr. Roosevelt would be compelled to carry if he should be nominated:

"Only by a great blunder of the Democrats could he be successful. But the nomination of Mr. Bryan is not expected."

We are not sure now, however, that

the Democratic party could not elect Mr. Bryan this year.

Senator Rayner's Attack on Mr. Ismay

We have said much in our leaders on the "Titanic's" loss, but we must say more. In the Senate Mr. Rayner last Friday denounced Mr. Ismay, the head of the White Star Line, as a coward, whose word was not to be believed. We do not say that, but if any man has a temptation to lie it is he. He did certainly send wireless messages from the "Carpathia" to the New York agent of the line that the members of the crew who survived be got out of this country as speedily as possible. Fortunately, a number of them have been detained for examination. There is an enormous temptation to the officers to stand by the company they serve in whatever may be required; but there is no reason why sailors should not tell the truth. The officers in British vessels have to serve an apprenticeship of four years without pay. Then they must pass an examination in seamanship and navigation before receiving a third mate certificate. After one or two more years, with pay at \$25 to \$30 a month, they must pass another examination for a second mate certificate. So they go up from grade to grade. In a passenger vessel the master must be rated as an extra master, and his chief officer must hold a master's certificate. They are very anxious to keep their positions, because if they are blacklisted in one line they are blacklisted in all, and have to go back to tramp service, if they can get it. It is strongly in their interest to defend the line in case of any investigation; but an able seaman discharged from one vessel can take another, and has no interest to conceal the truth. It is his interest solely to have vessels in good condition and well provisioned and cared for.

The passengers tell us that not only were the lifeboats not manned with seamen, so that it was only by the luck of calm weather that they were not stove in against the sides of the vessel when launched, but they were not provided with a necessary outfit and provisions.

A lifeboat should have the following furnishing: A mast and sail, a rudder and tiller; a full set of oars and two extra oars; two sets of rowlocks; two bailers set in beackets (ropes), so that they can slip out; two metallic cylinders to hold bread, and two breakers for water, and a flask of brandy; two axes, two boat-hooks, and a compass; a sea-anchor (drag), with line; two canvas oil-bags and a canister of train-oil; two inextinguishable lamps; a flare-up light; and a safety compartment for matches. There should also be loops of beackets all around the boat for a man in the water to cling to, so that, with life belts, as many men could be supported as could get in the boat. There should also be two competent seamen in charge of each boat, to see to it that it is always in perfect condition, for if not used for years it may become leaky. There were no seamen to be found to man the "Titanic" boats when needed, and the men and women put on board could not know where to find these fittings, if on the boat, or how to use them. There was certainly great failure somewhere, and it is the business of the Senatorial committee to discover where.

Southern Baptist History

Very interesting to THE INDEPENDENT is the memorial to the late Professor Whitsitt, in *The Review and Expositor*, the quarterly of the Southern Baptists, written by Professor Pollard, for THE INDEPENDENT had a notable part in the exposition and defense of Professor Whitsitt's struggle for historic liberty in that great denomination, which resulted in his withdrawal from the presidency of the Louisville Theological Seminary, but nevertheless in the liberalization of the Southern Baptist Church. Professor Whitsitt was a very careful student of Baptist history. He was convinced by his investigations that English Baptists did not practise immersion before 1641. That seems a perfectly innocent conclusion to reach, but it would not seem innocent in the South, where the Baptists were as stiff for immersionist succession as are the Catholics for succession in ordination. In 1880 we asked Dr. Whitsitt to write a number of articles on Baptist history,

to be used editorially, for it would hardly have been wise for him to give his name to them. They had their effect, but did not affect him until, fifteen years later, he wrote an article on Baptist history over his name in Johnson's Encyclopedia, and then the storm burst, for he then acknowledged the authorship of THE INDEPENDENT editorials. We defended his positions and he had strong defense in the Southern Baptist Church; but meanwhile such associates of his as Drs. Broadus, Boyce and Manly had died, and, for the sake of peace, after three years he withdrew from the seminary. To one who remembers the heat of that controversy it is a joy to recognize that the scholarly liberty he then fought for has been achieved, just as the Northern Baptists appear to live in an utterly different atmosphere from what prevailed thirty or forty years ago, when Dr. Bright, in *The Examiner*, and Professor Wilkinson, in THE INDEPENDENT, were fighting the battle of close communionism. We who recall those conflicts, and remember how this journal then opposed the dogmas of formalism, recognize the clearer atmosphere which now prevails, when Baptists invite the Free Baptists into corporate fellowship and union with them. These are comparatively "golden days fruitful of golden deeds."

Italy's "Demonstration"

The Italian Government declares that it has no intention to attack or force the Dardanelles, or to land troops, but that the late engagement was merely a "demonstration." But what has it demonstrated? Apparently, that the European governments, even Russia, would protest against closing the passage to Constantinople and the Black Sea, and, as a consequence of the official Italian declaration to the Powers that it intended to go no further, the Turkish Government has removed the mines that guarded the passage. It was a "demonstration" by the fleet that it was doing something, that it was yet on the sea; and therefore a few shots at a little Turkish vessel encountered near the Dardanelles and at one or two islands. Very likely it was desired to wake up

the European Powers to their desired effort to persuade Turkey to submit to the Italian terms. Yet it is not easy to see how Turkey can be coerced. She does not need to do anything in Tripoli; the tribes inland are doing all that is necessary, with, it would seem, 200,000 of them facing the Italian position and keeping the enemy under the protection of the fleet. So far as we can see, the most that Italy could do would be to capture some of the small islands, while to enter the mainland would bring the Italian soldiers face to face with a superior Turkish force ready to fight. The end is yet far from sight.

A Lesson from the East

Whether the Japanese and Chinese are needed as horticulturists in California or not, this one thing is certain, that our Oriental neighbors have a good deal to teach us about good gardening and good farming. If they were not such skilled tillers of the soil, getting maximum results everywhere, it would be impossible for China to sustain one-fourth of its present population. The Chinese farmer uses only liquid manure, if possible, and he allows not one ounce of Nature's stuff to go to waste. Where the rainfall is deficient the densest population is found. In spite of a drought, during which only 2.44 inches of rain had fallen from October until the last of May, wheat was reaped yielding from fifteen to twenty bushels per acre. A single farmer is reported as sustaining a family of twelve people on two and a half acres, beside keeping a cow, a donkey and two pigs; 192 people are reported as living in comfort on a forty-acre farm. In order not to waste an ounce of straw stubble or weeds, which in a dry climate will not decompose, everything is gathered and artificially fermented, the coarser material being made into bricks for fuel. Beside this, everything in the way of plant life in the villages is carefully preserved for the farms; it is even grown purposely along village streets and in village yards, to be made the fertilizer of the small farms around. How will this do for a lesson to the American farmer? We may not yet be pinched to the extent of the Chinese, but does it pay our farmers

to allow soil material ever to go to waste? It might be well to think of this when tempted to burn a pile of autumn leaves. They should never be destroyed in this way, but should be incorporated with the soil, as Nature intended. Leaves are woven on the tree looms all summer, and then given to the earth for a winter blanket, ultimately to become soil itself.

Just now, when **Compulsory Arbitration** we have the threat of the engineers' strike on our railways, and when the British coal strike has just concluded, it is well to recall how strikes are prevented in some other countries. The countries that have set the example of compulsory arbitration are Australia and New Zealand, and in a minor degree Canada. The two first have almost entirely put an end to strikes, and in Canada they have been much lessened. In Australia two system have been employed to bring peace between employers and laborers. One is that of industrial arbitration, which supersedes strikes and lockouts by bringing disputes for decision before state tribunals of arbitration, whose decisions are final. The other measure is that of the Wages Board system, which stamps out unfair wages and breaks up the sweating system. Wages have been settled in the courts in cases which have covered shipping, mining, boot manufacture, shearing and agricultural machinery. The Australian legislation does not directly recognize unions, as does that of New Zealand. Unions may be registered there, and then they are practically corporations. In case of dispute an official conciliator attempts to bring the parties into agreement. Should he fail, a board of conciliation is appointed, which has power to call witnesses and makes a recommendation which is usually accepted. If it be rejected a court of arbitration is appointed whose decision is final and must be obeyed, on penalty of substantial fines. In Canada there is a similar official conciliator, whose failure to bring the parties to terms is followed by reference to a conciliation board. Lockouts and strikes are forbidden until the board has made its findings, but its recommendations have no

final binding force, as in Australia or New Zealand; but in 90 per cent. of the cases the decision is accepted. In England there is a surprising conversion to the Australian type of legislation, and we must begin to think of it in this country. It has worked well where tried.

We did not care to say it ourselves, but it is cabled from France that the *Paris Temps*, the most influential journal in the French language, ascribes the calmness, the spirit of self-sacrifice, on the part of the men and women on the "Titanic" to the force of religion in the English-speaking people. We know of no other explanation why such scenes were absent as have occurred in other great disasters. This does not mean that all those who died bravely were consciously very religious, altho a multitude of them held their religion dear, but that the teachings of religion and the religious spirit pervade a very large part of both the English and American people. They have learned that it is not decent, not Christian, not Jewish, to live a self-seeking life. The cowards, the poltroons—for such there were—were not religious men. Religion teaches all the manly virtues, and supports them in the fear of God.

Of all occupations dangerous to life the most hazardous is that of life-savers in the United States Bureau of Mines. The annual mortality among them is at the rate of 80 per thousand. In the first year two sacrificed their lives out of a force of eighty, while seven others fell unconscious in the poisonous vapors of mines, but were rescued by their companions. And yet there is no difficulty in finding heroic men ready to undertake the duty. The number of deaths by fire in mines has been a disgrace to humanity, but it is hoped that the better control by Government will reduce this, while the method of rescue will save many lives. Before the service was established forty volunteer rescuers were killed two years ago at Hanna, Wyo., trying to save fourteen men. The two martyrs of the service the past year were Joseph Evans, of Wilkes Barre, Pa., and John Ferrall, of Ellsworth, Pa.

The question is raised in Parliament whether Rudyard Kipling is to be prosecuted for sedition because of his late hysterical poem against the Irish Home Rule bill. We have as yet received but one verse of it:

"What answer from the North?
One law, one Lord, one throne.
England may drive us forth;
We shall not die alone."

What are the men of Ulster about to die for? The language certainly suggests sedition, a war of rebellion; surely disobedience to the law of Parliament. We withdraw no word of praise of Kipling's genius, but such language as appears in that verse does not befit one who has been the champion of England's power to rule the world.

The gentleman who writes for a number of daily papers over the signature of the Marquise de Fontenoy, says lately in the New York Tribune:

"It must be borne in mind that even tho Cardinals Farley, O'Connell and Gibbons are at heart patriotic Americans and members of an American hierarchy, yet they are as Cardinals foreign princes of the blood [what blood, may we ask?] to whom the United States, as one of the great Powers of the world, is under an obligation to concede the same honors that they receive abroad, . . . and at any official entertainments at Washington the Cardinal will outrank not merely every Cabinet officer, the Speaker of the House and the Vice-President, but also the foreign ambassadors, coming immediately next to the Chief Magistrate himself."

Indeed, and holding only an ecclesiastical honor and office?

England burns soft coal, and that makes the atmosphere smoky. If the plan proposed by Sir William Ramsay for burning the coal under ground succeeds it may help to a clear atmosphere as well as to efficiency. He would there take off the gases, whether for lighting or for electric power, and save much of the work of mining. We suspect, however, this would put the manufacturers more than ever under the power of the miners' unions, for by stopping work they could instantly stop the business of the island.

The passengers who were saved from the "Titanic" can, if we understand the law aright, get no compensation from

the White Star Company for their losses. Under an old theory the hazards of the sea are so great that merchants would not build vessels if they were required to reimburse other losses after their own loss of the ship. Accordingly, owners have their choice either to pay damages or to allow passengers or consigners of goods to get what they can from the wreck. In this case they will elect to pay nothing and refer them to the vessel two miles under water.

It is well to speak of the bravery of those who gave themselves to death that others might live, and of the calmness of so many who quietly awaited the end; but we may as well avoid such an outbreak as that of the Maryland Senator who made so bitter and hasty a charge of cowardice on Mr. Ismay. It is too early to do that. We do not know that he failed to do his full duty; and if he was less brave than some others, he may be pitied for the heavier burden of responsibility for the accident which he has to bear.

Our readers will observe the peculiar timeliness of the story "For the Want of a Becket" by our talented sailor correspondent, which we published last week. He is no "fake," but a genuine able-bodied seaman of many years at sea, and whatever he writes is from his own experience in every ocean and many ports. He has kept his eyes open and his memory is prodigious as to the events of the sea. We hope that a few such men will be called by the Senatorial committee in Washington to tell the seaman's side of sea life.

General Edwards, Chief of the Bureau of Insular Affairs, tells a Congressional committee that in the case of war we should be compelled immediately to yield the Philippines to the enemy, and begin our defense at Hawaii. But why should we anticipate a war? It would seem that he has war with Japan only in mind, for no other nation would be likely to meet us there with any success; and a war with Japan is utterly unlikely.

If it was not an April joke that in Germany hereafter cats are to be taxed

to help build the navy, it ought to have been; but it is now declared that it was no joke at all, but really true. It seems absurd, but why not cats as well as dogs? Why not tax women's pets as well as men's? A further enlargement of the navy will require a tax on canary birds.

It would seem that Cambridge University, in England, is not lagging behind in the new sciences, for it has received a gift of \$100,000 to found a professorship for the study of the laws of descent, to be called the Balfour Professorship of Genetics, after the name of ex-Prime Minister Balfour, a friend of the anonymous giver.

Only three or four days had passed before we received a large number of poems on the great tragedy. Every one of our staff of editors wanted to write one, but restrained the impulse. Who would not, if he could, write a "Lycidas" like that of Milton on the loss of a vessel at sea, and a dear friend forced to "visit the bottom of the monstrous sea."

Much has been made of the decrease of 24,538 in the total number of communicants of the Baptists, Methodists and Congregationalists of Wales in the last four years. That is true, but even so, the present number is 58,244 larger than it was before the great revival. The decrease of the last year was very small.

In California, where on May 14 the voters will make nominations in Gubernatorial primaries, there will be 1,200,000 registered voters, and half of them women. In that State the preferences of women will have to be considered hereafter.

It was to attend the religious meetings in New York this week that William T. Stead sailed on the "Titanic" and lost his life. It is a sad opening for the Men and Religion Forward Movement.

The name of Mrs. Isidor Straus will long go down to memory as a Hebrew saint and martyr, worthy to be added to those of Maccabean fame. Not even death could part her from her husband.

Insurance

An Insidious Moral Hazard

INSURANCE companies which make a specialty of providing benefits to industrial workers against disabilities due to sickness or accidental injuries have an element of hazard to contend with that is not at all apparent to the ordinary observer. If the underwriters in this branch had nothing to provide for but the physical factors involved in such an undertaking, their task would be immeasurably simplified. But the plain fact is that the business has developed a distinct moral hazard that can neither be eradicated nor eluded.

The existence of this factor is fully recognized in the business of fire insurance, and, altho, the single losses under it in the latter business, where they occur, are for a larger average sum, it is not as difficult to shun as in industrial accident insurance. It is readily within the means of a fire insurance company, thru its inspectors and traveling special agents, to discover the existence of over-insurance among its patrons, to diagnose impending commercial failures that might be tempered by a fortunate fire, or to "spot" an incipient incendiary who, honest and reputable up to the verge of bankruptcy, is determined to avoid disaster by selling out to his underwriters. But it is absolutely impossible for the industrial accident expert to select from the thousands of persons he insures for a small amount each against accidental death and a few dollars per week partial disability those who for a small injury or a slight illness will dishonestly prolong the period of their alleged invalidity.

Malingering is a noxious and growing evil in all the most advanced manufacturing countries. It has grown to gigantic proportions in Germany under the paternalistic system of compulsory compensation practised there, and, according to a German professor, it has developed a malady known among physicians as "pension hysteria." The

Review of London notes its appearance in Britain, that journal observing that

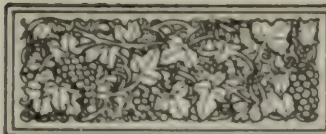

"Men otherwise honest and straightforward appear to have no scruples about seeking to get compensation from insurance companies by exaggeration of their ailments—in other words, scheming to get something for nothing."

Sir John Collie, M. D., insists that they can invent symptoms and boldly endeavor to hoodwink the medical examiner. An English county court judge is reported in the same journal as saying that he cannot conceive why men, being injured in an accident, and seeking for some award under the Compensation Act, do not try some form of light employment instead of sinking, as so many do, into utter inaction—"except, of course, action at law."

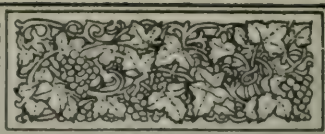

This evil is growing in the United States and, reasoning from the German and English experience, we can expect to see it augment rapidly with the multiplication of workmen's compensation laws in the several States. As a matter of course, the ultimate result of the practice is unwarrantably to increase the cost of the benefit to honest beneficiaries.

At this early date it is impossible even to approximate the insurance losses due to the foundering of the "Titanic." Three classes of companies are involved—marine, life and accident. It is understood that every marine insurance facility in the world was exhausted in an effort to cover the risk, and even then the margin of value uncovered was extremely large. In round figures, it is estimated that there is \$5,000,000 of marine insurance, Lloyds of London being the heaviest loser. On the first and second class passengers there was undoubtedly a large aggregate of life and accident insurance. As the accident companies pay double indemnities for travel accidents, their losses will be not inconsiderable. However, none of the insurance companies interested will be seriously affected by the disaster.

Financial

The Company That Owned the "Titanic"

STOCK market prices (those of the International Mercantile Marine Company excepted) were not affected perceptibly last week by the loss of the "Titanic." The net changes, for a majority of the active railroad issues, were slight, but New York Central showed a gain of $4\frac{1}{4}$. Mercantile Marine common shares lost $1\frac{3}{4}$, closing at $\$4\frac{1}{2}$; the preferred declined to $\$19\frac{3}{4}$, showing a loss of $3\frac{3}{4}$; and the company's $4\frac{1}{2}$ per cent. bonds, which had been quoted at about $\$69$ before the disaster, fell to $\$63\frac{3}{4}$. It will be remembered that the company was formed in 1902 by a consolidation of the American, White Star, Red Star, Atlantic Transport and Dominion Lines. It also controlled the Leyland and National Lines by ownership of stock, and at last reports had more than 125 steamships. It has issued $\$49,931,000$ of common stock, $\$51,730,000$ of cumulative 6 per cent. preferred stock and $\$78,534,000$ of $4\frac{1}{2}$ per cent. bonds. No dividends have been paid, even upon the preferred, with respect to which the accumulated dividends unpaid amount now to 57 per cent. Since 1907 the quoted prices have ranged between $3\frac{1}{4}$ and 9 for the common, between 10 and $27\frac{5}{8}$ for the preferred, and from 53 to $82\frac{5}{8}$ for the bonds. In at least one year the company failed to earn its fixt charges by nearly $\$3,000,000$. At the end of 1910 its insurance fund was only $\$530,000$. It is said that between $\$3,000,000$ and $\$4,000,000$ of the "Titanic" loss will fall upon the corporation. Control is exercised by the following five voting trustees: J. Pierpont Morgan, Charles Steele, J. Bruce Ismay, P. A. B. Widener, W. J. Pirrie. Among the directors are C. A. Griscom, John F. Archbold, E. J. Berwind and George W. Perkins. The president and chairman of the finance committee is J. Bruce Ismay, whose father was the senior member of the firm which owned a controlling interest in the White Star Line. Mr. Widener lost a son and a grandson when

the "Titanic" went down. Heavy payments in cash for several of the properties that were consolidated, and notably for the White Star Line, account in part for the large capitalization and burdensome fixt charges.

While the Mercantile Marine issues were declining, the stock of another company, to whose property and business the disaster directed public attention, was rising by extraordinary additions. This advance, however, took place in the outside market or "curb," and not on the Stock Exchange. The shares of the American Marconi Wireless Telegraph Company, which were selling at $\$2$ in August last, rose from $\$170$ to $\$250$ on the 18th and to $\$350$ on the 19th. While the advance was due mainly to wild speculation, the value of the stock has been increased by the absorption of a rival corporation, a new contract with the British Government and an agreement with wire telegraph companies. The capital was increased last week from $\$1,662,500$ to $\$10,000,000$.

....The world's international trade has doubled in value in the last fifteen years, rising from $\$16,523,000,000$ in 1896 to $\$35,500,000,000$ in 1911.

....Nearly 3,000,000 persons have deposit accounts in the savings banks of the State of New York, and the amount due to them on January 1 was $\$1,619,115,648$, the gain for the year having been $\$76,181,954$.

....The Canadian Pacific Railroad Company is making at Calgary a system of car shops occupying 120 acres, and will construct in a suburb of Winnipeg a railway yard $2\frac{1}{2}$ miles long and half a mile wide, said to be the largest in the world.

....John H. Schooling, a well-known English statistician, estimates that the losses caused by the coal strike in Great Britain have been in the neighborhood of $\$250,000,000$, including direct losses in wages, to the miners and other workers, of $\$80,000,000$.

Survey of the World

The Aftermath of the "Titanic" Disaster

Probably twenty steamers heard the "Titanic's" signal for help, and two liners, the Canadian Pacific "Mount Temple" and the Leyland Line "Californian," were near enough to have saved all hands. The "Mount Temple" did not dare to navigate the ice field. The "Californian," only nineteen miles away, claims not to have known of the "Titanic's" plight until too late. A third vessel, an unidentified schooner, seems to have been actually within sight of the passengers aboard the sinking "Titanic." Freight steamers do not usually carry a wireless equipment, while most passenger steamers rely on a single operator, who is off duty fully a third of the time. The Senatorial examination of witnesses has brought out many tragic details and instructive circumstances, some of which are discussed in signed articles published in this issue. Senator Smith, of Michigan, chairman of the sub-committee, has been criticised at home and abroad for his conduct of the inquisition, it being alleged that he has too severely grilled White Star Line officials and has asked questions which betray ignorance of marine affairs. Some of the British criticism is both ill-mannered and jingoistic. The investigation has extended to the course of Mr. Marconi and his wireless company.—Collision with a great iceberg was narrowly averted by the Canadian Pacific liner "Emperor of Britain," with 1,460 passengers aboard, on April 24, about 250 miles from where the "Titanic" sank.—The Red Star liner "Lapland," with members of the crew of the "Titanic," reached Plymouth April 28. The men were to

have been detained in order that they might make depositions, but the Seafarers' Union interfered, demanding that the men be allowed to go free, whereupon the Board of Trade backed down. The majority of the men replied curtly to the requests that they make deposition, that they were asleep in their bunks at the time of the disaster and knew nothing. The original plan was to have secured evidence and witnesses for the wreck commission, of which Lord Mersey is chairman. The British consul at New York is said to have taken a number of depositions from the "Titanic" crew and others.—The cable ship "Mackay-Bennett" proceeded to the scene of the "Titanic" disaster and recovered more than two hundred bodies, some of which were identified, embalmed and taken to Halifax, N. S. About one hundred corpses, many of them lashed to deck chairs, were sighted by the North German Lloyd steamship "Bremen" on the 20th.—The White Star liner "Olympic" was scheduled to steam from Southampton for New York on April 24. The firemen, greasers and trimmers, however, after inspection of the lifeboats on their own account, found the collapsible boats unseaworthy, and left the ship twenty minutes before sailing time. Next the seamen mutinied. The strikers prevented others from taking their places, and in the end the voyage was given up. On the night of April 27 the Liverpool branch of the Seamen's and Firemen's Union voted that the seamen and firemen on every ship leaving that port should have the right to inspect the lifeboats thru an accredited representative of the union, and should have an increase of wages as well.

**National
Politics**

Mr. Roosevelt's attacks upon Mr. Taft caused the President to reply, last week, in a long address, delivered in Boston. This address was considered by the Cabinet on the evening of the 23d, at a meeting which continued until 3 o'clock on the following morning. The speech in Boston, on the 25th, had been preceded by several incidents of an acrimonious nature. On the 21st, Representative Gardner, of Massachusetts, telegraphed to Mr. Roosevelt a group of charges, asserting that the ex-President had sought to mislead the public concerning the President's attitude toward Senator Lorimer, and had made favorites of certain powerful financial and industrial interests. He challenged Mr. Roosevelt (who had declined to meet him in debate) to produce the report of Commissioner Herbert Knox Smith concerning the Harvester Trust. On the following day, in the House, Mr. Campbell, Republican, of Kansas, asked Mr. Roosevelt to say whether he, while he was President, had sent a note to the Department of Justice directing that action against this Trust be suspended. George W. Perkins, who has contributed large sums for Mr. Roosevelt's canvass, has been prominently identified with this Trust. On the 24th, in response to a resolution introduced by Senator Johnston, of Alabama, a mass of official correspondence relating to the Harvester Trust was sent to the Senate. It appears that in August, 1907, Mr. Perkins called upon President Roosevelt, submitted certain papers, and asked that no action against the company be taken before the completion of an investigation then being made by Commissioner Smith. He argued that the company had sought to obey the law and to meet the requirements of the Government. Mr. Roosevelt, on August 22, 1907, wrote to Attorney-General Bonaparte, referring to Mr. Perkins's visit and arguments, and saying: "Please do not file the suit until I hear from you." The company has not been prosecuted by the Government, but negotiations for a dissolution of it have recently been in progress. Among the papers sent to the Senate was a long letter (September 23, 1907) from Commissioner Smith, commenting upon the

Sherman act and the course taken by the company. This letter did not favor prosecution, but pointed with approval to the attitude of the company and of other allied corporations toward the Government. "It is a practical question," said he, "whether it would be well to throw away now the great influence of the so-called Morgan interests." The context indicates that he probably had in mind their influence in favor of publicity and regulation. The suit was indefinitely postponed. It is asserted that Mr. Smith submitted no report concerning the company. In the Senate, Mr. Bristow remarked that there were indications of collusion in the call for the papers and the prompt response. The Senator from Alabama, he thought, must have known that the papers were ready. That Senator, however, interposed a denial. Mr. Roosevelt published a statement, saying his note to Mr. Bonaparte had been in accord with his custom in such cases, and pointing out that Mr. Taft had not yet prosecuted the company. He asserted emphatically that his action had been approved by his entire Cabinet, after discussion, and that Mr. Taft (then in the Cabinet) had "heartily concurred." On the 29th, however, the President published a statement saying that he never heard the matter discussed in the Cabinet; that neither Secretary Root nor Secretary Wilson heard such a discussion or knew of the commissioner's letter, and that the dates show that he (Mr. Taft) was out of the country, being in Canada for several weeks, beginning in June, and having sailed from Seattle for the Philippines on September 13. The President, in his Boston speech, took up Mr. Roosevelt's charges, one after another, answering them and producing letters with respect to several. Among these was his letter to Mr. Roosevelt about Lorimer, and Mr. Roosevelt's warm commendation of the reciprocity agreement. He also set forth the reasons why, in his judgment, Mr. Roosevelt ought not to be nominated. The speech is considered in our editorial pages. Mr. Roosevelt replied with bitterness in public addresses, accusing Mr. Taft of hypocrisy, and saying it was "a bad trait to bite the hand that feeds you." There were other contributions to this contro-

versy, but the limits of our space do not permit a summary of them.—Mr. Taft received the 8 votes of New Hampshire by a vote of nearly 2 to 1. Rhode Island's 10 delegates were instructed to vote for him. In Iowa he has the delegates at large, and 16 of the entire number of 26. In Missouri the party split, and there are two sets of delegates. Great efforts were made in Massachusetts, where there were speeches by Mr. Taft and Mr. Roosevelt. The President's agents, pointing to the Roosevelt committee's advertisements, saying to voters that they could vote at the approaching primaries without being enrolled in any party, asserted that in this way a bid was made for the support of Democrats, Socialists and Prohibitionists, and that the primaries in Illinois and other States had been similarly affected.

Congress By an amendment to the pending bill for the government of Alaska, Congress authorizes the proposed Territorial Legislature to grant suffrage to women. The amendment was offered by Mr. Taylor, of Colorado.—The Senate, by a vote of 42 to 36, insisted upon its amendment to the resolution providing for a constitutional amendment to permit the election of Senators by popular vote. This Senate amendment says that Congress shall have the right to supervise the elections. In conference it has been accepted by the House.—At the recent primary election in Oregon Senator Bourne was defeated, his opponent, Benjamin Selling, receiving a majority of 6,000. The Senator, well known as an advocate of the direct primary, had made no campaign. "I am testing," said he, "my theory that the people will recognize service without the personal appeal and presence of their representatives." In a recent statement (March 19) he outlined the work he had done. He had fought for the retention of the laws known as "the Oregon system," had secured good committee assignments and large appropriations, and had originated the Presidential primary idea:

"I have more than repaid my obligation to the people of Oregon, and they now owe me more than I owe them. In view of my record and my position in the fight for popular gov-

ernment, my defeat for renomination would be heralded thru the country as a victory for the opponents of popular government. I therefore insist that the people of Oregon, rather than myself, are now on trial, and it is up to them to demonstrate by their votes whether they are intelligent enough to recognize, and appreciative enough to commend, faithful service."

—Secretary Stimson, in a report to the House, shows that the War Department desires to create fifteen flying squadrons (120 machines) of military aeroplanes, an accompanying force of 1,000 men, and five aviation training schools. The department now has six aeroplanes and has ordered as many more.—The Department of Justice has been investigating charges against Judge Archbald, of the Commerce Court, and a resolution asking for a copy of the charges has been introduced in the House. They relate, it is said, to the purchase of a culm bank in Pennsylvania from a railroad company for \$3,500 and the sale of it for \$35,000.—The Ohio Constitutional Convention has rejected provisions for the recall of public officers, judges included.—L. R. Anderson, of the Ohio Senate, has been sent to the penitentiary for nine months because he accepted a bribe of \$200.

Labor Controversies The controversy between the anthracite coal miners and the employing companies has been settled by an agreement which gives the men a wage increase of 10 per cent., but the abolition of the sliding scale reduces the gain. There has been no official announcement of the terms, but it is understood that the appointment of colliery committees is permitted. Such committees give the union an advantage.—The threatened strike of the engineers of 50,000 miles of railroad in the Northeast was averted when Judge Knapp, of the Commerce Court (formerly chairman of the Interstate Commerce Commission) and Charles P. Neill, Commissioner of Labor, in notes to both parties, proffered their friendly aid. Both parties accepted them as mediators, and they have been in conference with committees of the two opposing forces. A settlement by arbitration is predicted.

Trust Questions

It is said that the Government will soon begin suit, in Minneapolis, against the International Harvester Company, or Harvester Trust, the negotiations for a disintegration of the combination having come to nothing. —The Cummins bill, authorizing and directing the Attorney General to appeal to the Supreme Court from the decree in the Tobacco Trust case, has been passed in the Senate, and the passage of it in the House is expected. If it becomes a law, the Attorney Generals of six States, as well as several complaining independent tobacco companies, will join in the appeal. —The Supreme Court, applying the "rule of reason," has decided that the St. Louis Terminal Railroad Association, which controls railroad entrance to the city and passage across the Mississippi, violates the Sherman act. The decree permits a reorganization under specified conditions, involving an abandonment of unjust restraint or monopolization. If these conditions are not accepted, dissolution will be ordered.

Destructive Tornadoes

More than 130 persons have been killed in the Middle West and Southwest during the last few days by tornadoes. On the evening of the 21st storms struck the towns of Bush, Marion and Willsville, in Illinois, and Morocco, Ind., killing 72 and injuring more than 200. When one house in Bush was wrecked, the eight occupants, father, mother and six children, perished. In the preceding night several lost their lives in Kansas. On the 22d, 12 were killed by storms in Adamsville and adjoining parts of Alabama, and 6 in Georgia. On the 27th a tornado swept thru parts of the Texas Panhandle and Oklahoma, killing 41 persons in Kirkland, Foss, Butler, Lugert, Eldorado and other places. So great was the force of the gale that a long freight train was blown from the track and all of its cars were overturned.

The Islands

In the Philippines, 350 miles of new railroad are under construction or will be completed within two or three years. About half the work on nearly 200 miles

of road in southern Luzon has already been done, and a line, 73 miles long, from Manila to Batanzas, has just been finished. A new contract for 110 miles from Lucena to Legaspi, was recently made. —In an engagement between scouts and hostile Moros, in South Lanna, last week, 13 of the natives were killed. —At Washington, on the 26th, in the House, the bill (heretofore described) providing for Philippine independence in 1921, after a probationary period, was reported from committee. The passage of it in the House is expected. —In Cuba, the controversy between the supporters of Vice-President Zayas and the friends of President Gomez has caused the retirement of Secretary Machado, a supporter of Zayas, from the Cabinet.

Central and South America

Minor C. Keith and those associated with him in the construction of the railroad from the Atlantic coast to Guatemala's capital are planning an extension of the line to Salvador. —The war in Paraguay is not ended. Four Government warships bombarded, last week, the camp of the revolutionists, commanded by Colonel Jara, formerly President or dictator, at a point 175 miles below the capital. The response was so effective that they were forced to retire. —The Government at Washington is informed that bubonic plague has appeared at Caracas, the capital of Venezuela. —The Governor of Buenos Ayres has been accused by the radicals of using his power against them unlawfully in the recent election. Warrant for the accusation has been found by the Government's law officers, and he will be prosecuted. —Chili has received bids from several European firms for port improvements at Valparaiso, requiring an expenditure of about \$15,000,000. —Director General Barrett, of the Pan-American Union, who has recently returned from Panama, says that Colonel Goethals, deploring the failure of Congress to provide needed legislation for the canal, may resign. He will give up his office, it is said, if he is required to open the canal without a properly trained administrative and operative force.

Mexico The expected battle near Torreon did not take place last week. It was said that Orozco had 6,000 men at or near Jiminez. The Federal commander offered amnesty to all rebels who would surrender and take the oath of allegiance, but there was no response. In other parts of the country there was much disturbance. Sinaloa was controlled by the rebels, who looted Culiacan, the capital, and opened the prisons. It was said that 2,000 Yaqui Indians were about to join Orozco's army. San Blas, on the coast below Mazatlan, was captured and burned, the inhabitants having refused to buy immunity by a payment of \$10,000. In the south, Puebla was overrun by Zapatists. They also burned a town in Morelos. Huitzilac, less than 100 miles from the capital, was captured by them and sacked. It was soon retaken by the Federals, however, and it is said that 200 of the bandit soldiers were killed. Cuernavaca, where there are now only two Americans, was saved by Federal reinforcements. There was a fierce fight for two days at Tepic, where the cathedral and the state house were destroyed. Many refugees arrived at Galveston from Vera Cruz. They told horrible stories about the atrocities committed by the bandit soldiers. An American ranch owner living not far from that port was beheaded because he could not pay for life. Refugees were also arriving at San Francisco from the west coast. Our Government decided to send an army transport, the "Buford," for Americans stranded on that coast. The ship will carry no soldiers. It was reported that Great Britain, Germany and France were sending cruisers. The owner of a sugar refinery situated on the west coast chartered a steamer to go down from San Francisco and call at several of the western ports for Americans. Owing to talk in Mexico about intervention, American residents became alarmed, and the exodus continued. At the capital, General Alfredo Robles Dominguez, formerly a trusted lieutenant of Madero, and the officer who preserved order in the city when Madero came to it from Juarez, was arrested for plotting Madero's assassination. Congress passed a bill authorizing Madero

to enlarge the army. The Government sent to Washington, as Ambassador, Señor Calero, who, as Minister of Foreign Affairs, wrote and forwarded the recent somewhat objectionable reply to President Taft's warning note. Orozco issued a proclamation, urging all Mexicans to support him, and saying that only by giving resident Americans good treatment could intervention be prevented. The idea of intervention, he added, was to him appalling, as it would mean the loss of independence and of thousands of lives. Brigadier Anson Mills, a retired officer of our army, said intervention would mean war for fifty years and the employment of an army of 250,000 men. Orozco's money chest was replenished by General Terrazas, who obtained from him permission to export 44,000 head of cattle to this country, paying an export tax of \$5 per head. Our Government declared that there was no thought of intervening, but it was known that preparation for possible action of that kind was being made.

French Affairs At a Cabinet meeting, held at Rambouillet on April 27, General Lyautey was chosen French Resident Governor of Morocco.—The story of the revolt in Fez, briefly summarized in last week's INDEPENDENT, was delayed in transmission owing to the death of the four French radiographers. These men had but one revolver between them, with which they slew fifteen Moors before their case was made hopeless by the capture of their building, thru whose roof blazing oil was poured down. Further resistance being futile, the Frenchmen put themselves to death, one of them living long enough to tell his story to the relief expedition. Moorish women were conspicuous in inciting the mob, which behaved with true Arab atrocity. The French and Hebrews who were their victims were indiscriminately maltreated, even after death, and without regard to sex or age. Before French reinforcements arrived, under command of General Moinier on April 21, the bank at Fez had been pillaged and the palace burned. There has been criticism of the Govern-

ment for not foreseeing and preventing this occurrence, which duplicates an experience in Tunis soon after the French occupied that province. Fez is now under martial law; 10,000 Jews are said to be homeless and starving. Arab tribes in other districts of Morocco are said to manifest a warlike spirit. A holy war is threatened.—The establishment of a protectorate in Morocco, which makes France the dominant Power in North Africa, inspires her statesmen with imperialistic visions of a trans-African railway, extending to the Indian Ocean, and, besides developing Central Africa for commerce, winning for France a great part of the traffic which now passes thru the Suez Canal. Senator Gauthier issued last week details of a plan for this railway, which would reduce to secondary importance the proposed line running from Oran, Algeria, to connect with the Cape to Cairo Railway. From the French Trans-African Railway would be run branches serving Tunisia, Algeria, Morocco, Senegal, Guinea, Dahomey, the Ivory Coast, the Kongo and Ouadai; the main line following the Mediterranean coast from Tangier to Larache, passing thru Fez and Taza, skirting Lake Chad, and crossing Abyssinia to Juba. The cost of the Tangier-Juba railway is estimated at \$600,000,000.—On April 28, Bonnat, the notorious bandit and supposed leader of the automobile terrorists, and Dubois, an accomplice, were located in a garage at Choisy-le-Roi, in the outskirts of Paris. They immediately opened fire upon the police who surrounded the building much as the London officers did in the battle of Sidney street on January 3, 1911. Dynamite was used by the besiegers, but death came to the two automobile anarchists thru self-administered poison in the one case and thru the twelve pistol shots which the other, Bonnat, received. Earlier in the week the assistant superintendent of the Paris Detective Department, M. Jouin, was shot dead, and a chief inspector seriously wounded, while trying to arrest these criminals. The garage where they were finally killed belongs to one Fromentin, an "idealistic anarchist." Moving picture machines were busy while the engagement was in

progress.—The death of Henri Brisson, president of the Chamber of Deputies, occurred in Paris on April 14. M. Brisson was born in Bourges seventy-six years ago, and as a Republican propagandist under the Second Empire his name is to be associated with those of Ferry, Floquet and Louis Blanc. Under the Third Republic M. Brisson twice served as Prime Minister, in 1885 and 1898. One of his unsatisfied ambitions was to become President of the Republic. M. Brisson was a Free Mason, a lover and student of Voltaire and the Encyclopedists, and, of course, an ardent anti-Clerical. He presided over the Panama Inquiry Commission in 1893, and over the Chamber of Deputies from 1894 to 1898 and continuously since 1905. M. Brisson has been given a public funeral.—In a speech to the General Council of the Department of the Neuse the French Prime Minister, M. Poincaré, recently spoke of the importance of the questions of foreign policy which had from its creation faced his Cabinet. He said:

"The government has desired, above all, to secure in its diplomatic action singleness of aim, consistency, and clearness. Its endeavor has been to make it impossible that any one in Europe should be under any misapprehension as to our pacific intentions or as to our determination to defend the interests and dignity of France."

His Government firmly maintains and cultivates, he added, the alliance with Russia and the "cordial understanding" with Great Britain. The Prime Minister referred also to the questions of electoral reform and proportional representation, which may finally determine the fate of the Government. He once more declared himself a partisan of proportional representation, while he did not minimize its difficulties. He commented on the difficulty of the Government securing on this question a homogeneous Republican majority, stating that many of the *soi-disant* Republican politicians professed opinions of Church and State which were inconsistent with republican tenets. The Government was on the side of those who maintain the secular character of the state—*la laïcité de l'état*.—A notable delegation has brought to New York the bronze bust executed by

Rodin, which is to be placed at Crown Point, Lake Champlain, N. Y., on May 3. The delegation reached New York April 26 on the new liner "France," which was making her maiden voyage from Havre. The ship is the largest of the French Atlantic mercantile fleet, its tonnage being 30,000, and its speed on a trial trip having reached 24 knots. Mr. Robert Bacon, who has been succeeded as American Ambassador to France by ex-Governor Herrick, of Ohio, was a passenger aboard the "France." The president of the French delegation bringing the Rodin bust is M. Gabriel Hanotaux, a former Minister of Foreign Affairs and a member of the French Academy. Other members of the delegation are the novelist René Bazin and Etienne Lamy, both members of the Academy; General Lebon; Fernand Cormon, president of the Academy of Fine Arts; the Vicomte de Chambrun, secretary of the embassy, representing the Minister of Foreign Affairs (M. Poincaré); the Comte de Rochambeau; the Duc de Choiseul; M. Barthou, formerly Minister of Justice; Baron d'Estournelles de Constant, Senator and peace advocate; Vidal de la Blache, the geographer, a member of the Institute and representative of the University of Paris; M. Blériot, the aviator, and the Paris journalists, MM. Gignouse and Gaston Deschamps. The delegation has been greeted at New York by Mayor Gaynor and at Washington by the President. The bust by Rodin is that of a woman representing France, shown against a bronze background, whose inscription may be translated as follows:

On July 20, 1619, the Frenchman Samuel de Champlain discovered the Lake which bears his name.

On May 3, 1912, the States of New York and Vermont erecting this monument,

A French Delegation presented this figure of France

The Paris *Figaro* published on April 26 a leading article, written by M. Hanotaux before he set out for America, expressing the hope that the visit of the delegation might bring closer together the two great republics. He writes:

"We have common interests and common aspirations. History shows how close we have been in the past, and if the politics of nations knows how to second the natural

movement of things our relations in the future will be still more intimate."

The French historian thinks that the United States in its dominant position between the two oceans will fill more and more the rôle of world arbitrator; adding, "as the United States leans to one side or to the other, so will the world lean." He concludes his article in stating that France occupies in the Old World a place analogous to that of the United States in the New.

Russia The recently announced Russian naval program promises to endow the seas which wash the coast of the empire with fleets fitted to defend them against possible aggression, the Baltic receiving eight battleships, sixteen protected cruisers, thirty-six destroyers and twelve submarines. The necessary expenses are distributed over a term of eighteen years. In the Black Sea Russia will maintain a naval force one and a half times as great as that of the bordering Powers. In the Pacific she will have the two cruisers, eighteen destroyers and twelve submarines held to be requisite to the defense of Vladivostok. In 1904 the Baltic squadron was despatched to the Far East, where it was annihilated at Tsoushima, on May 27, 1905. The Baltic coast of Russia and Finland has, since then, been open to attack or disembarkment.—The Russian plan for national insurance of factory workers against sickness is embodied in a bill which has already passed its third reading in the Duma and awaits discussion in the Imperial Council. If carried into effect this measure will oblige the owner of every industrial establishment to provide his employees with free medical attendance and free medicines. The owner of establishments employing more than 200 hands must form a sick club, 2 per cent. of the wages of the employees being set aside as benefit funds, of which amount two-fifths will be subscribed by the employers, three-fifths by the workers. There are other arrangements, and a scheme of state insurance against industrial accidents.—M. Sazonoff, Russian Minis-

ter of Foreign Affairs, outlined, in a speech in the Duma on April 26, his Government's policy in the Far East. Russia did not, he said, seek territorial expansion in Asia such as would be likely to weaken her position in the Near East. She did not intend to annex Mongolia, but only to protect Russian interests in parts of China contiguous to Asiatic Russia. Otherwise, her policy would be entirely neutral; if intervention ever became necessary, she would adopt America's suggestion that all the interested nations act together. Russian interests at the moment only required that there be no military state set up in Mongolia. The respective positions of Russia and Japan in Manchuria are so much alike that the governments naturally look to one another for mutual support, the Foreign Secretary continued. Referring to the dispute between America and Russia over the Jewish passport question, M. Sazonoff evoked general applause by saying that his Government was resolved not to tolerate outside interference with her inalienable right to shape domestic legislation.

YUAN SHI-KAI

The latest portrait of the Chinese President

China Dispatches from Peking announce the general clearing out of the Government departments. This applies even to the police force, which must, apparently, be newly recruited and organized. The Cabinet will abolish all titles, and every one, from highest to lowest, will be "citizen," as during the French Revolution. Dr. Sun Yat-sen recently delivered a speech at Wu-chang against the retention of Peking as the capital, on the ground that the city is under foreign domination. He favors making Nanking the permanent capital of the republic. The newspapers announce the appointment of Sir Francis Taylor Piggott, Chief Justice of the Supreme Court of Hong Kong, as legal adviser to the Chinese Government. Sir Francis was legal adviser to the Prime Minister of Japan from 1887 to 1891, and was secretary to the British Attorney General, Sir Charles Russell, M. P., in the Bering Sea arbitration, in 1893. He was born in 1852, was graduated from Trinity College, Cambridge, and is an authority on international law. The Chinese Government has canceled the Belgian syndicate's \$50,000,000 loan, acceding to the demands of the United States, Great Britain, France and Germany. About \$5,000,000 had already been advanced, however. Dr. Eliot, the president emeritus of Harvard University, is now in Peking, whence he will soon progress to Japan. He has recovered from the operation for appendicitis performed in Ceylon.—The British legation at Peking has information that the Chinese are being driven from Tibet into India by thousands, those remaining in Tibet being massacred. The Chinese President has ordered troops sent to Tibet, whose revolt he means to put down at any cost.—Tax riots are reported from Tungan, on the eastern coast of Kwang-Tung province. Traffic in that district is at a standstill. From Che-kiang it is reported that the cultivation of the poppy on a large scale has been resumed, even in the prefectural city. No steps are being taken to suppress the growing of opium. In the execution of robbers and others in this province the republicans have initiated an innovation. Condemned prisoners are now chloroformed before they are shot.

MAETERLINCK expresses his idea of happiness thru the symbol of the Blue Bird. Ostwald expresses his by

$$G = E^2 - W^2$$

Poets and scientists both are necessarily symbolists. The apparent conflict between them is chiefly a difference of taste as to the choice of symbols, for both stand together in opposition to the great mass of near-sighted humanity, who live exclusively in the concrete, too absorbed in the consideration of particulars to discover for themselves the One in the Many. The most conspicuous difference between the symbolism of poetry and that of science is that the former is old and the latter new. The poet prefers to go to antiquity for symbols, bringing down from the attic to the living room some metaphorical heirloom, enriched by the associations of generations and carrying with it a penumbra of indefinable suggestions, which makes it appear to mean more than it does. So Maeterlinck chooses for his fairy play "The Blue Bird," which had lived in folk lore for countless ages. But the scientist prefers to invent a new symbol for the occasion in order to get something that shall convey neither more nor less meaning than what he himself puts into it at the time. Poets and artists of all sorts get credit for greater perspicacity and prophetic power than they deserve, by reason of later generations reading into their sayings much more meaning than was ever in the mind of the author. This unearned increment of reputation, compounded annually, is all that keeps some ancient authors alive nowadays. But the man of science disdains such support and is careful to define his terms so that

posterity may give him no more credit than he thinks he has earned by his own exertions.

The scientific symbolism is not only more exact than the poetic, but it is also more practical. Doubtless "The Blue Bird" of Maurice Maeterlinck and "The Blue Flower" of Henry Van Dyke have contributed to happiness as well as stood for it, but they are not of much service in showing which of two courses in any dilemma will lead to it. The unpoetical reader might suppose that to be blue was to be happy. Ostwald, however, insists that his formula is not a mere mathematical jest, but applicable to practical affairs, and like a true physician he has tried it on himself and knows that it works. He tells us that he solved one of the most difficult problems of his life by its aid, as, for example, when at the age of fifty-three the question arose whether he should remain professor of chemistry in Leipzig University or retire to his country place at Gross-Bothen to take up the new profession of "practical idealist."

An interpretation of Ostwald's formula for happiness,

$$G = E^2 - W^2$$

will enable the reader to try it for himself. *G* stands for happiness (*Glück*). This, according to the theory of energetics is dependent upon the amount of energy expended, might in fact be measured by the amount of carbon dioxid produced by conscious activity if we could separate this from the unconscious physiological processes of the body. Part of this Energy is expended in agreeable ways; let that be represented by *E*. But there is always another part of conscious activity which is unpleas-

ant, such as painful feelings, disagreeable thoughts, unwilling duties; that may be represented by W (*widerwillig*).

The second term ($E^2 - W^2$) of the equation may be resolved into the two factors $E + W$ and $E - W$, and increase of either will tend to increase the amount of happiness. The way of the strenuous life is to increase the first, ($E + W$), the total expenditure of energy; that is to exert one's self to the utmost in desired directions, even tho opposition and anxieties increase also; to bring up the health to its highest point that the supply of chemical energy may not fail; to cut down as much as possible on sleep, for that is the time when both E and W sink to zero. This is what Ostwald calls Hero-happiness (*Heldenglück*).

But men of more timid temperament prefer to devote their attention to the other factor ($E - W$), because herein lies the danger, not merely of no happiness (when $G = 0$), but of unhappiness, for G becomes a minus quantity when W is greater than E . They strive rather to reduce W , the unpleasant part of life, than to increase E , the pleasant. To avoid risks, to curb ambition, to limit desires, to curtail expenditure, to seek contentment rather than delight—this is the way of the simple life and leads to Hut-happiness (*Hüttenglück*). This may indeed attain the same result, give an equal value for G , but the happiness so reached is very different in kind, tho equivalent in degree, to that for which strive men of the type of Napoleon, Edison and Roosevelt. The search for happiness by limitation instead of expansion leads at its extreme to stoicism, to asceticism, to nirvana, to the state of mind of Diogenes, who threw away his sole utensil, the cup, when he saw a man drink out of his hand.

Many moralists before Ostwald have attempted to put this idea into semi-mathematical form, generally with the object of advising the seeker after happiness to take the lower and smoother road. Carlyle says in "Sartor Resartus":

"The Fraction of Life can be increased in value, not so much by increasing your Numerator as by lessening your Denominator. Nay, unless my Algebra deceive me, Unity itself divided by Zero will give Infinity. Make thy claim of wages a zero, then; thou hast

the world at thy feet. Well did the Wisest of our time write 'It is only with Renunciation that Life, properly speaking, can be said to begin.'"

James, in his "Principles of Psychology," expresses it as follows:

$$\text{Self-esteem} = \frac{\text{Success.}}{\text{Pretensions.}}$$

That is, our self-esteem is determined by the ratio of our actualities to our supposed potentialities. And he suggests that some Bostonians "would be happier men and women today if they could once for all abandon the notion of keeping up a Musical Self and without shame let people hear them call a symphony a nuisance."

William Winter puts the thought in rime:

"I have set my heart on nothing, you see
And so the world goes well with me."

One is irresistibly impelled to quote Johnson's remark:

"Sir, that all who are happy, are equally happy, is not true. A peasant and a philosopher may be equally *satisfied*, but not equally *happy*. Happiness consists in the multiplicity of agreeable consciousness. A peasant has not capacity for having equal happiness with a philosopher."

Boswell tags this in his usual style with the observation that this very question was "very happily illustrated" by the Rev. Mr. Robert Brown at Utrecht, who said that "a small drinking glass and a very large one may be equally full, but the large one holds more than the small."

Ostwald applies his formula to James's "Varieties of Religious Experience," and shows that the convert leaves the mourner's bench at the moment when the factor ($E - W$) changes its sign from minus to plus. (Here W apparently stands for the devil.) The equation also serves him as an argument against the use of alcohol and other narcotics, which, tho they temporarily reduce W by sinking all unpleasantnesses below the threshold of consciousness, are likely to make happiness a minus quantity. Wealth, being the most compact and convenient form of energy, may serve to increase E or diminish W , but not in proportion to its amount. Dramatic criticism may even be made mathematical. Jaques has a large W ; Rosalind has a large E ; put them together and you have "As You Like It."

But I should not devote so much space to what is merely an extreme and, some would say, an extravagant application of Ostwald's philosophy.* It is, however, a characteristic example of his mode of thought and may serve as well as any other to introduce the reader to his fundamental theory of energetics, which formed the leading principle of his chemical work, and which he has now carried over into the fields of philosophy and sociology.

It is not necessary to explain the modern conception of energy, for we all learned about it in our schooldays, and here we need only have in mind its two fundamental laws. The first is the law of the conservation of energy, discovered by Mayer, which states that the amount of energy remains unchanged whatever its transformations. To take a familiar example, when we buy coal we are really buying chemical energy, not carbon. When we burn it we let the carbon go off up the chimney, but the heat energy we keep as completely as possible, and by means of a boiler transform it into the expansive energy of steam, which is converted into the motion energy of piston rod and wheel, and when connected with a dynamo may become electrical energy. The electrical energy we can conduct by a wire into our homes and there convert it into the light energy of an incandescent bulb, the heat energy of an electric griddle, or the motion energy of a fan or carpet sweeper. That is, whenever any kind of energy disappears some other kind of energy crops up somewhere in exactly equivalent amount. In any experiment where they can be measured the income and outgo of energy will be found to balance exactly, just like a bookkeeper's ledger.

But here is another thing to consider. The fact that a trial balance comes out even does not prove that the concern is not losing money, and we see the same thing in the energy business. In the series of transformations we have followed above, from the coal of the power house to the utensils of the household, there is leakage all along the line, a little lost in friction and radiated heat in each

of the machines, and a big waste, some 85 per cent., in the steam engine. Ostwald uses the ingenious illustration of a traveler who goes thru Europe changing his money at every frontier, and losing a little each time thru the changer's dis-

W. Ostwald

*The reader who is interested and reads German will find a full discussion of the formula and its significance in *Die Forderung des Tages*.

count. A good money changer is one who is satisfied with a moderate commission. A good machine is one that gives back to us almost as much as we give it. But there is none perfect, no, not one.

This is the second fundamental law of thermodynamics,* the law of the degradation of energy. For energy has a sort of gravitation of its own. It always wants to run down hill. Heat seeks its level as well as water. If we lay a hot plate, say, at a temperature of 100° , on or under a plate at zero, the heat will spread to the cold plate until both are at 50° , disregarding radiation losses. And when they have come to the same temperature it is impossible to get out of them any further heat movement. "You cannot run the mill with the water that's gone by." You have to have a fall of temperature to run any kind of heat engine. Every machine, every chemical and physical process, every living being, is leaking energy all the time, that is, transforming it into unavailable forms. That is the way we get our living. The sun is dissipating its heat energy thruout space at a great rate. Our allies, the plants, manage to catch a tiny bit of it and store it in starch and oil, but we eat these and send the energy on its way as heat again. The whole universe, regarded as a big machine, is running down like a clock and, it seems, must ultimately come to a stop, unless, indeed, there is a self-winding attachment hidden away in it somewhere, or somebody outside of it all to wind it up occasionally.

This, however, is one of those questions which Ostwald calls "pseudo-problems" and from which he would free us by applying the energetic philosophy. His test is the following: "Suppose the problem solved and assume any one of all possible answers to be correct, we can then investigate what effect this would have on our conduct. If it produces no effect the problem is thereby indicated to be a pseudo-problem." He takes for example the following:

"Did the world have a beginning in time or has it existed from all eternity? By the way

*My unconventional definitions of the second law would be repudiated by any self-respecting physicist. The reader is therefore warned that the proper way to say it is, "the entropy of the universe tends to a maximum." (Clausius.)

of experiment we will assume that it has existed since eternity, and will ask what would change in our conduct by this knowledge? I find, at least for myself, that nothing would change by this knowledge, and just as little if we assume that there was a beginning in time. Hence I must say that even if I positively learn in some way which of the two possibilities is correct, it would be a matter of perfect indifference to me, and this being the case we have here a pseudo-problem. The significance of this procedure is apparent from the answer to the question as to what we call 'correct' or 'true.' The answer was that which enables us to make accurate predictions. Something that does not allow us to make any prediction whatever is essentially of no interest to us in any way, and there is no need of being concerned about it."—"The Modern Theory of Energetics" (*Monist*, 1907).

This, of course, is the pragmatic method, and Ostwald acknowledges the relationship by observing: "Energetics coincides with that movement which has originated on philosophical ground and which pursues very similar ends under the name of pragmatism or humanism." The pragmatic mode of thinking is practically universal among scientific men, but Ostwald is an extreme pragmatist. Prophecy is the sole aim of science, according to him, and he virtually denies the possibility of applying the terms truth and falsehood, in the strict sense, to the statements of history.*

To catch what we can of this stream of energy and to utilize it to the best advantage, is the aim of human endeavor, the measure of civilization. Wealth in all ages consists essentially of the command of energy, whether counted by slave power, horse power or kilowatt hours. In order to show how Ostwald's sociology grows out of his physics, let me quote the concluding paragraphs of his little book on "Natural Philosophy":

"The objective characteristic of progress consists in improved methods for seizing and utilizing the raw energies of nature for human purposes. Thus it was a cultural act when a primitive man discovered that he could extend the radius of his muscle energy by taking a pole in his hand, and it was another cultural act when a primitive man discovered that by throwing a stone he could send his muscle energy a distance of many meters to the desired point. The effect of the knife, the spear, the arrow, and of all the other primitive implements can be called in each case a purpose transformation of energy. And at the other end of the scale of civilization the most

*Was ist Wahrheit? (*Monistische Sonntagspredigten*, Nr. 5).

LANDHAUS ENERGIE

Professor Ostwald's country home at Gross-Bothen

abstract scientific discovery, by reason of its generalization and simplification, signifies a corresponding economy of energy for all the coming generations that may have anything to do with the matter. Thus, in fact, the concept of progress as here defined embraces the entire sweep of human endeavor for perfection, or the entire field of culture, and at the same time it shows the great scientific value of the concept of energy.

"If we consider further that, according to the second fundamental principle, the free energy accessible to us can only decrease, but not increase, while the number of men whose existence depends directly on the consumption of a due amount of free energy is constantly on the increase, then we at once see the objective necessity of the development of civilization in that sense. His foresight puts man in a position to act culturally. But if we examine our present social order from this point of view, we realize with horror how barbarous it still is. Not only do murder and war destroy cultural values without substituting others in their place, not only do the countless conflicts which take place between the different nations and political organizations act anticulturally, but so do also the conflicts between the various social classes of one nation, for they destroy quantities of free energy which are thus withdrawn from the total of real cultural values. At present mankind is in a state of development in which progress depends much less upon the leadership of a few distinguished individuals than upon the collective labor of all workers. Proof of this is that it is coming to be more and more the fact that great scientific discoveries

are made simultaneously by a number of independent investigators—an indication that society creates in several places the individual conditions requisite for such discoveries. Thus we are living at a time when men are gradually approximating one another very closely in their natures, and when the social organization therefore demands and strives for as thoro an equalization as possible in the conditions of existence of all men"

From the same fundamental conception Ostwald derives his system of ethics, which he sums up in "the energetic imperative":* *So act that the crude energy is transformed into the higher with the least possible loss.* This forms the text of several of his lay-sermons, one of which was recently printed in *THE INDEPENDENT* (October 19, 1911). Efficiency, that is, the ratio of work to means, of accomplishment to opportunity, can be made the measure of a man as well as of a machine, since Ostwald includes all thoughts and feelings as forms of energy. This scientific conception and ideal of efficiency, developed in the laboratory, was first introduced into the shop, thence it has crept into business management, and has even made its unwelcome appearance in university ad-

**Der energetische Imperativ. Ann. d. Nat. Phil.*, Vol. X.

ministration. It cannot be much longer kept out from the capitol, the church and the home. It is, in fact, the contribution to our civilization by the fourth and newest of the learned professions, that of the engineer. He it is who has started us all wondering how much of what we daily do pays us in any coin, has made us anxious to see some relation between effort and result, has rendered us impatient of unnecessary delay, friction, lost motion, wasted work, unutilized material and retarded rewards.

To distinguish low and high forms of energy, says Ostwald, we should consider their relative importance for human purposes. Thus bread must be regarded as containing a higher form of chemical energy than wood, altho they are very similar in chemical composition and produce about the same number of calories of heat on consumption.

Kant's categorical imperative, "So act that your conduct may be taken as a universal law," is, in Ostwald's opinion, neither so comprehensive nor so definite as his energetic imperative, which includes ethical conduct, but is not confined to it. We call one automobile "good" and another "bad" if the former will carry us twice as far as the latter on the same amount of gasoline consumed. A "good" friend is one who helps us in our endeavors thru judicious advice and without annoyance, while a "poor" friend only multiplies our difficulties; here again goodness and badness are determined by the ratio of the total en-

ergy employed and the results obtained. It is this second principle of thermodynamics, the law of the degradation and dissipation of energy, that prevents us from undoing the past, that gives significance to such phrases as "time flies" and "the world moves." The cosmic process is not a reversible reaction. Nietzsche's nightmare of the eternal recurrence, which drove him insane, would have been dispelled by a knowledge of elementary physics.

The second law is therefore of greater importance to philosophy and sociology than the first, the law of the conservation and transmutation of energy. Ostwald's recognition of its significance gives to his philosophy a character decidedly different from the view dominant in the last century, the mechanistic theory of the universe. It is a curious thing that Haeckel, the biologist, has, by basing his philosophy on the first law, been led to extreme mechanistic views, while Ostwald, the physical chemist, by placing greater emphasis upon the second law, comes to conclusions much better suited to the explanation of vital phenomena.

According to the old mechanistic theory the world could be reduced to two elements, matter and motion. Everything was held to consist in reality of atoms, in those days generally assumed to be indivisible and eternal. Each atom was at a given instant moving in a certain direction at a certain speed. It followed from this, as was suggested in the

A SNAPSHOT

Taken in 1904 at the International Congress of Arts and Sciences, at St. Louis.

Philosophical Magazine some twenty years ago, that if each atom should be suddenly stopped and sent going back on its track with the same speed, all events would be reversed and history be repeated backward. If we were watching Waterloo, for example,* we should see the dead men rise up one by one, pick up their guns, point them at their enemies, receive into the gunbarrels the gases produced by the explosion of powder, and walk off backward. Napoleon starting as a prisoner at St. Helena would end as Emperor of the French.

We have all of us had this idea pictorially presented to us in moving picture shows when the film is run thru the lantern backward and we see apples leaping from the ground and attaching themselves to the limbs of the tree, and swimmers diving up out of the water and lighting on the springboard. In fact, the reversed film of the cinematograph may be regarded as the *reductio ad absurdum* of the mechanistic hypothesis. We might expect that a piece of music would sound just as well if we put the perforated paper roll into the player piano wrong end first—but somehow it doesn't. We all feel instinctively that there is something ridiculous and impossible about this idea of reversibility when applied to human beings. Even the chemist and the physicist can effect this reversibility only to a limited extent and in special cases, as, for example, when energy is supplied from some external source. A sled can indeed be made to go up hill as well as down, but it is hard work to make it. Wood will burn easily, but no chemist is yet able to get the wood back out of the gases of combustion. The second energy law was taught to us in our infancy by the parable of Humpty-Dumpty.

Bergson bases his theory of the comic† upon the idea that the absurdest of all things is to regard a human being as a machine. That the world is, like man, not rightly to be regarded as a machine is the fundamental theme of Bergson's "Creative Evolution," so there is a striking similarity in point of view between Ostwald and Bergson, notwithstanding their diversity of temperament

and style. It may be recalled that Bergson also entered into the realm of metaphysics thru the door of mathematical physics.

As early as 1895 Ostwald announced "the overthrow of scientific materialism";* a startling declaration coming from one of the greatest of chemists at a time when chemistry was almost exclusively absorbed in the transformations of matter and only beginning to recognize the importance of the concomitant transformations of energy. When the chemist had put upon the blackboard the equation of a reaction or the structural formula of a compound, he was apt to think that he had told "the truth, the whole truth and nothing but the truth" about it. Against all such crude conceptions Ostwald protested vigorously, preaching a new iconoclasm in the words of the old: "Thou shalt not make unto thee any image or any likeness of anything that is in the heaven above, or that is in the earth beneath, or that is in the water under the earth; thou shalt not bow down thyself to them, nor serve them." He demanded "a science free from hypotheses"; formulas that should merely state what is known to take place, in the place of mechanical models and misleading visualizations. "Matter," said this professor of the most materialistic of the sciences, "is merely a form of thought," which is the same conclusion that Kant had come to a hundred years before in regard to time and space. But whereas Kant had said, "Give me matter and I will build a world out of it," Ostwald would say, "Away with matter, I will build a world without it."

"The Actual, that is, what acts upon us, is energy alone," but in so speaking Ostwald must not be understood, as he often is, to imply that energy is the sole substance of which the world is composed. Mass is merely one of the two factors which make up the product known as energy. What the common man regards as the attributes of matter, its hardness, heaviness, color, etc., are simply the effects of various forms of energy on his sense organs.

Coal should be sold by calories, not tons. Even the courts, slowest of human institutions to take cognizance of new

*Die Ueberwindung des wissenschaftlichen Materialismus. Lübeck address before the German Association of Naturalists and Physicians.

ideas, have come to the conclusion that energy is an entity, for now they will convict a man for stealing it from a third rail, tho perhaps they regard the current as a stream of corpuscles. The unifying value of the energy conception appears when we consider the old riddle of the relation of the mind and body. Between the brain, regarded merely as a collocation of moving molecules, and the mind, regarded merely as a succession of states of consciousness, there is no conceivable connection and dualism is inevitable. But if we regard both as forms of energy, the difficulty disappears. The "pre-established harmony" of Leibnitz then becomes the established unity of Ostwald. The idea of energy had its inception in human action, so it is not an alien form of thought. It was borrowed originally from psychology by physics and there is no impropriety in taking it back.

In the revolution which has within the last twenty years transformed chemistry from an empirical science based upon material conceptions to a mathematical science based upon energetic conceptions, Ostwald has been a leader. Qualitative and quantitative analysis which had been hardly more systematic and rational than a kitchen recipe book became in his hands a new and delightful study in which even the beginner could use his mind as well as his fingers. Professors of chemistry who had got along happily all their lives with a knowledge of arithmetic as far as and including percentage suddenly found themselves in need of calculus and other things of that sort. Yale graduates who went to the Leipzig laboratory in the nineties to continue their chemistry were set to study the works of Willard Gibbs, whose name they may indeed have seen in the catalog of their alma mater, but whose acquaintance they were not likely to have made. What was worse, they had to get up their Gibbs in German,* since the original papers in the "Transactions of the Connecticut Academy" were not available, and even in English Gibbs is not light reading. It was Ostwald who first recognized Gibbs as "the greatest scientific genius that the United States has so far

produced," and made his work known to Europe, where it has served as the guide and inspiration of some of the most fruitful investigations of the last two decades.

This is eminently characteristic of Ostwald. His own researches, great as they are, may without injustice be regarded as of less importance than the unique service he has rendered to his science by the discovery and prompt utilization of original theories and generalizations, whether found in the forgotten files of the journals and transactions, in the papers of his contemporaries or the work of his students. This was a task requiring both genius and generosity. What he did for Gibbs, the American, he did for van't Hoff, the Dutchman, and Arrhenius, the Swede, and many others, living and dead. He has always taken a keen interest in individuals. He is not content with the mere name of a great authority in a footnote. He wants to know what manner of man he was and in what words he first made public his discovery. This led him to cultivate the neglected field of chemical history and biography. Most chemists knew nothing at first hand of the work of the men they glibly referred to in their lectures, Avogadro, Bunsen, Dalton, Berzelius, etc. Nor could they have easily become acquainted with them if they had cared to, for the original papers were often inaccessible. So Ostwald started in 1889 his series of "The Classics of the Exact Sciences," reprinting important papers with notes.

In 1887, when few people knew that there was such a thing as physical chemistry, he founded a journal for it, the *Zeitschrift für physikalische Chemie*, now in its seventy-eighth volume, and not room enough yet in its 2,300 pages a year to record the progress of the science. In 1902, when most scientists scoffed at the idea of philosophy, he started another venture equally bold, the *Annalen der Naturphilosophie*. During this period of sixteen years his literary output, not counting the two periodicals and the eighteen volumes of the "Classics of the Exact Sciences," already mentioned, included twenty-two books of 15,850 pages altogether; 120 papers making original contributions to chemi-

*J. Willard Gibbs: *Thermodynamische Studien*. Uebersetzt von W. Ostwald. Leipzig: W. Engelmann. 1892.

cal science comprising 1,630 pages; addresses and dissertations amounting to 300 pages; and some 3,880 abstracts and 920 book reviews in his journals. Every chemical library has upon its shelves (the plural is usually necessary) "the big Ostwald," the *Lehrbuch der allgemeinen Chemie*, the size of a cyclopedia, with the dates of its volumes strung along thru the eighties and nineties, tho "the little Ostwald," the *Grundriss der allgemeinen Chemie*, shows more wear on the binding. And all that, it must be remembered, represents only one side of the activity of this extraordinary man, for during the period of this enormous literary production he was professor of chemistry at the University of Leipzig and director of one of the busiest research laboratories in the world.

We find in our American universities nowadays many men who are so absorbed in their investigations that they refuse to consider either the philosophical or the practical aspects of their science, and they resent as an insult any demands made upon their time by the outside world. Ostwald has never been so busy as that. Notwithstanding the fact that he has carried on researches in pure science which have obtained for him the Nobel prize, he has not disdained to write letters to painters on the use of pigments and to lecture to housewives on the chemistry of cooking, as well as to bring his knowledge of science to bear upon the educational, social and religious questions discussed in the periodicals of the day.

When we inquire why no American chemist has yet been honored by a Nobel medal, we are apt to be told that laboratory facilities in this country are too inadequate. Ostwald has never been hindered by this obstacle; not in Riga, where he was his own mechanic and glass-blower, equipping the laboratory with home-made burettes, induction coils and galvanometers; not in Leipzig, where he worked under conditions that have been described as follows:*

"The Leipzig laboratory, in which he worked until 1897, was situated in the *Landwirtschaftliche Institut*, an old pile originally devoted to agricultural chemistry, and in every way unfitted for the carrying on of those delicate experiments which brought Ostwald to the fore-

front of scientific workers. Research was carried on under countless difficulties; the light was bad, the rooms unventilated, the heating effected by means of stoves difficult to regulate and producing dust which caused much injury to the finer instruments; no precautions had been taken in laying the foundations to ensure the deadening of vibrations; thus many experiments were ruined; the lack of space precluded the use of telescopes for reading scales, and altogether it would have been difficult to construct a laboratory worse adapted for physico-chemical investigations."

In one respect, it must be said, the current of scientific thought has gone quite counter to Ostwald's views. The atomic theory, which he was desirous of doing away with, has become substantiated and extended. The kinetic theory of gases has not been displaced by his concept of "volume-energy," and now the motion of the molecules has been made visible by Professor Millikan, of the University of Chicago, and we hear talk of the "atomic theory of electricity," the "corpuscular conception of light" and the "granular nature of energy." Even time and space show a tendency to disintegrate and become discrete. But the tide may turn at any moment and Ostwald's conceptions once more become fashionable in scientific circles.

As I say, Ostwald does not appear to be a busy man. Would a busy man take the heart out of a fair summer day to devote himself to the entertainment of a wandering American journalist? If I had not known that he was an editor of two periodicals and a leader in some of the most important movements of the day, I might have supposed him a mere gentleman of leisure, as he sat with me on the porch of his country home, willing to talk freely on any topic I suggested, willing even to listen when I wanted to talk, with never a longing look thru his study door at the heavily laden desk and silent typewriter. A big man, as well as a great man, is Ostwald; genial in manner, direct of speech. His bushy blond beard has mostly lost the color it had when first I saw him in 1904 at the St. Louis Congress of Arts and Sciences, and his hair is quite white and now cut short, bristling an inch or two all over his head. He would be recognized as a German professor by his look and bearing, if he were seen anywhere on the globe, yet he could not be called a type specimen, for he is free from the vices

**Nature* 64, 428 (1901).

to which the average German professor is most addicted, the love of beer, tobacco and Latin. Also, he hates dueling, altho recognizing that it is not so dangerous as American football.*

But unconventional as his views may appear, it must not be thought that Ostwald is a faddist. His is a reasoned radicalism, not originating in mere neophilism or iconoclasm, but in the application of scientific principles to the problems of daily life. What distinguishes Ostwald from most other philosophers is his willingness to put his principles to the test of experience by striving to live up to them.

Our conversation was in English necessarily, for tho I had taken my first German lessons from Ostwald over twenty years before—using his *Lehrbuch der allgemeinen Chemie* as a primer, instead of Grimm's *Märchen*—he had not been at hand to teach me to speak it. Ostwald, however, speaks English as readily as he does German—or French or Russian or Ido. His biographer relates that when he was learning English in the Riga *gymnasium* he had great difficulty in pronouncing "the," until he discovered that he could get the sound by filling his mouth with *Zwieback*; on the same principle, I suppose, as Demosthenes used pebbles. Now, however, he manages his *th's* perfectly, and I don't think he had *Zwieback* in his mouth when he talked with me.

His language was particularly fluent and forcible when he came to discuss the question of teaching languages. The chief point in his indictment of the German *gymnasium*, or secondary school, is the excessive time and excessive honor given to linguistics. He regards the new scientific school (*Realschule*) as almost as bad as the classical *gymnasium* in this respect, for modern languages are there taught in much the same way as the ancient. The absorption of the student's attention during the impressionable years of his youth in the idiosyncrasies of German grammar or the monstrosities of English spelling, does not cultivate, but actually impairs the power of logical and original thinking. Ostwald ascribes Nietzsche's perverted ideas, his misconception of the struggle for exist-

ence and his hatred of the common people, to his training in classical philology. He brings forward as a cause of the failure of Austria-Hungary to produce its proportional share of great men, the linguistic struggle which absorbs the energy of its people. The barrier of local language is one of the causes of international friction and lost motion which grieves the mind of a physicist. As a means of overcoming this friction—a linguistic lubricating oil, as it were—he favors the formation of an international auxiliary language, especially for scientific and commercial purposes.* I suppose one reason why he thinks it possible to construct an artificial world language is because he has seen it done. The rapid expansion of the science of organic chemistry within the present generation has necessitated the invention, as the need for them arose, of more new words than Shakespeare's vocabulary contained. Some of these are cumbrous, it is true, rather formulas than words, but remarkable for their succinct significance and are largely common to all languages. Ostwald has recently constructed a complete new nomenclature of chemistry in Ido and proposes soon to use it for all the abstracts in his *Zeitschrift für physikalische Chemie*, so that the student, after a few hours spent in learning Ido, will have free access to all the literature of this science. Professor Ostwald assured me that he had tried putting his philosophy into the new language and found it of great benefit in giving clarity and definiteness to his thought. The adoption of an international language he regards as an important part of the

*Ostwald devoted the \$40,000 he got from the Nobel Fund to the attempt to introduce a new language, Ido. Mistral devoted his to the attempt to perpetuate an old language, Provençal. So we see that dynamite money, like dynamite itself, exerts its force in opposite directions.

Ido is a simplified form of Esperanto, originating in the refusal of Dr. Zamenhof to allow any reforms in the language he had invented. It drops the accented letters and accusative form of Esperanto and utilizes a larger proportion of romance roots common to all European languages. The official organs are *Progreso* (Paris: 3 Rue le Gof) and *The International Language* (London: 32 Cleveland Square). Ostwald's new chemical nomenclature began in the May, 1910, number of *Progreso*. The volume by Ostwald, Jespersen and three other professors, entitled *International Language and Science* (London: Constable, 1910), contains an interesting test of the capabilities of the new language, the translation into Ido and back again into English by another person of a page of James's psychology with almost no loss in the process. W. J. Phoebus, 768 East Nineteenth street, Brooklyn, is an American advocate of Ido and may be addressed for information.

*Kultur und Duell in *Die Forderung des Tages*.

ON THE SHORE OF RUGEN
From a pastel by Wilhelm Ostwald

peace movement in which he is now actively engaged. I asked him if he expected that arbitration treaties would put an end to war, and he explained that they would act like a block signal system on a railroad, not always preventing the disaster of war, but lessening the chances of it.

So Ostwald, having won the Nobel chemistry prize in 1909, is in a fair way to become in time eligible for the Nobel peace prize. It is in fact characteristic of the man that, having achieved success in one field of human endeavor, he should turn his attention to another. It is part of his theory of the art of life. I was curious to know why he had left Leipzig and chemistry for Gross-Bothen and philosophy, had abandoned one of the greatest of universities and the most popular of the sciences for the Saxon village and a field of thought reputed as unproductive. He explained to me that in early years he had a leaning toward philosophy, but in those days the subject was looked upon with disfavor. Now things have changed. People realize that it is necessary to take a wide as well as a close view. Civilization advances by alternating periods of specialization and

generalization. We are now entering upon the second phase.

Then, too, he had come to the conclusion from his study of great scientists that the men who had accomplished most thru the prolongation of their productive period had done so by changing their occupation two or three times in the course of their lifetime; for example, Helmholtz, who devoted the first half of his adult life to physiology and medicine and the last to physics, being equally eminent in each; and Humboldt, who kept up his work to the close of his ninety years by shifting from one field of science to another. Having come to this conclusion Ostwald, as an experimental scientist, was obliged to try it upon himself. The success of the experiment indicates that rotation of crops is a good plan in menticulture as well as agriculture.

He carries out the same principle in his daily life. When tired with philosophizing he turns to painting. This he finds relieves the mind better than anything else, for it sends the blood to another side of the brain, while if he tries to secure rest by lying down the brain goes on working in the same old lines.

This absorption in artistic effort he has used in his Harvard lecture on "Individuality and Immortality," when he is arguing that the highest happiness is found rather in the obliteration of individuality than its persistence. This conclusion is familiar to us as that of the mystics, but Ostwald reaches it characteristically by another way, the second law of energetics. After speaking of the tendency of liquids and of heat toward diffusion and consequent loss of identity he applies the principle to society and psychology. The passage is worth quoting because it is practically a direct contradiction of Spencer's fundamental theory that evolution is a progress from homogeneity to heterogeneity both for matter and for energy. The difference results, I think, chiefly from the fact that Spencer's attention was fixed upon the first law, that of the conservation of energy, for the importance of the second law, that of the dissipation of energy, was not recognized till long afterward.* The reader will notice that the second law is decidedly democratic in its implications.

"It is a strange thing indeed that by merely being associated with another thing of the same kind identity is lost. And still more strange is the fact that every being of this kind seems driven by an irresistible impulse to seek every occasion for losing its identity. Every known physical fact leads to the conclusion that diffusion, or a homogeneous distribution, of energy is the general aim of all happenings. No change whatever seems to have occurred, and probably none ever will occur, resulting in a concentration greater than the corresponding dissipation of energy. A partial concentration may be brought about in a system, but only at the expense of a greater dissipation, and the sum total is always an increase in dissipation.

"While we are as sure as science can make us about the general validity of this law as applied to the physical world, its application to human development may be doubted. It seems to me to hold good in this case also, if it is applied with proper caution. The difficulty lies in the circumstance that we have no exact objective means of measuring homogeneity and heterogeneity in human affairs, and we can therefore not study any given system closely enough to draw a quantitative conclusion. It seems pretty certain that increase of culture tends to diminish the differences between men. It equalizes not only the general standard of living, but attenuates also even the natural differences of sex and age. From this point of view I should look upon the accumulation

of enormous wealth in the hands of a single man as indicating an imperfect state of culture.

"The property which has been described as an irresistible tendency toward diffusion may also be observed in certain cases in man. In conscious beings such natural tendencies are accompanied by a certain feeling which we call will, and we are happy when we are allowed to act according to these tendencies or according to our will. Now, if we recall the happiest moments of our lives, they will be found in every case to be connected with a curious loss of personality. In the happiness of love this fact will be at once discovered. And if you are enjoying intensely a work of art, a symphony of Beethoven's, for example, you find yourself relieved of the burden of personality and carried away by the stream of music as a drop is carried by a wave. The same feeling comes with the grand impressions nature gives us. Even when I am sitting quietly sketching in the open there comes to me in a happy moment a sweet feeling of being united with the nature about me, which is distinctly characterized by complete forgetfulness of my poor self. We may conclude from this that individuality means limitations and unhappiness, or is at least closely connected with them."

Professor Ostwald showed me the studio which now takes the place of the laboratory. It is still part laboratory, for he is experimenting in pigments and has invented new forms of crayons or pastels and methods of fixation. In painting, as in everything else, he works with rapidity and effectiveness. Three days at Niagara Falls gave him two dozen or more pictures. He has a good eye for picturesqueness and uses vivid and varied coloration. He utilized his time at the University of California to get some fine views of Berkeley and Professor Loeb's seaside laboratory. His stay at Harvard as exchange professor in 1905 gave him many scenes from Marblehead and Cambridge, among them a striking picture of the Harvard stadium seen across the river flats and looking as imposing as the Coliseum. Photography he has practised from boyhood. It was by this and the manufacture of fireworks in his mother's kitchen that he took his first steps in chemistry. He has always been fond of music, both as listener and performer, playing the violin well, and, says his conscientious biographer, the bassoon very badly. We are also told that in his student days he composed a symphony, wrote much poetry and applied himself diligently to the study of the laws of motion by ex-

*Spencer laid the foundation of his philosophy in the essay on Progress: Its Law and Cause more than twenty years before the publication of Clausius's *Die mechanische Wärmetheorie*.

perimenting for hours on the impact of elastic ivory balls upon a plane green surface.

Walking, however, has ever been his chief recreation, if we can call that a recreation which is the means of his most productive thought. After lunch he showed me about his estate, a wooded upland overlooking the village houses, clustered about kirk and *Gasthaus*, and, beyond, the level, orderly Saxon landscape, with its leisurely windmills. The winding walks appear to be sufficiently long to enable him to evolve undisturbed the most complicated German sentence. The stranger can find his way to *Landhaus Energie* by inquiring of a villager for "the house with the big post box," for when Ostwald took up his residence in Gross-Bothen this provision had to be made for the enormous mail coming to him from all parts of the world.

One can generally tell in Germany the date of erection or occupancy of a country house by whether it is called a "*Villa*" or a "*Landhaus*." The Germanic movement is bent upon expelling all the foreigners from the language. So now we see *Fahrkarte* in place of *Billet*, formerly used; *Fernsprecher* in place of *Telefon*; *Zweikampf* in place of *Duell*, and *Einheitslehre* in place of *Monismus*. The adoption of an international auxiliary language would, Professor Ostwald explained to me, facilitate this movement, for it would leave each local language to develop in its own way, free from the penalty of isolation.

I thought, as I walked back thru the smooth, clean, tree-lined road to the railroad station, that here at least was a man who had attained that internal peace and happiness, that external honor and usefulness, which theoretically should reward all philosophers. Few men have so wide a fame in science. Still fewer have so many devoted friends among their former students. That he has any personal enemies it would be hard to believe, tho he has many opponents. He has earned his success by his own exertions, working his way up to his present position by sheer force of character and ability. He was the second son of a master cooper of Riga, an old Hansa town of Baltic Russia. He was born September 2, 1853, and educated at the Real-gymnasium of Riga and the Uni-

versity of Dorpat, Russia (1872-1875). His dissertation at the conclusion of his course here, on "The Mass Action of Water," broke new ground in a field that he was henceforth to make his own. He thought himself lucky then to secure a position as assistant in physics at Dorpat at \$250 a year, because this gave him an opportunity for research, and his master's and doctor's dissertations attracted attention by their bold adoption and development of the new theories of solutions and affinity. He utilized his vacations at Riga in cultivating—by means of piano and paintbrush—the acquaintance of Fräulein Helene von Reyher, whom he married when he was twenty-seven. His comrades reminded him that not long before he had declared that he would never marry, for he should devote all his time to science. But he answered, "I had to marry, because the girl interfered with my work." The measure was efficacious, for she has not interfered with his work since, even finding time to assist in his literary labors, altho she has brought up five children. They took their wedding journey in a postwagon from Riga to Dorpat and set up housekeeping with a kerosene stove and a small piano as their principal furniture; no sofa. Readers who understand the importance of the sofa in a German household will appreciate the deprivation. The next year he was called to his native city as professor of chemistry in the Riga Polytechnic, and in 1887 he left Russia for Germany to take the chair of chemistry at Leipzig University.

In his study of men of science Ostwald has introduced the distinction of classicist and romanticist. The classicist keeps to one line of thought and develops it by himself logically and completely. His mind works mathematically, and he is fond of systems and formulation, often addicted to dogmatism. He is accurate and thoro, but deficient in experimental ability and regardless of practical applications. He is reluctant to publish and is apt to be a poor teacher, exerting little personal influence on his students and sometimes none on his contemporaries.

The romanticist, on the other hand, is usually a good teacher and often the founder of a school of thought. He has

the expansive temperament and genial disposition; fond of conversation and given to rapid publication. He carries on many different lines of work at the same time and is eager to put them into practice as soon as possible. He is an adventurous theorizer, willing to risk a leap in the dark, arriving at conclusions by a sort of intuition and not always able to explain how he got his results. He is, therefore, liable to make conspicuous mistakes and is apt to be impatient of details. The romanticist gets paid in current coin, that is to say, in the devotion of his disciples and in honors from his colleagues, sometimes even in applause and wealth from a grateful public. The classicist has to put up with deferred payment, and his services to science often receive no adequate recognition until after he is dead and sometimes not then.

Among American scientists we have almost perfect specimens of these two genera. Count Rumford was a typical romanticist and Willard Gibbs a typical classicist, and there was, as I have shown elsewhere,* the greatest possible contrast in their characters and careers. Ostwald, it is unnecessary to say, has all the characteristics of the romanticist. He has become a world teacher thru his books and periodicals. He has trained in his laboratory Arrhenius, Nernst and many others of almost equal eminence. He has had the satisfaction of seeing his abstract theories become the working basis of enormous industries.

It is worthy of note that the science which in Germany has been most closely connected with the universities and in which the most pure research has been done, has developed most rapidly and proved most profitable. The annual value of the products of the chemical industries of Germany is about \$300,000,000. And this is only one of the sources of the new wealth which is coming to Germany and making that country one of the foremost of world powers. In Great Britain emigration exceeds immigration, while in Germany of late the reverse is true, altho in Germany the increase in population from the surplus of births over deaths is 900,000, twice what it is in Great Britain. At this rate in ten years from now Germany will have a

population of 74,000,000 and Great Britain only 47,000,000. And the wealth of Germany is increasing faster than the population, notwithstanding the heavy drains of army and navy. I asked Professor Ostwald the cause of Germany's amazing prosperity. "We Germans believe in science," he answered simply.

HOW TO READ OSTWALD.

The only one of Ostwald's philosophical works which is obtainable in English is the *Grundriss der Naturphilosophie*, published in Reclam's *Universal-Bibliothek* (Leipzig; 40 pfennigs), and translated last year by Thomas Seltzer and published by Henry Holt & Co., N. Y., under the title *Natural Philosophy*. This is intended as a succinct popular exposition of the fundamental principles of all the sciences and is mostly devoted to a systematic consideration of the theory of knowledge and laws of logic. It is, therefore, not so interesting to the general reader as some of his untranslated works in which he discusses a variety of ethical and social questions from the scientific standpoint, as for example *Die Forderung des Tages*, "The Day's Demands" (Leipzig: Akademische Verlagsgesellschaft). His *Grosse Männer* (same publisher) contains biographical sketches of Davy, Mayer, Faraday, Liebig, Gerhardt and Helmholtz as well as his general observations on the character and training of scientific discoverers. Ostwald's Harvard lecture on *Individuality and Immortality* was published by the Houghton Mifflin Company, 1906, 75 cents. He is now issuing a series of informal talks on scientific ideals and morals under the title of *Monistische Sonntagspredigten* (Verlag des Deutschen Monisten-Bundes in Berlin W. 57, 20 pfg). A few of the titles will indicate their character and scope: "Love One Another," "The Jatho Case," "How Evil Came into the World," "What Is Truth?" "Nietzsche and the Struggle for Existence," "Natural Science and Paper Science," "The Philosopher's Stone," "Efficiency." The last named was published in THE INDEPENDENT, October 19, 1911. An article, "Breaking Barriers," appeared in *The Masses*, February, 1911. It is greatly to be desired that all of these "Monistic Sunday Sermons" as well as "The Day's Duty" and "Great Men" be translated into English as they represent a point of view of growing importance in modern thought.

Other articles by Ostwald accessible in English are: "The Philosophical Meaning of Energy," in *The International Quarterly*, vol. 7; "The Modern Theory of Energetics," with criticism by Dr. Carus, in *The Monist*, 1907; "Chemical Energy" in the *Journal of the American Chemical Society*, August 1893, and in the *Smithsonian Report* for 1893; "A Contribution to the Theory of Science," his address before the Section of Methodology at the St. Louis Congress, in *Pop. Sci. Monthly*, 1905, p. 219; "The Art of Making Discoveries," in *Sci. Amer. Sup.*, No. 1807; a character sketch of Sir William Ramsay in *Nature*, January 11, 1912.

*"Leading American Men of Science." (Holt & Co.)

Of Ostwald's chemical works the following have been translated into English: *Conversations on Chemistry* (Wiley; \$2). *Manual of Physical and Chemical Measurements* (Macmillan; \$2.25), trans. by James Walker. *The Scientific Foundation of Analytical Chemistry*, trans. by G. McGowan (Macmillan; \$2). *Solutions*, trans. by M. Pattison Muir (Longmans; \$3). *The Principles of Inorganic Chemistry*, trans. by Alex. Findlay (Macmillan; \$6). *The Fundamental Principles of Chemistry*, trans. by Harry W. Morse (Longmans; \$2.25). *Letters to a Painter on Theory and Practice*, trans. by Morse (Ginn; 90 cents).

The serious student of Ostwald's thought will of course devote himself chiefly to his *Annalen der Naturphilosophie*, of which the tenth volume is now completed (Leipzig: Akademische Verlagsgesellschaft; 14 marks per volume). In the Lübeck lecture, *Die Ueberwindung des wissenschaftlichen Materialismus* (*Zeitschrift phys. Chem.* 18, 305-320, and separately published by Veit, Leipzig, 1895), and the *Vorlesungen über Naturphilosophie* (Veit, 1902) he laid the foundations of his theory. In *Die energetische Grundlagen der Kulturwissenschaft* (Leipzig; 1909) he extended it to include the science of civilization. In *Die wissenschaftliche Stellung* (*An. d. Naturph.*, vol. x), he defends himself against certain misconceptions, as for example, that he makes energy the sole reality in the world, or a metaphysical principle like Hartmann's "Unconscious." Ostwald's educational views may be found in chapters of *Die Forderung des Tages*, in the article on "The University of the Future and the Future of the University" (*An. d. Naturph.*, vol. x, p. 236), and in *Wider das Schulelend, Ein Notruf*, (Leipzig: Akad. Ver.; 1 mark). *Erfinder und Ent-*

decker contains sketches of Mayer, Helmholtz and Liebig (vol. xxiv of *Die Gesellschaft*, Frankfurt a. M.: Rütten und Loening; M. \$1.50). *Die Energie* is a popular exposition of energetics (vol. i of *Wissen und Können*. Leipzig: Barth; M. 4.40).

An intimate and appreciative sketch of the life and work of *Wilhelm Ostwald* was written by P. Walden on the twenty-fifth anniversary of his doctorate (Leipzig: Engelmann; 4 marks). Two of our illustrations are borrowed from this volume.

There is space here to give only a few references to discussions and criticisms of Ostwald's theories. Dr. Roberty in *Energetique et Sociologie* (*Revue philosophique*, January, 1910), shows the vast importance of Ostwald's extension of the laws of energetics to vital and social phenomena. A painstaking comparison of the contradictory theories of Lombroso and Ostwald on the character of genius is contributed by Georg Wendel to *Zeit für Philosophie*, 1910. In the *Vierteljahrsschrift für wiss., Philosophie und Soziologie* for 1905 will be found *Bemerkungen über die Metaphysik in der Ostwald'schen Energetik*, by F. W. Adler, and *Atomistik und Energetik von Standpunkte ökonomischer Naturbetrachtung*, by Hermann Wolff. F. Dennert in his volume on *Die Weltanschauung des modernen Naturforschers* (Stuttgart, 1907) devotes a chapter to Ostwald.

I must also mention the valuable articles contributed by Dr. Fielding H. Garrison to the *New York Medical Journal*, September 11, 1909, on "Physiology and the Second Law of Thermodynamics," in which he discusses the application of the theories of Gibbs and Ostwald to biology.

NEW YORK CITY.

The Unseen World

BY E. E. SPEIGHT

Il est admirable de voir combien les voies de l'âme humaine divergent vers l'inaccessible.—MAETERLINCK.

A MAN of Nippon, I know not who,
Chipped from a tree, I know not where,
A mannikin saint, of pallid hue,
In a shirt of camel's hair.

A sick man smiled to see the toy,
One who had lain uncomfortable;
His heart grew light with sudden joy;
Laughing, he left his bed.

The twist and turn of a carver's thumb,
On willing grain of a willow green,
Had lured a voice from out the dumb,
Life where a log had been.

Henceforth he saw in pillar and post
The soul of possibility,
All day he walked along a coast
Whose waves were mystery.

An elfin clan among the trees,
Treasure beneath the grasping ground.
The voice of angels on the breeze,—
All that he sought he found.

He saw the rolling centuries
In acres of sun-ripened corn;
He loved the dreaming silences
Where melody is born.

He traversed thought from deep to deep,
The world beyond the world was his;
And ever he saw new planets leap
Athwart the dim abyss.

And when at last he came to die,
His one desire lay like a road
That pierced the twilight boundary
Of a long divined abode.

KANAZAWA-KAGA, JAPAN.

The "Titanic" Disaster

BY SYDNEY REID

When temptations fierce assault me,
When my enemies I find,
Sin and guilt, and death and Satan,
All against my soul combined;
Hold me up in mighty waters,
Keep my eyes on things above,
Righteousness, divine Atonement,
Peace, and everlasting Love.

"AUTUMN," a hymn of the Church of England, what we call the Episcopalian Church. That was what the band on the "Titanic" was playing as the "mighty waters" closed over her about 2.20 o'clock (New York time) of the morning of April 15, in latitude 41.46 north and longitude 50.14 west, more than 500 miles from the nearest land. Collision with an iceberg occurred at 11.45 o'clock while the ship was traveling at the rate of 22½ knots an hour.

Slowly sank the great ship, with her band playing, her captain on the bridge, and more than 1,500 human beings aboard her. She had been a thing of wonder and beauty till a few minutes before she went out of sight. Then the chill ocean, invading all her luxurious recesses, extinguished her lights and she showed black to the hundreds of survivors in the boats or floating on life belts as she went under on her way to her last resting place, two miles below.

The "Titanic" was the greatest, largest, finest, most luxurious ship that ever floated since the time when savage man launched his first coracle. Perhaps she was also the fastest. That remained to be seen. Her firemen had orders to make highest speed, and it was generally hoped among her passengers and crew that she would break the steamship record for a western passage.

Warnings of ice ahead had been given by several ships. There were ice mountains in the "Titanic's" path, but what of it? She was "unsinkable." So great was the knowledge and skill and care bestowed on her construction that she was immune to peril. Man had at last triumphed over the winds and the storms, the seas and the icebergs—let come what would the "Titanic" was superior to aught that nature in her maddest mood could do. Says Col. Archibald Gracie:

"In the twenty-four hours ending the 14th, the ship's run was 546 miles, and we were told that the next twenty-four hours would see even a better record posted. No diminution of speed was indicated in the run and the engines kept up their steady running.

"The officers, I am credibly informed, had been advised by wireless from other ships of the presence of icebergs and dangerous flocs in that vicinity. The sea was smooth as glass and the weather was clear, so that it seemed there was no occasion for fear."

The passengers knew that they were among ice before the vessel struck. They felt the warning cold, and some heard that wireless messages from other ships had signaled ice ahead.

"I suppose you are going to slow her down," Mrs. Arthur Ryerson, of Philadelphia, said to J. Bruce Ismay, managing director of the International Marine Company (representing the "Titanic's" owners). She says that Mr. Ismay's reply was:

"Oh, no. On the contrary, we are going to let her run a great deal faster and get out of it."

About 5 p. m. on Sunday evening an ice warning was given, according to Harold J. Bride, the "Titanic's" second wireless operator. He says: "I heard the 'Californian' flashing the ice warn-

ing to the steamship 'Baltic' and I took the message and gave it to the captain."

That was only one of a number of "ice ahead" warnings given the "Titanic" on the fatal Sunday by sister ships. She speeded straight ahead.

There were other warnings when the danger was closer. The weather was clear, a fine starlight night, with the sea smooth as glass. There were men on the lookout in the crow's nest who saw the ice and announced its presence just before the collision. One of these, Frederick Fleet, a seaman who proved a reluctant witness, testified before the Senate committee that he and his mate would have seen the ice in time to avert the disaster if they had been provided with the proper glasses.

"Do you mean to say you had no glasses to assist you in your lookout work in the crow's nest?" Fleet was asked.

"We had no glasses."

"Did you have any at any time on this voyage?"

"We had a pair when the 'Titanic' was coming down from Belfast to Southamp-

ton to take on passengers and cargo. They took them away at Southampton."

"Did you ask for glasses?"

"Yes, sir. They told us there were no glasses for us. Second Officer Lightoller, I was told, would supply us, but he didn't."

"Did you express surprise when told you would not be supplied with glasses?"

"Yes, sir. We always had glasses on lookout on the Oceanic."

Fleet went into the crow's nest with a seaman named Lee at 10 o'clock Sunday night. He and his fellow watchman were warned by the retiring lookouts to keep a sharp eye for ice.

"Soon after seven bells (11:30)," said Fleet, "I saw a black mass of ice ahead. Lee saw it at the same time. I rang three bells, notifying the bridge I wanted to talk through the telephone. I reported the ice ahead. We struck and the ship keeled. We didn't stop until after we had passed the berg."

Bride, the wireless operator, declares that immediately after the collision Captain Smith, of the "Titanic," put his

THE SPACIOUS PROMENADE DECK OF THE ILL-FATED "TITANIC"

head in the wireless cabin and said: "We've struck an iceberg and I'm having an inspection made to tell what it has done for us. You'd better get ready to send out a call for assistance. But don't send it until I tell you."

There was no panic, at least no general panic. Officers and stewards went about reassuring passengers. No harm had been done. Under any circumstances the "Titanic" was unsinkable, and even if in some way she was destroyed there were plenty of boats. Moreover several vessels had answered the wireless call for assistance and were steaming in. There was no danger.

The band played ragtime melodies, card games proceeded in the smoking room.

Then the ship began to list and boats began to be launched. But so well had the theory that the "Titanic" was unsinkable been imprest on the minds of passengers that at first women refused to go in the boats. They would stick to the great, fine ship—it couldn't go down.

Charles Herbert Lightoller, second officer of the "Titanic," tells about filling and lowering the boats. He took charge on the port side and put twenty-four women and children and two sailors in the first boat—it could carry sixty-five persons. In the second boat he put about thirty persons and two sailors; in the third boat about thirty-five and two sailors. When he came to the fourth lifeboat Lightoller said that he ran short of seamen and put in a passenger who said that he was a yachtsman. "He proved himself afterward to be a very brave man," was the second officer's comment. About the fifth boat the witness had no particular recollection. Concerning the sixth he said:

"The last boat I put out, my sixth, we had difficulty finding women. I had called for women and none were on deck. The men began to get in—and then women appeared. As rapidly as they did, the men passengers got out of the boats again."

By the time the last boat was lowered by Lightoller the "Titanic" was rapidly sinking.

"The boat's deck was only ten feet from the water when I lowered the sixth boat. When we lowered the first the distance to the water was seventy feet."

All told, Lightoller testified, 210 members of the crew were saved.

There was good order. "The women and children couldn't have stood quieter if they'd been in church."

The last the second officer of the "Titanic" saw of Captain Smith he was walking the bridge and the last order he heard the captain give was in response to his question as to whether he should put the women and children in the boats. "Yes, and lower away," said the captain.

Lightoller went down with the ship. There were 1,500 people aboard, but no sound of lamentation came from them. They were absolutely braced to meet their icy death. His story of how he came to be saved is one of the most remarkable in the long annals of the sea:

"I was sucked against a blower and held there."

"Head above water?"

"No, sir. A terrific gust came up the blower—the boilers must have exploded—and I was blown clear."

"How far were you blown?"

"Barely clear. I was sucked down again; this time on the 'fidley' grating."

"Did any one else have a similar experience?"

"Yes, Col. Gracie."

"How did you get loose?"

"I don't know; maybe another explosion. All I know is we came up by a boat."

"What other officers besides yourself survived?"

"The third, fourth and fifth officers, sir," he replied and gave their names.

Arthur Godfrey Peuchen, manufacturing chemist of Toronto, Canada, and major of Toronto's crack regiment, the Queen's Own Rifles, was the "very brave man" whom Lightoller put in the fourth boat to take the place of a sailor. He voluntarily returned from Toronto to aid the Senate committee by his testimony.

"On Sunday evening," he said, "I dined with my friends. We were all in the highest spirits and best of health. After the dinner was over we adjourned to one of the cabins, where we made coffee and had a good time laughing and joking. I retired to my stateroom and had just reached there when I felt a jar as tho a big wave had struck the ship."

He went on deck and saw a deal of ice that looked like shell ice. The ship had struck an iceberg, but he did not think the blow was serious. A little later, tho, he noticed that the ship was listing. That

looked serious, but his friend, Mr. Hays, laughed and said, "Oh, she is good anyway for eight or ten hours. You can't sink this boat no matter what she struck." But Major Peuchen was not so sure and the other passengers showed signs of worry, some of the ladies crying. He heard the order for lifeboats, and going to his stateroom changed his evening dress for heavy clothes and put on a life preserver. Then he went up to the boat deck and watched the boats getting ready. The boats were loaded with women and children, with sailors to take care of them. Finally came a time when there were no more sailors and the major offered himself and was accepted. The quartermaster was in charge of this boat. Peuchen took an oar. They rowed away from the ship and tho there was a whistle apparently summoning them to return, the quartermaster forbade it. "It is our lives now and not theirs," he declared. The witness went on:

"Then we began to hear signs of the breaking up of the 'Titanic.' We heard a sort of a call for help after the whistle; then a rum-

bling sound. I think the 'Titanic's' lights were still on. Then there was an explosion, then another. Then the lights went out, and then came those dreadful cries.

"They frightfully affected all the women in our boat. At first it was horrible to listen to, but the sounds grew fainter and fainter. I think we were about five-eighths of a mile away."

He did not see the vessel sink, but his theory was that the explosions were above water, caused by the heavy pressure when the boat started to dive down by the head.

"How many explosions were there?" asked Senator Smith.

"About three, I think; but I was excited."

The women in the boat behaved splendidly. The witness thought that it was some of them (whose husbands had been left on the vessel) who wanted to turn back in response to the whistle. They helped to row the boat.

The major agreed with Fleet that if the lookout had been provided with glasses the ship might have been saved from the collision. He declared: "I do not criticise Captain Smith, but I do crit-

AT SOUTHAMPTON THE GIANT "TITANIC" NARROWLY AVERTED A COLLISION WITH THE STEAMSHIP "NEW YORK" (ON THE LEFT) WHEN SETTING OUT ON HER MAIDEN VOYAGE

icise the policy or methods pursued by the company, for I feel sure that in this case caution would have averted a terrible calamity."

The evidence thus far adduced shows:

1. That the "Titanic" was going at high speed when she struck the berg.
2. That no attention had been paid to repeated ice warnings.
3. That at the utmost the boats could hold no more than 1,200 persons.
4. That several of them were sent away not more than half full.
5. That the boats had no provisions or water aboard.
6. That the boats were not easily accessible or easy to launch.
7. That officers and crew were new to each other. There had been no "shake down" trip.
8. That there were not enough life preservers.

In a word the loss of the ship seems to have been the result of extraordinary recklessness, founded on the theory that the ship really was "unsinkable" and could afford to hit at full speed anything, berg or derelict, to be found in the waters over which she was traveling.

The "unsinkable" theory and the fact that "the others all do it" account for the shortage of boats and preservers. The company took chances once too often.

Splendid hero and heroine stories come from the wreck. Great men and women who make human beings proud of their race stood revealed when death inexorable and in dreadful form confronted the company.

Strict discipline prevailed and the grand old rule of the sea, "women and children first." It was hard when women were separated from their husbands, but it was right and just and fair—and it was firmly adhered to.

But some of the women rebelled. Mrs. Straus climbed back out of a boat and said, "I will not go unless my husband goes with me." She stayed and died.

"You have children, I have none; take my place," said a young woman, giving up her seat in a boat and accepting death on the ship.

"Why don't you put on a life belt?" one of the women asked a steward, and the humble reply was: "Well, ma'am, I

was afraid that there might not be enough to go around."

Astor and Butt, courteous, smiling, cool, steady, helping the women "as if they were at a ball." Going into the open jaws of death with never a blanching. Astor put his bride in a boat and (she being ill) requested permission to attend her for her protection. The second officer, who was in charge, replied:

"No, sir. Not a man shall go on a boat until the women are all off."

Colonel Astor threw a kiss to his wife, saluted the second officer and turned to the work of helping and reassuring the other nervous women.

Frank Millet, the artist, was on deck helping the women, and buttoned up their dresses.

Great hearted gentlemen, and ladies, too, went down with the greatest ship. Weak and fearful souls there were, but the grand and brave and beautiful predominated and prevailed.

The effect of the disaster has been to arouse the maritime world and the governments of civilized nations. Our own Senate acted instantly, moved so fast that they caught all the material witnesses and are obtaining full illumination of the facts. Great Britain is waiting somewhat impatiently till she can get at the same witnesses. She is to hold her own investigation. France has announced that her liners are safe—that they carry enough boats. Germany has given her sister nations a sort of general scolding after the text "Be more careful." There has been a scramble among ocean liners to equip themselves with more boats. One of the "Olympic's" stokers at Southampton criticised a "new" boat. His criticism took the form of an exploratory kick. The kick stove in the entire side of the "new" boat and the stokers went on strike. So the "Olympic" lies at her pier.

The whole world is awake and knows why the "Titanic" went down. It wasn't by reason of any dispensation of Providence, but by reason of human greed and recklessness. Humanity sinned and must now repent and perform "works meet for repentance."

The outlook is that the loss of the "Titanic" will render ocean travel safer.

Man the Life-Boat!

BY JAMES H. WILLIAMS

[Mr. Williams, as our readers well know, is an able seaman who has all his life followed the sea. He says in his youth they had wooden ships and iron men, but now they have iron ships and wooden men. Mr. Williams is no wooden man.—EDITOR.]

NOW while the Senatorial inquiry concerning the "Titanic" disaster is on and the public mind is aroused to something like an adequate realization of maritime necessities, a few practical suggestions from an unpretentious sailor-man may not be out of place.

No doubt as a result of this special inquiry, and in view of this latest and gravest of historical sea tragedies, many new and much-needed rules and regulations governing the equipment and practice of passenger ships will be speedily promulgated and enforced.

Above all, the number of life-boats and life-saving appliances generally will be largely increased, and ample provision made for the accommodation of all on board, including passengers and crew, in case a get-away becomes necessary.

All this is wise and well and should be done at once. But after the life-boats—what? Among all the clamor for more boats and life-saving apparatus I hear very little as to who is to handle them after they have been provided.

In case of future marine disasters, such as are liable at any time to occur, must the management of the boats and the safety of hundreds of human lives be left to the host of untrained and incapable cooks, stewards, waiters, stokers and Liverpool shoe-blacks who constitute about ninety per cent. of every liner's crew?

In an open boat in the open sea, dear traveler, will you trust your rescue to the hands of such as these?

Yet, such in the main constituted the crew of the recent "Titanic," mistress of

THE HURRICANE DECK OF THE "CARPATHIA" AS IT APPEARED AFTER TAKING ON SOME OF THE "TITANIC'S" LIFE-BOATS

the seas for a few days and matron of the depths for evermore. For, altho a new ship, she was no departure from the usual rule; less than ten per cent. of the crews on ocean liners are practical sailors, and of those actually rated as "A. B.'s" (able-bodied) on the ship's articles less than one-third are, as a rule, able seamen in fact.

No steamer ever made a sailor. As a matter of fact, the crews of ocean liners are usually enlisted on the supposition that nothing is going to happen; therefore, any man who can swab paint and holystone decks will do.

Now that the "unsinkable" theory has been so fearfully exploded perhaps there may be an inning for the Man Jack to justify his usefulness and dignify his time-honored calling.

In these respects, at least, the survivors of the "Titanic" were extremely fortunate: They had fine weather and a smooth sea to facilitate their getaway from the sinking ship, and a rescuing ship was close at hand. Had it been otherwise the toll of Death must have been even greater than it was, if indeed any could have escaped. For it appears from the reports that most of the boats were mishandled and, as to equipment, some were ill-found.

The "Titanic," like all other first-class ships of her line, flew the blue ensign of the Royal Naval Reserve, signifying that a certain percentage of her crew belonged to the Royal Naval Militia. This fact does not, however, tend to elevate the nautical practice or naval standing of her crew one iota except in the eyes of an easy-to-be-beguiled public, and is useful only for dress parade and advertising purposes.

Naval Reserve men are usually given the first preference in selecting crews for ocean liners; but this does not distinguish them as being first-class seamen. Some of them are so, but they are sadly in the minority.

I have sailed with many of them and know whereof I speak. As seamen they are perfectly useless, while as boatmen they are positively dangerous.

About one year and a half ago I was shipmate with a British boatswain who has sailed for years in both the White

Star and Cunard lines. He told me that on one occasion, when a new crew was mustered on board one of the White Star ships at Liverpool, the chief officer ordered: "All you Naval Reserve men who have never been to sea before stand over." In response to this order, ninety men left the line and shambled over to starboard as an acknowledgment that they had never been to sea. Yet they were all rated as *seamen*!

Judging from my own more limited experience with this class of recruits, I see no reason to doubt my shipmate's statement.

Now that new legislation on the subject of life-boats, et cetera, seems certain, would it not be wise and prudent to embody within the text of the proposed laws some special provision for the equipment and management of the same?

For the past ten years there has been pending in the United States Congress a bill embodying the views of the organized seamen of this country regarding much-needed maritime reforms. The most important clause of this bill which has so far failed of enactment is a provision designed to regulate the number and individual efficiency of the deck crews, or "able seamen," to be carried in every ship.

This clause, or something similar, should be made a part of any regulations to be enacted for the safety of life at sea.

If they grant us life-boats, we should inquire, "How about the man at the oar?" A true sailor is born with an oar in his fist. His knowledge of boatmanship is an inward sense, developed and perfected by external physical practice.

Far from fearing the wind and sea, he often utilizes their power to his own purposes. He trims his sheets, and boards his tacks on the weather roll, and tautens his braces when the ship "sends aft." In all his actions he cheats the wind and sea, and handles a twenty-foot steering oar with as much grace and dexterity and sureness of stroke as a musician does a fiddle-bow.

Such men are seldom to be found in liners, however, and any legislation look-

ing toward safer traveling facilities for the general public is apt to prove false in practice unless it embodies special provision for the practical efficiency of able seamen and the selection of special life-boat crews on all ocean liners.

All the men engaged in our coastwise life-saving service are selected by the department for their *known* ability and courage as seamen, surfmen, deep-sea fishermen and whalers, and just consider their splendid, their unbroken and heroic record during the past thirty years!

Can we not compel the steamship companies to do by law what our Government does so generously, so wisely and successfully, without compulsion: employ competent men for this most important of all manly duties, the saving of human life?

Every ocean liner should be required by law to carry, in addition to the regular crew of roustabouts and paint-swabbers, a specially selected life-saving crew, composed of practical sailors and boatmen of *known* (not certified) ability and experience. These men should be ap-

pointed at least two to each boat, and given full charge of the boat-deck and all life-saving appliances of whatsoever kind. They should be under the general supervision of a practical deep-water boatswain, whose duty it should be to see that every boat and raft is at all times ready for immediate service; that the davit tackles are always clear for running and that every item of equipment belonging to each boat is in perfect condition and in its proper place. The life-saving crew should be divided into two watches and kept on duty day and night, ready for any emergency that may arise. Patent boat cranes should be installed in all passenger boats instead of the obsolete davits in present use. These cranes do not have to be turned in order to get the boat swung over, and in lowering they can be "stooped" to such an angle as to give the boat a fair offing from the ship's side when it strikes the water, thus minimizing the danger of being stove.

All davit tackles should be provided with patent self-releasing hooks, which

THE "TITANIC'S" LIFE-BOATS TIED UP AT THE NEW YORK PIER AFTER THE "CARPATHIA'S" RETURN

will disengage themselves automatically when the boat touches the water.

Every life-boat should be fitted with an extra heavy rowlock or a grooved scull hole in the stern, to one side of the rudder head, for the reception of a steering oar.

In leaving a ship's side in heavy weather, one sweep of a twenty foot steering oar in skilful hands will sometimes work wonders for mortal salvation when a rudder would be absolutely useless.

In the winter season no life-boat

show that even with more life-boats some other improvements will still be lacking.

In order to encourage good boatmanship and promote class interest in their work among the life-saving crews of these ships, I think a permanent trophy should be offered in New York, for the possession of which boat crews of rival liners might contend in periodical regattas.

This would surely tend to stimulate a desire to excel in the management of life-boats and the manipulation of their equipment and attachments, and would

A TEST OF THE "KAISER WILHELM II'S" LIFE-BOATS AT HOBOKEN BEFORE THE SHIP LEFT PORT LAST WEEK—STEWARDESSES PLAYING THE PART OF PASSENGERS

should be allowed to carry more than two-thirds of its maximum quota of passengers, and the number of life-boats per ship should be founded on this rule. Moreover, each life-boat should be provided with a suitable locker, filled with heavy wraps and light-weight tarpaulin cloths to protect female passengers and children from the rigors of the weather.

Many other details that might make for safety and assurance of passengers might be suggested, but I think these will

promote public interest in the work and welfare of the crews themselves as well, and this will count for much when it comes to life-saving.

Let all good citizens, therefore, demand immediate and favorable action on the manning and efficiency clauses of the seamen's bills now pending in Congress and for many years continually sidetracked from session to session at the arrogant behest of sordid shipowners.

Death steers the mismanned boat!

NEW YORK CITY.

Telling the Tale of the "Titanic"

BY ALEX. McD. STODDART

ASSISTANT CITY EDITOR OF THE NEW YORK PRESS.

AT 1.20 a. m., Monday, April 15, the cable editor opened an envelope of the Associated Press that had stamped on its face "Bulletin." This is what he read:

"Cape Race, N. F., Sunday night, April 14.—At 10.25 o'clock tonight the White Star Line steamship 'Titanic' called 'C. Q. D.' to the Marconi station here, and reported having struck an iceberg. The steamer said that immediate assistance was required."

The cable editor looked at his watch. It was 1.20 and lacked just five minutes of the hour when the mail edition goes to press.

"Boy!" he called sharply.

An office boy was at his side in a moment.

"Send this upstairs; tell them the head is to come; double column and tell the night editor to rip open two columns on the first page for a one-stick dispatch of the 'Titanic' striking an iceberg and sinking."

Every one in the office was astir in a moment and came over to see the cable editor write on a sheet of copy paper: Set across two columns.

"Titanic Sinking
in Mid-Ocean; Hit
Great Iceberg."

"Boy!" he called again; but it was not necessary—a boy in a newspaper office knows news the first time he sees it.

"Tell them that's the head for the 'Titanic.'"

Then he wrote briefly this telegraphic dispatch, and as he did so he said to another office boy at his side: "Tell the operator to shut off that story he is taking and get me a clear wire to Montreal."

This is what he wrote to the Montreal correspondent, probably at work at his desk in a Montreal newspaper office at that hour:

"Cape Race says White Star Liner 'Titanic' struck iceberg, is sinking and wants immediate assistance. Rush every line you can get. We will hold open for you until 3.30."

"Give that to the operator and find out

if we caught the mail on that 'Titanic' dispatch," he said quickly to the boy.

In a moment the boy returned.

"O. K. on both," he said.

These night office boys can carry a message to Garcia.

The city editor, who had just put on his coat previous to going away for the night, took it off. The night city editor, at the head of the copy desk, where all the local copy (as a reporter's story is called), and the telegraph editor stood together, joined later by the night editor, for the mail edition had left the composing room for the stereotypers and then to the pressroom, and from thence to be scattered wherever on the globe newspapers find readers.

The "Titanic" staff was immediately organized, for at that hour most of the staff were still at work. The city editor took the helm.

"Get the papers for April 11—all of them," he said to the head office boy, "and then send word to the art department to quit everything to make three cuts, which I shall send right down."

Then to the night city editor: "Get up a story of the vessel itself; some of the stuff they sent us the other day we did not use and I ordered it put in the envelope. (Morgue, obituary, call it what you will, are cabinets that contain envelopes filled with newspaper, magazine and other clippings on every conceivable subject, alphabetically arranged for immediate call.) Play up her mishap at the start. Get up a passenger list story and an obituary of Smith, her commander."

There was no mention of Smith in the dispatch, but city editors retain such things in their heads for immediate use, and this probably explains in a measure why they hold down their jobs; also having, it might be added, executive judgment, which is sometimes right.

"Assign somebody to the White Star Line and see what they've got."

The night city editor went back to the circular table where the seven or eight men who read the reporters' copy were gathered.

"Get up as much as you can of the passenger list of the 'Titanic.' She's sinking off Newfoundland," he said briefly to one.

And to another: "Write me a story of the 'Titanic,' the new White Star liner, on her maiden trip, telling of her mishap with the 'New York' at the start."

And to another: "Write me a story of Captain E. J. Smith."

Then to a reporter, sitting idly about: "Get your hat and coat quick; go down to the White Star Line office and telephone all you can get about the 'Titanic' sinking off Newfoundland."

Then to another reporter: "Get the White Star Line on the 'phone and find

out what they have got of the sinking of the 'Titanic.' Find out who is the executive head in New York, his address and his telephone number."

And in another part of the room the city editor was saying to the office boys: "Get me all the 'Titanic' pictures you have and a photo or cut of Captain E. J. Smith."

Two boys instantly went to work, for the photos of men are kept separate from the photographs of inanimate things. The city editor selected three:

"Tell the art department to make a three-column cut of the 'Titanic,' a two-column of the interior, and a two-column of Smith."

In the meantime the Associated Press bulletins came in briefly. Stripped of their date lines they read:

Half an hour afterward another message came, reporting that they were sinking by the head and that women were being put off in the life-boats.

The weather was calm and clear, the "Titanic's" wireless operator reported, and gave the position of the vessel as 41.46 north latitude and 50.14 west longitude.

The Marconi station at Cape Race notified the Allan liner "Virginian," the captain of which immediately advised that he was proceeding to the scene of the disaster.

The "Virginian" at midnight was about 170 miles distant from the "Titanic" and expected to reach that vessel about 10 a. m. Monday.

2 a. m. Monday.—The "Olympic" at an early hour this (Monday) morning was in latitude 40.32 north and longitude 61.18 west. She was in direct communication with the "Titanic," and is now making all haste toward her.

The steamship "Baltic" also reported herself about 200 miles east of the "Titanic" and was making all possible speed toward her.

The last signals from the "Titanic" were heard by the "Virginian" at 12.27 a. m.

The wireless operator on the "Virginian" says these signals were blurred and ended abruptly.

Paragraph by paragraph the cable editor was sending the story to the composing room. What was going on upstairs every one knew. They were side-tracking everything else and the copy-cutter in the composing room was sending out the story in "takes," as they are called, of a single paragraph to each compositor. His blue pencil marked each individual piece of copy with a letter and number, so that when the dozen or so men setting up the story had their work

HOWARD COTTAM

The "Carpathia's" young wireless operator, at the door of his wireless station

finished the story might be put together consecutively.

"Tell the operator," said the cable editor again to the office boy, "to duplicate that dispatch I gave him to our Halifax man. Get his name out of the correspondents' book."

"Who wrote that story of the 'Carmania' in the Icefield?" said the night city editor to the copy reader who "handled" the homecoming of the "Carmania," which arrived Sunday night, and the story of which was already in the mail edition of the paper before him. The copy reader told him. He called the reporter to his desk.

"Take that story," said the night city editor, "and give us a column on it. Don't rewrite the story. Add paragraphs here and there to show the vast extent of the ice field. Make it straight copy, so that nothing in that story will have to be reset. You have just thirty minutes to catch the edition. Write it in twenty."

"Get the passenger lists of the 'Olympic' and the 'Baltic'" was the assignment given to another reporter, all alert waiting for their names to be called, every man awake at the switch.

In the meantime the story from the Montreal man was being ticked off, and on another wire Halifax was coming to life.

"Men," said the city editor, "we have just five minutes left to make the city. Jam it down tight."

Already the three cuts had been made, the telegraph editor was handling the Montreal story, his assistant the Halifax end, and the cable editor was still editing the Associated Press bulletins and writing a new head to tell the rest of the story the additional details brought. The White Star Line man had a list of names of passengers of the "Titanic" and found that they numbered 1,300 and carried a crew of 860.

In the meantime the proofs of all the "Titanic" matter that had been set were coming to the desk of the managing editor, in charge over all, but giving his special attention to the editorial matter. All his suggestions went thru the city editor and on down the line, but he himself went from desk to desk overlooking the work.

"Time's up," said the city editor, but

CAPTAIN ROSTROM OF THE "CARPATHIA"

before he finished the cable editor cried to the boy: "Let the two-column head stand and tell them to add this head":

"Titanic" Sinking
in Mid-ocean; hit
Great Iceberg.

And to this was added:

At 12.27 this Morning Blurred Signals by Wireless Told of Women Being Put Off in Lifeboats—Three Liners Rushing to Aid of 1,300 Imperiled Passengers and Crew of 860 Men.

"Did we catch it?" asked the cable editor of the boy standing at the composing room tube:

"We did," he said, triumphantly.

"One big pull for the last, men," said the city editor. "We're going in at 3.20. Let's beat the town with a complete paper."

The enthusiasm was catching fire. Thruout the office it was a bedlam of

noise—clicking typewriters, clicking telegraph instruments and telephone bells ringing added to the whistle of the tubes that lead from the city room to the composing room, the press room, the stereo-type room and the business office, the latter, happily, not in use. But thruout the office men worked; nobody shouted, no one lost his head, men were flushed, but the cool, calm, deliberate way in which the managing editor smoked his cigar helped much to relieve the tension.

"Three-fifteen, men," said the city editor, admonishingly. "Every line must be up by 3.20. Five minutes more."

The city editor walked rapidly from desk to desk.

"All up," said the night city editor, 'and three minutes to the good.'

At the big table stood the city editor, cable editor, night city editor and managing editor. They were looking over the completed headline that should tell the story to the world. It read:

Across three columns.

New Liner "Titanic" Hits An Iceberg;

Sinking by the Bow at Midnight;

Women Put off in Lifeboats;

Last Wireless at 12.27 a. m. Blurred.

Single column.

Allan Liner "Virginian"

Now Speeding Toward
the Big Ship.

"Baltic" to the Rescue, Too.
The "Olympic" Also Rushing to
Give Aid—Other Ships
Within Call.

"Carmania" Dodged Bergs.
Reports French Liner "Niagara"
Injured and Several Ships
Caught.

Big "Titanic's" First Trip. Bringing Many
Prominent Americans, and Was Due
in New York Tomorrow.

Mishap at very Start. Narrowly Escaped
Collision with the American Liner
"New York" when Leaving Port.

"That will hold 'em, I guess," said the city editor, and the head went upstairs.

The men waited about and talked and smoked. Bulletins came in, but with no important details. Going to press at 3.20 meant a wide circulation. At 4.30 the Associated Press sent "Good-night," but at that hour the presses had been running uninterruptedly for almost an hour.

On Monday morning, at 12 o'clock, the city editor was at his desk half an hour earlier than usual. His assistant already had read the morning papers and the first editions of the afternoon papers, known as the "bulldog edition," which is really the morning papers rewritten, with just a new angle on the news. In a poker way, the "bulldog" goes the morning paper one better.

"We got out a corker this morning," said the assistant city editor, altho he himself had been fast asleep and knew nothing and did nothing until he picked up his morning paper at the railway station, for assistant city editors, having day jobs, can live in the suburbs. But before noon the assistant city editor had dug out of the morning papers such events as would take place during the day as the city editor might care to "cover," the "beats" the other papers had, the treatment of a story that was so different from the others as the city editor might be interested in, and anything that might interest him generally, all of the clippings clasped together and the schedule neatly typewritten telling in a line the time, the place and the thing.

As he handed it over he remarked to his chief: "Practically nothing new on the disaster; all the passengers were taken off in lifeboats and are now on their way to Halifax, says Franklin, of the White Star Line. By the way, I had a letter from Hitchens today. He's at St. John's. Don't you think it would be a good plan to send him over to Halifax even if it does break up his vacation?"

"Yes; and tell him to get a private wire when he reaches there."

"Get this off quick," he said, and he handed the following telegrams to his assistant. "Better have the boy take them to the Marconi Wireless himself—27 William street," he added.

These were the Marconigrams—in duplicate to W. T. Stead, Major Archibald Butt and Jacques Futrelle:

"Please send wireless exclusive "Titanic" sinking; your own rates."

It was signed by different names, not by the paper, because these men were known to the individuals and were friends. To Butt's telegram was left off "Your own rates" and it was signed by

the name of the Washington correspondent, a personal friend of many years' standing.

"Skipper wants to talk to you," said the assistant to the city editor, and he pushed the bracket 'phone that both used toward his chief. "Skipper" is the title in this office, and usually in all other offices, that is given to the ship news man.

"He says Franklin is not telling the truth, he believes, about the 'Titanic.' Write this name and address down," said the city editor, "and rush this dispatch":

"Can you get me the truth, for private information, about the 'Titanic.'"

The dispatch was sent to the head of one of Canada's great railways.

Meanwhile the city editor was perusing the schedule of suggestions of his assistant, to which he added his own, in more terse language. This is what it looked like:

Scenes at White Star Office.....Burnet
 Passenger ListHoward
 First Steamer to Use Wireless.....Horry
 Cape Race a Graveyard.....Wall
 Description of "Titanic"Lynah

"Titanic" Accident Insurance and Losses

Glover
 Noted Men and Women on Board...Griffen
 Skippers Warned of Ice Peril.....Bush
 Career of Captain Smith.....Payne
 How the "Republic" Sank Off No Man's Land

Kimpton
 Careers of Millet, Harris, Ismay, Butt, Stead,
 Futrelle, Strauss, Astor, Hays, Guggenheim
 and MooreBrewster

Northern Ice Packs Break up Early

Elmendorf
 Arctic Glaciers the Cause.....Whitten
 Bulkheads at FaultMoors
 Liners That Have Paid Toll.....Bromiley
 Modern Safety DevicesMcDonald

And so the morning work was started.

The other local news, however, must not be neglected, and there was no disappointment when, in looking over the assignment book, it was found that, at least for the present, the following men were out of it:

Hoe Book SaleWilson

BROADWAY, BY THE WHITE STAR LINE OFFICES, CROWDED WITH THE STRICKEN AND THE CURIOUS

And so the staff separated, all to turn in by 5 o'clock, when the copy readers should begin their work, the stories assigned to them earlier in the day. The organization must never go to pieces, no matter how big the news; the paper must always take care of the other news, no matter how greatly it is overshadowed.

"My God!" said the city editor, as he read a dispatch at 7 o'clock that night, "the skipper's right. The White Star Line and Franklin have lied to us."

"Here," he said, calling to Burnet to come to his desk, "go back to the White Star Line and tell Franklin he is a liar! The 'Titanic' sank at 2.20 this morning and not more than 700 were taken off in the boats. Tell it to him with my compliments, too."

Every one looked up, for the voice of the city editor was pitched high and he was angry clear thru. "Here's a private dispatch," he said, "I have just received from a friend in Canada, who says that the 'Titanic' went down at 2.20 and the only ones saved are practically women and children."

And then was begun the story telling the world Tuesday morning of the "Titanic" sinking four hours after hitting an iceberg, 866 being rescued by the "Carpathia," with probably 1,250 perishing in the sea; with Ismay safe, and probably Butt, Astor, Smith, Stead, Guggenheim, Millet, Harris, Futrelle, Straus and others less prominent sinking with the "Titanic."

When the city editor arrived on Tuesday morning, again at noon, showing practically no wear of the eighteen-hour stretch he had gone thru, he recalled Hitchens, now in Halifax, telling him to "never mind" and proceed on his vacation, etc., for the "Carpathia," "the hospital ship," was bound for New York where everything would center.

No reply came from Butt, Stead or Futrelle. Naturally. But what bothered the city editor was that the offer made by wireless to the wireless man aboard the "Carpathia" brought no response, not a word came in answer to the message to Captain Rostrom, of the "Carpathia," not a word from any passenger of the three women who, it had

been suggested to him, might be able "to write the story."

The ship news man was sent early to find out about the "Carpathia," when she would arrive, what men would board her, what and when the revenue cutter would leave, how many men each paper might be permitted to have on board, and arrangements on the pier. This, some of it for publication and some of it for office information, was hard to get because "everything up in the air," he reported. Tuesday brought by wireless the passenger list, but not a scrap of information. Nevertheless there were half a dozen pages to fill, and this is the way the city editor mapped out his story for certain things were evident: That the "Titanic" knew of the ice ahead (because she was warned by the "America"); Astor, Straus, Stead and Butt were given up for lost; there were not enough lifeboats; the "Titanic" was not "unsinkable"; these were "leads," and so the staff got busy again.

There were the old stories to be covered again: the scenes at the White Star Line offices, "Titanic" accident, and life insurance of men and women lost, and these additional stories that the news reports suggested: Criticism of the northern route; young Astor to send ship to seek his father; customs men to pass the "Carpathia" without delay; American regulations compared with British regulations as to lifeboat capacity; big Atlantic liners that are now lacking in lifeboats; sea patrol suggested for the ice region; vessels not built that will not sink; scout cruisers rushed to scene of wreck; care of survivors when they arrive; steerage survivors to find aid; sea traffic not hurt by the disaster; facts about those on the "Titanic"; people from afar off coming to New York; Congress likely to say "more lifeboats"; triumph for wireless and why was false news given out Monday night, when it was known that the "Titanic" foundered at 2.20 a. m. Monday.

Tuesday midnight came. This query was handed to the city editor:

"Have story that wreck was caused by high speed and panic," wired St. John correspondent. "Shall I send?"

"Wire 'Let it come,'" said the city editor.

Five hundred words came. The city editor read it carefully, balanced it in the scales, as it were, and then, reluctantly, as if still in doubt, he said to the telegraph editor:

"Doublelead it; across two columns; put a four-column head on it and say in the head that the tale is discredited."

The city editor was taking no chances. And so Wednesday morning brought six, seven and eight pages of the "Titanic" matter when the only news was the list of passengers reported by wireless.

Wednesday—another day with no news and with the plan of many engaged to thwart the newspapers and keep what news of the disaster they could from leaking out. The "Carpathia," it was figured, would be in late Thursday night or possibly Friday morning. Absolutely no news was received, even her position being six, eight and ten hours behind. It was definitely stated, however, that no newspaper man would be permitted to board the vessel on her way up New York Bay, or at her pier in the Hudson River. Quick work was required and the aid of President Taft, Mayor Gaynor and Secretary McVeagh was sought both by the newspapers and those desiring to stop publicity. The newspapers won, and Secretary Nagel received instructions from the President to see that at least reporters were permitted to tell the world what had happened. Every newspaper would have been glad to have assigned twenty-four reporters to interview survivors, but at last it was decided that the press associations should be represented by six men each, the morning newspapers by four men each, and the evening newspapers by two men each. Photographers were barred. Admission to the pier only was given. Previous to this newspapers were given a number of pier passes; these, however, were canceled, and special tickets of the number quoted were to take their place.

How Thursday's paper was got out is merely a repetition of Tuesday. The great story was Thursday night, when the "Carpathia" should arrive. For the "Carpathia" absolutely refused to give out anything by wireless which should tell

Photo by Clinedinst, Washington

SENATOR W. A. SMITH

Chairman of the committee investigating the "Titanic" disaster, on the steps of the Senate Office Building, on the morning of one of last week's sessions

in advance what had happened on that Sunday midnight and when 1,595 men, women and children perished off Newfoundland. The whole of America wanted to know, the whole civilized world wanted information, but this is what the Associated Press had to send to its clients, the newspapers of America:

"We have no assurance that we will get any wireless news from the 'Carpathia,' as this vessel studiously refuses to answer all queries. Even President Taft's requests for information, addressed to the 'Carpathia,' has been ignored."

How the city editor laid his plans to get the "Carpathia's" story of the "Titanic" disaster, with only four men to go on the pier, is interesting. First, as near to the pier as he could get it, he arranged for four private wires, direct wires, that would lead into the editorial rooms. These four wires were for the four men, the main men on whom he depended to get the great story of the "Titanic's" foundering. They were picked men, no better, probably, than the rest, but luck

is always on the side of the man who is a worker and is alert. In the office were four men, with typewriters, with an instrument held in place to the ear. Whether the "Carpathia" got in at 9 o'clock, or 10, or 11, or 12, or even 1, the story would, must, be told. Time alone would give more opportunity as to whether the story could be told in two, four, six, eight, ten or twelve pages. The "Carpathia" docked at 9.35 o'clock, but that is getting ahead of the story.

Where the four private telephones were installed was the headquarters of the staff. Two blocks away, out of the way of the great crowd that should gather, were automobiles stationed to carry men to the office, the men who should write the advance stories of the crowds, the ambulances and other aid, the scenes on the pier, before the "Carpathia" came in.

The moment the "Carpathia" docked the real story would begin. Before 6 o'clock that night the four pier passes were distributed to the four men selected; the additional pier passes that were said to be of no use were also passed out, and in addition every member of the staff had his police card, which permits the reporter to go within the police lines.

At 6 o'clock that night sixteen men gathered around the city editor. By telephone or otherwise the men who were to gather the story were told to report promptly. They did. These sixteen men were the flying squadron, upon whom devolved the great task of the night. Outside the group, as it were, was the managing editor, who ordinarily is in entire charge of the paper. The night city editor, who is at the head of men who edit the reporters' copy, was near him. And near by were the telegraph and cable editors, whose "Titanic" work was practically finished, their work having been done on the nights when news really did come. Near by stood the four men who were assigned to take the stories over the telephone and write them on the typewriting machines. Other members of the staff stood by to hear how "the chief," as the city editor is sometimes called, intended to outline the story.

He began in a leisurely tone, as if telling a story. And this is what he said:

"When the 'Carpathia' docks tonight which, as closely as I can figure it, will

be between 9 and 9.15, there will probably be thirty thousand people held back by the police. The arrangements may go to pieces; but I imagine Waldo's men will not let the crowd break loose. But whatever happens, you will be up against a stiff game to get thru the lines. We have established four telephones, which are direct wires between this office and the building on the northeast corner of Fourteenth street and Eleventh avenue.

"The four special passes which I have already given out will admit within the pier lines. The pier passes, which the customs people say now are not good, I have already given out. You may be able to break thru lines here and there, but at any rate your police cards will be recognized. As you know, the main story is the arrival of the 'Carpathia,' and the tales told by survivors and passengers who witnessed the rescues. The men with the special pier passes will get the story of the four officers who were saved and particularly the story of the second Marconi operator who came thru alive. It may be another Jack Binns story and it may not, but we've got to get it. Also the story of the wireless operator of the "Carpathia" must be had. These men ought to have thrilling stories. Captain Rostrom's story should tell from the time he turned his vessel toward the 'Titanic' till he reached the pier. Bruce Ismay must be seen. He will give out a formal statement. It won't be worth the paper it is written on, but we'll print whatever he says. Ask him how he came to be saved when Astor, Butt, Straus and Guggenheim went down. That's the story we want—no statement.

"Mr. Burnet will see the second Marconi wireless man; and, if possible, the first officer.

"Mr. Howard will see the wireless man of the 'Carpathia' and if possible the second officer.

"Mr. Horry will see Ismay and the third officer, if possible.

"Mr. Wall will see Captain Rostrom and incidentally ask him why Taft's message was ignored.

"In charge of the story will be Mr. Burnet; you may have to ignore some of these assignments; you men on the ground will be the better judge. If you want me, I'll be right here at my telephone."

All the men were listening intently, for an unusual scene like this is rarely witnessed in a newspaper office.

"You four men upon whom I am depending for the main story will see as many survivors as you can; get as many stories as you can and don't be afraid of duplicating. I'll take care of that.

"Every man will get survivors' stories; I repeat, don't be afraid of duplicating. I'll take care of that.

"Mr. Lynah will write the story on the arrival of the ship on the pier and interviews with survivors.

"Mr. Glover will write the story of the Senate committee that is on its way here, and which will arrive at 8 o'clock, and interviews with survivors.

"Mr. Griffen will write the story of the tugs that will go out to intercept the 'Carpathia' and interviews.

"Mr. Bush will write the story of the relief extended to survivors and get interviews.

"Mr. Payne will write the story of the crowd at the Battery and then follow the boat to the pier and get interviews.

"Mr. Kimpton will write the story of the distribution of the money sent by the stock exchange, and get interviews.

"Mr. Brewster will write the story of the autos and get interviews.

"Mr. Elmendorf will get the story of the crowds that will not get near the scene, and get interviews.

"Mr. Whitten will see Franklin and get what the White Star Line has to say, and get interviews.

"Mr. Moors will get interviews and then cover the hotels on Broadway between Twenty-seventh street and Thirty-fourth street.

"Mr. Bromiley will get interviews and cover the hotels between Thirty-fourth street and Forty-fifth street.

"Mr. McDonald will get interviews and cover the Fifth avenue hotels, from the Holland House to the Plaza, and including the Ritz-Carlton.

"The autos for the men who are doing these hotels will be parked at Eighteenth street and Eleventh avenue. The chauffeurs of these machines will have a piece of white paper in their hats and will take instructions from any man who presents his police card. Mr. Payne, who will do the Battery first, will find his machine at the door.

"In getting the story of survivors and of those on the 'Carpathia' to whom the survivors told their story, find out how Astor, Stead, Straus, Millet, Harris, Butt, Futrelle, Guggenheim and Smith died. Get every one to tell any story of heroism or cowardice he or she witnessed. Find out how the crew acted and the panic in the steerage, if there was one.

"The men who do the theaters will first send their stories over the telephone from the headquarters. If there is any jam on telephone we have arranged for three more wires at Twenty-third street and Eleventh avenue, the building on the southwest corner. But I don't expect any great jam. Then these men will do the hotels and telephone their story from whichever hotel they are in. The operator has been instructed to use every switch except one for the 'Titanic' story, so there will be lots of wires, with men at each end to take stories. But it will help if the stories can come over the four special wires.

"The way the telephones will be cared for is this: When a man comes into headquarters, he will be told which telephone to use, so that the men at this end of the wire will not be interrupted. That is to say, over one wire will come the story of the arrival of the 'Carpathia.'

"Over another wire will come the story of the wreck of the 'Titanic.'

"Over a third telephone will come the story of the rescue work by the 'Carpathia.'

"And over the fourth will come the story of survivors.

"As soon as a man gets into the office he will write down the name of the person he has interviewed. This list will be posted over each wire. If a reporter sees that the man he has interviewed is already posted, pass up the story."

The city editor stopped talking.

"Are there any questions?" he asked.

"Have I made it clear what each man is to do?"

"You're the goods!" said the youngest of the group, marveling at this master mind that could see the whole scene long before it should be put into cold type and placed before a million readers.

"Then go to it!" said the city editor.

Mr. Nicholas W. Tchaykovsky, the venerable Russian patriot, recently acquitted after a trial for conspiracy, sends us this illustration and that reproduced below. Funds are being collected to relieve the famine in Russia, and American subscriptions will be received by the Russian Famine Relief Fund, 135 East Fifteenth street, New York.

The upper illustration presents a Tatar family, of which the two youngest members are ill with measles. The father has gone to dig a grave for another member of the family. There is no fuel to heat the mud hut, altho the temperature is 20 degrees Fahrenheit below zero. The lower picture represents a crowd of children in a village of mixed Russian and Tatar population gathered to await the daily allowance from the soup kitchen established in the hut at the back.

Literature

William James

"We are delighted when we expect to see an author and find a man."

WITH this quotation from Pascal Professor Boutroux, of Paris, begins his sketch of the life and thought of the late Professor James, of Harvard.¹ It is a happy keynote, this emphasis on personality, for few philosophers have made so much of personality. He believed in its permanence and devoted much of his life to a search for experimental evidence in support of this belief. He had a chronic distrust of abstract theories and formulations, in which the personal desires of the author found or appeared to find no expression. His own philosophy was saturated with himself, and his circle of friends was even wider than his circle of disciples. Many tributes of appreciation and affection have appeared since his death on August 26, 1910, but this little volume is especially welcome, for M. Boutroux, at one time exchange professor at Harvard, knew James well, and since his philosophical point of view is similar he is able to interpret him sympathetically.

He has indeed been remarkably successful in giving in such brief space a clear survey of James's varied activities, and in showing how naturally he was led from physiology to psychology, and from psychology to metaphysics. The greater part of his constructive thinking was done during the last ten years, after he had received his death sentence and knew that any moment his work might be cut short by heart failure. But his courage did not fail nor his industry slacken. In spite of increasing weakness and pain he labored with feverish haste to put into systematic form his message to the world.

The essay on James by Professor Royce² is an admirable complement to the above, for as his lifelong friend and

colleague at Harvard he of course knew James much more intimately than M. Boutroux, but his philosophical attitude is more antagonistic. He, therefore, passes lightly over the metaphysical theories of James in order to consider his contributions to religion and to ethics. "From the point of view of the competent student of our philosophy," says Professor Royce, "the representative American philosophers are now three and only three—Edwards, Emerson, James."

Professor Royce regards "The Will to Believe" as the best expression of James's philosophy of life, and he summarizes the argument of this volume so admirably that we must quote the passage:

"The need of active faith in the unseen and the superhuman he founds upon these simple and yet absolutely true principles, principles of the true dialectics of life: First, every great decision of practical life requires faith, and has irrevocable consequences, consequences that belong to the whole great world, and that therefore have endless possible importance. Secondly, since action and belief are thus inseparably bound together, our right to believe depends upon our right, as active beings, to make decisions. Thirdly, our duty to decide life's greater issues is determined by the absolute truth that that, in critical cases, the will to be doubtful and not to decide is itself a decision, and is hence no escape from our responsible moral position. . . . We have a right to interpret the universe so as to enable us to act at once decisively, courageously and with a sense of the inestimable preciousness and responsibility of the power to act."

Besides the opening essay on James, Professor Royce's volume contains four others of great interest. One of them contains the essence of his "Philosophy of Loyalty." Another is his Heidelberg address on the problem of truth, a criticism of pragmatism from his own standpoint of absolute idealism. A third is a lecture on "Immortality." The longest and in some respects the most helpful of them all is that on "What Is Vital in Christianity," delivered before the Harvard Y. M. C. A., and expressing his conception of the incarnation and atonement.

Mistress of the Southern Seas

OF the two books on Chile which stand upon our desk, the former, a thoroly acceptable addition to a popular series already praised in *THE INDEPENDENT*, is a general account of the great South American republic;¹ the latter, a somewhat less useful contribution to the historiography of Latin-America.²

This field is, alas, so under-developed that the chance resident or traveler, whatever his walk in life, feels free to write the history of the region he has visited. He frequently brings out his book, enjoys the thrills of authorship, and gets away unscathed because the reviewers are even more ignorant of his field than he is himself. We have in *The Independence of Chile* the work of a physician. It is written to catch the public eye, yet contains neither index nor maps; and it includes a bibliography

of twenty-two titles, only five of which are in English. It contains no preface; but its opening sentence speaks of the rise "from the decay and degeneration of despotism and selfishness" of the "white flower of freedom" (p. 3). It surveys with adverse judgment the Spanish colonial system, and traces the transition of the patriotic revival into independence. The war of liberation is treated with detail and eloquence. O'Higgins, San Martin and the picturesque Cochrane fill the pages with their intrigues and their valor, and when these were discarded in ingratitude, Dr. Chisholm deftly congratulates both them and the Chileans who put them aside, for the "state could not, with dignity and moral profit, continue to be governed by individuals rendered irresponsible by prestige or gratitude. As to the heroes themselves, their work was done, and only time could mature, consolidate and perfect it. Moreover their memory has become dearer and their luster brighter from the unmerited humiliation that obscured their last earthly years, and which has added something like the glory of martyrdom to the splendor of virtue."

Mr. Winter's book, without being a model of style, is far superior in its gen-

¹CHILE AND HER PEOPLE OF TODAY. An Account of the Customs, Characteristics, Amusements, History and Advancement of the Chileans, and the Development and Resources of Their Country. By Nevin O. Winter. Illustrated from photographs. Boston: L. C. Page & Co. \$3.

²THE INDEPENDENCE OF CHILE. By A. Stuart M. Chisholm. Boston: Sherman, French & Co. \$1.50.

THE ACONCAGUA RIVER

An illustration from Winter's "Chile" (L. C. Page & Co.)

eral apparatus. The index and the bibliography figure here: tho we see no good reason for omitting the titles of books in French and Spanish. For traveling dilettante and merchant alike there is much to hold the attention.

The New Democracy

DEMOCRACY in America is burgeoning anew. After the winter of sleep which succeeded the fierce heat of the Civil War the century-old tree is putting on a fresh beauty and strength. That continent-wide unrest which alarms financiers and inspires plain patriots, is a sign of new life. In the political parties insurgents refuse to keep the peace. Among the citizens there goes on an active struggle to depose the boss and his business paymaster and to restore government to the voters.

This is the New Democracy* which is the subject of Dr. Weyl's brilliant, cogent and erudite work, a volume which shows on every page the practised hand of the magazine writer, who must never be dull and must make every sentence scintillate.

In great part the yeasty uprising among the people is instinctive but ill-reasoned. Even the leaders' minds are often confused. They look longingly backward to the pioneer days, when all business was on a puny scale and competition was actually "the life of trade." Dismayed by the growth of trusts and monopolies they would fain restore an imagined golden age when a poor man could start a business, railroads kept no lobbies and Andrew Jackson wrestled with the United States Bank.

If the New Democracy is to win any more than stage victories it must be capably directed. It must diagnose the national ills correctly and concoct the medicines for them skilfully. Dr. Weyl has indicated both the disease and the remedies.

The New Democracy resembles in some points Croly's "Promise of American Life," from which Colonel Roosevelt got the New Nationalism which he preached for a season. Each gives an illuminated panoramic view of the

growth of democracy in America. But, whereas Mr. Croly makes a searching analysis of the ideas of liberty and equality which underlie the democratic teachings, exposing their self contradiction and propounding a really new intellectual basis for national policies, Dr. Weyl adopts the democratic assumptions and narrates how they are gradually receiving new political, social and intellectual expression. The author delivers no distinctively original message. He is an expositor, not prophet nor philosopher. He does not unfold a continuous argument; he makes a survey. His purpose is to enrich democracy by gathering under its banner all the new popular movements in politics and society.

His exposition covers a wondrous range. Neither Democrats nor Republicans, nor both together, perceive the far-stretching empire with which the writer would endow democracy. To him direct primaries, short ballot, initiative, referendum and recall, woman suffrage—all the machinery by which the short-sighted set too much store—are but necessary means for securing popular control of industry and wealth, for guaranteeing to the unprivileged better health and education, more wages and leisure, for winning a social democracy which is an expurgated socialism. Not that the abstract, absolute, uncompromising dogmas of socialism—the class war and the rest—are claimed for democracy. They are repudiated. Kindly but firmly they are thrust beyond the pale. But the essentials of opportunist, practical socialism are unblushingly appropriated and claimed as the natural possession of democracy. Time will show whether this surreptitious endowment will be welcomed. All socialists are democrats: but not all democrats will admit they can possibly be socialists—not even of the mildest, canary-keeping kind.

In the closing chapter, when discussing whether a democracy can endure, the author just skirts the profounder problem of eugenics, the question of quality of population, which, to philosophic democrats, is daily gathering more solemn importance. Democracy assumes that an improved environment will produce a race capable of winning and keeping a civilization higher than we have thus far

*THE NEW DEMOCRACY. By Walter E. Weyl, Ph.D.
New York: The Macmillan Co. \$2.

attained. The eugenist, when he is also a democrat, disappointed at the slow advance of half a century, dismayed by the discovery that the ignorant, the oppressed and the ill-bred have not answered the expectation of democracy by raising themselves and ushering in a new kingdom on earth, is anxiously inquiring whether they are not inherently incapable of doing that task. On one point Dr. Weyl agrees with the eugenist and is in conflict with most ardent democrats. He would regulate immigration more searchingly. However, the eugenist says that dilution of the American race with lower types from South-eastern Europe and from Asia has gone on so long that even if checked at once, it is doubtful whether it has not made, along with the negro, a problem for democracy so complicated and cumbrous that it will overtax the brains and powers of the ablest and most devoted patriots. Perhaps only after breeding for quality for a generation or two will society gain the innate power necessary for the solution of the problems of the New Democracy.

The Life and Times of Cavour. By William Roscoe Thayer. Boston: Houghton Mifflin Co. (2 vols). Pp. 1166. With 51 Illustrations. \$7.50.

The Risorgimento, the movement which welded modern Italy together, has enlisted the attention of many writers—poets, novelists and historians; not, as in the case of Greece, because of the classical tradition, but because of the remarkable group of men who connected themselves with the event. It was not the work of a people; Mr. Thayer dispels that myth. It was the work of

leaders who secured a following among the upper and middle classes. The greatest of those leaders was Cavour, in many ways the greatest figure to appear in Europe since the fall of the first Napoleon; and what Trevelyan has done in his brilliant volumes to immortalize Garibaldi, Mr. Thayer has done for the memory of Cavour. No one can read the book without a feeling of admiration for the tireless patience which

sifted the rich store of materials, and the dramatic sense which gave the narrative such vividness without sacrifice of truth. Tho the hero is represented as a hero, his weaknesses are not disguised; and in the same way Napoleon III, tho regarded with disfavor, is shown to have had adequate reason for his desertion of Italy at Villafranca. Here is the author's estimate of Cavour:

"Any one can brandish the magician's wand; only the magician himself can

conjure with it. Slowly the world has come to see that Cavour's achievement was not due to a succession of dazzling dexterities, but to the genius of the man—genius in which we must reckon temperament and natural aptitude, character, training, and an almost infallible eye for opportunity. He was a lifelong pupil of experience. . . . To Italians Cavour will stand for all time as the builder of their state. Many quarried: he took the blocks, of every size and shape and quality, and made United Italy out of them. He used the material at hand, as the true architect does."

Mr. Thayer has written frankly from the political standpoint; but tho he gives little attention to social and economic conditions, there is ample evidence that he understood their significance quite well. He is, by the way, an American, and favorably known for his work on "The Dawn of Italian Independence."

CAVOUR'S LAST PORTRAIT

From Thayer's Biography (Houghton Mifflin Co.)

The Civil War. By F. L. Paxson. New York: Henry Holt & Co. 256 pages. 50 cents.

We are furnished in this little volume the best brief account of the Civil War that has been written. The author knows much of his material first hand, but his great dependence, as he frankly states, has been upon the best of the writers who have made special studies of various phases of the struggle, and most of all upon "the profound, judicial and enlightened pages of James Ford Rhodes," whose great and voluminous work Mr. Paxson has so successfully condensed. The admirable thing about the author's work is the fact that condensation has not meant, what it so often does in literature, dessication. We have here no Ploetz's "Epitome of History," no mere dry bones of historical events, but the living, fascinating story of the essential phases of one of the most humanly interesting struggles in history. The reviewer read it in a single evening, as he would have read nothing else but a tale of romance. Yet interesting as the work is, the truth pervades all its pages. No error of moment has been noticed. There are many judgments which men with other points of view will question, and these judgments are frankly, forcefully and confidently stated. There is no evasion. The author does not stand shivering on the brink of a decision, but plunges in confidently, unhesitatingly. A broad, generous philosophy pervades all of his general conclusions, and may be seen in the first sentence of the preface:

"It is the attempt of this book to show that the Civil War . . . was a struggle between two civilizations, each the logical result of its environment, and each endeavoring to work out the best American interest as it saw it."

The Truth About Chickamauga. By Archibald Gracie. Pp. xxxii, 462. Boston: Houghton Mifflin Co. \$4.

"The history of Chickamauga," says our author, "has, ever since the day it was fought, been made a conspiracy for the silencing and suppression of the truth." It is not likely that unbiased persons will hold a different view after reading his authoritative presentation of the facts. Misrepresentation began immediately after the battle. The personal

issues which were raised—for instance, between General Rosecrans and some of his subordinates—have had the effect of obscuring the most important incidents of the battle; and existing accounts, largely drawn from the newspapers, are colored by a partisanship which has made and destroyed reputations without any scruple. Rosecrans bore his part in distorting the truth. So, apparently, did those who, under governmental authority, wrote the history of the battle upon the battlefield itself. Mr. Gracie considers Chickamauga not only a Confederate victory, but one of the most important victories which the South won during the war. If Buckner had not been ordered to discontinue the pursuit, not one Federal soldier would have escaped across the Tennessee; and "the military and financial history of the time proves that the immediate recognition of the independence of the Confederacy would have followed the destruction of Rosecrans's army." Into the preparation of this volume Mr. Gracie put eight years' work. While he neglected no other sources of light, his conclusions are mainly based upon the "Official Records," exact references to them appearing in the footnotes on every page. Nine maps, four views of the battlefield, and the portraits of more than a hundred Federal officers, add to the value of the book. As regiments from nineteen States were engaged at Chickamauga, the minute details which Mr. Gracie gives should arouse a wide interest.

The Call of the Carpenter. By Bouck White, Head Resident, Trinity House, New York. Garden City, N. Y.: Doubleday, Page & Co. \$1.20.

A few years ago in Germany much attention was given to the theory that Christianity was originally a social movement among the slave populations of the Roman Empire, and that the Jesus of the Gospels was not historical, but an idealized expression of the longings and aspirations of this Roman underworld. Later and fuller investigation has revealed to the critical eye so much of contemporary myth, allegory and mystic rite woven into the story of Jesus that these opponents of his historicity have

been obliged to supplant the social idealization with a religious one. Now comes Mr. Bouck White and declares that both views are wrong. These ultra critics, as well as the "muzzled" orthodox interpreters of the historical school, have one and all misread the Gospels. The Jesus there portrayed is not primarily a divine person, a religious genius or an idealized reformer; he is a social revolutionist of the most realistic and radical sort, "the Insurgent of Galilee," the fierce and unrelenting leader of the rising proletariat to which he belonged. To unearth this picture of the Carpenter, to rub off the accretions and incrustations of the centuries, to enliven again its "vivid tints," and to raise it aloft as a standard for the rallying hosts of present-day rebellious "wage slaves," is the object of Mr. White's book, which he "affirms to be a piece of cool, scientific history," but which is really an inconsistent, erratic, ill-founded, highly colored piece of special pleading. The imagination is stimulated by such stylistic decorations as "vested interests," "Cicero tribe," "Caia-phas crowd," "brain sweat," "exploiters," "head-on collisions" between Jesus and "the system," "retainers" and "non-consumers," but these expressions are more exciting than convincing in "cool history." Of course, Mr. White has no patience with the virgin birth stories of Jesus, whom he regards as the natural son of Joseph, and whose resurrection he does not deem worthy of notice. The revolution which Jesus began made marvelous strides after his death under the leadership of his mother and his immediate disciples, and would eventually have succeeded had not the Roman "capitalistic class," thru the influence of Paul, "kidnapped" and "annexed" the whole movement, thus stemming the tide of democracy and holding it in check down even to the present time. Paul, therefore, from the true Christian—i. e., revolutionary—standpoint, is anathema, and humanity must now rid itself of this Roman incubus and his Greek conception of a sovereign God, "Creator and ruler of the universe"; going back for its only and real "Father, Son and Holy Ghost" to "that carpenter shop in Nazareth" where it will find a fulcrum from which democracy can move the world. To such "scientific history" Mr. White

has been able to give the semblance of truth by disregarding some facts and inventing others, by warping the plain statements of the Gospels, by drawing copiously on his own imagination, and by handling the results of New Testament criticism with offensive superficiality. As regards the picture of Jesus, the result of the author's labor is an imaginary creation instead of a historical character, and the lack of creative genius in Mr. White leaves his creation without unity, consistency or attractive power, and marred by coarse touches of questionable interest to any one and of positive aversion to a great many.

The Life and Love of the Insect. By J. Henri Fabre. Translated by Alexander Teixeira de Mattos. New York: The Macmillan Co. \$1.75.

We have before called attention in THE INDEPENDENT to the fact that both Maeterlinck and Bergson derive some of the happiest illustrations of their philosophy from Fabre's studies of insect life. The reader of this volume will not wonder at the fascination Fabre exerts over such minds. He is able to interest anybody in insects because he is first interested in them himself. He does not, like many of the younger set of entomologists, look upon insects with an eye solely to their possible value as material out of which to extract a Ph. D., but because he likes to watch them. He has spent the greater part of the past eighty years in getting acquainted with the bugs and beetles in the neighborhood of his Provençal birthplace. Consequently he is able to tell something about the *life* of insects, not merely about their dead bodies; he knows them as individuals, not merely as specimens of a species. His interpretation of their actions and emotions is frankly anthropomorphic, but perhaps this is nearer the truth than the anatomical studies which attempt to monopolize the name of science. Maeterlinck was justified in calling M. Fabre "the Homer of the insects," for his language has the true epic swing when he describes the fight of the wasp and spider or the rape of the lady scorpion. It is lucky Kipling did not know about the female of this species. She certainly carries feminism to an extreme, for she eats her husband when tired of him.

Literary Notes

....In the short, explosive chapters of *God and Democracy* (Forbes; 50 cents) Rev. Frank Crane has set forth a striking plea, based on practical needs, for the exaltation of service rather than dominion as the dominant characteristic in the idea of God.

....Short, well-written sketches, biographical and critical, of Thomas Nelson Page, Charles Egbert Craddock, George W. Cable, James Lane Allen and Joel Chandler Harris make up an attractive little book which its author, Harry Aubrey Toulmin, Jr., entitles *Social Historians* (Badger; \$1.50) and for which Prof. Charles W. Kent provides a pleasant introduction.

....Novel, interesting and delightful are the stories describing the daily life and thoughts of the peasants of modern Greece, particularly of the Island of Poros, which Julia D. Dragoumis has produced in *Tales of a Greek Island* (Houghton; \$1.35). Written on the spot, which the author avows is one of the most beautiful in a land of beautiful islands, these simple, appealing tales of a wretchedly poor but contented people abound in vivid and wonderfully human touches and beautiful descriptions.

....The friends of M. Anatole le Braz, who is now touring the States as a lecturer of the Alliance Française, will find in *Ames d'Occident* (Paris: Lévy; 3 fr. 50) seven well contrasted tales of the Brittany whose poet he is. Two of these tales represent in definitive form earlier stories of his province; one of them, "Chez le Dernier des Nial Mor," is a reminiscence of an Irish holiday, and serves to remind us how close the bond is, in temper and tradition, between Celtic Brittany and Celtic Ireland. The savor of salt, mysticism, and good humor adheres to these narratives of the French Far West.

....*Mona, A Drama*, by Brian Hooker (Dodd; \$1.25), is the libretto of Prof. Horatio Parker's opera which won the \$10,000 prize of the Metropolitan Opera House, and was there performed for the first time on the evening of March 14. As compared with the ordinary "book of the opera" Mr. Hooker's tragedy of the ancient British princess-reformer, who tries to revise the world by doing something instead of raising its average by being something, possesses literary merit of a high order; and, if for this reason alone, was worthy of publication. Those who delight in old-world romance cast in the form of dramatic verse will enjoy it, for it "reads well." But neither the poem nor the music of this mis-called "American opera" makes any distinctively American appeal.

....The songs of Modeste Hannis Jordan, "gathered between covers from far and wide," have the merit of simplicity, love of rural scenery, and restfulness. *Vagrant Verses* (The Cosmopolitan Press, New York; \$1). A single stanza may serve to indicate their weakness and their strength.

"Not with the strong would I run,
Not with the doubters of good,
Not in the glare of the sun,
But rather the shade of the wood."

and one needs a good deal of that spirit in these days.

....George B. Balch, *Illinois Pioneer*, has done his work—no doubt a good work—and is dead. His poems, dear to his neighbors and friends in a small circle, have a charm to just such a circle. (Sherman, French & Co., Boston; \$1.25.)

....In our issue of April 25 we noticed the publication by Messrs. Constable, of London, of Edmond G. A. Holmes's *What Is and What Might Be*. This book now comes to us with the imprint of Messrs. E. P. Dutton & Co.

....The New York *Sun* recently published an interesting account of John Masefield's experiences in New York ten years ago when he served as general roustabout in a Sixth avenue saloon. The *Sun* gives 1908 as the year of his entry into literature as the author of a published book, altho in 1906 was published his anthology entitled "A Sailor's Garland"; and on the title page of this book one is informed that the writer is responsible also for "Sea Life in Nelson's Time" and "On the Spanish Main." These are specimens of the hack work of a most unusual author. Like Joseph Conrad, Masefield has been a sailor, and one finds similes and metaphors drawn from his sea experience as the only figures in his verse which are not essentially sordid. One may like or dislike Masefield's recently published book of narrative verse entitled *The Everlasting Mercy* (Macmillan; \$1.25), but one cannot deny him a vigor and sincerity rare in modern English literature.

....A volume of essays by H. Belloc rewards the reader in the same way that a desultory walk thru the fields brings delight to an aimless saunterer. *First and Last* (Dutton; \$1.25) is no dusty highway between straight walls, but a footpath full of unexpectedness and whimsical indirections. There are discussions of cheeses, of tides, and of winds, as well as of historical evidence and of the Battle of Hastings. The essays lack the electric snap of Chesterton's, but they are graceful and pleasant reading.

....Now that Mr. Roosevelt is seeking the Presidential nomination, the fourth edition of a little volume entitled *Rooseveltian Fact and Fable* just issued will delight all his enemies.

The author and publisher is Mrs. Annie Riley Hale, 6 West Sixty-sixth street, New York.

....Patrick H. W. Ross in *The Western Gate* (Dodd, Mead; 75 cents) argues enthusiastically for the opening of Puget Sound as a national free port in order to develop the Pacific commerce as England dominates the Atlantic. Mr. Ross is undeniably a visionary, but we are not sure that his vision is false. At any rate the book is inspiring and suggestive, notwithstanding his propensity to indulge in wild generalizations on racial characteristics.

....Portsmouth gave at least three men of letters to the nineteenth century: Charles Dickens, Sir Walter Besant and George Meredith. A cousin of the last of these writers contributes to *The Fortnightly Review* for April a paper on "George Meredith and His Relatives," which will be welcomed as throwing some light upon a life about which a veil of ignorance has long hung. In Captain Marryat's "Peter Simple" there is mention of "Meredith the tailor," who promised "that by the next morning we should be fitted complete." This Meredith was Melchizedek Meredith, grandfather of the poet and novelist. His tailoring establishment at 73 High street, Portsmouth, was known to all the world, and he was himself the original of "the Great Mel" in "Evan Harrington." He kept horses and hunted; he was initiated as a Freemason in the Phoenix Lodge, Portsmouth, as "a gentleman"; in 1801 he was an officer in the Portsmouth Yeomanry Cavalry. George Meredith's father, Augustus, was a less notable person, filially described as "a muddler and a fool." Of his mother, Meredith said to Mr. Edward Clodd: "She was of Irish origin, handsome, refined and witty. I think there must have been some Saxon strain in the ancestry to account for a virility of temperament which corrected the Celtic in me." But Meredith's mother, Jane Macnamara, daughter of Michael Macnamara, died when he was only five years old; and five years later he was sent away from Portsmouth and placed in a school of which his chief recollection was "three dreary services on Sunday; the giving out of books being the signal to me for inventing tales of the St. George and dragon type. I was fond of the 'Arabian Nights,' and this doubtless fed an imagination which took shape in 'The Shaving of Shagpat.'" At about fifteen the boy Meredith was sent to school at Neuwied, Germany, and there are echoes of his German experiences in "The Adventures of Harry Richmond." Reading Mr. Ellis's contribution to *The Fortnightly* not only teaches one a little something of Meredith's early surroundings and of his forbears, but crushes for all

time the legend which hinted at a mystery in the novelist's birth: one variant having named the poet Arthur O'Shaughnessy as his paternal parent.

Pebbles

"Dog watches are common on ships, but what can a cat do?"

"She comes in handy for a purr, sir."—*Baltimore American*.

"SAM JOHNSON, you've been fightin' agin. You'se lost two of yo' front teeth."

"No, I ain't, mammy, honest. I'se got 'em in me pocket."—*Life*.

"GWENDOLEN, have you been out driving with a young man?"

"Yes, auntie."

"H'mph!"

"But he had only one arm that he could use, auntie; he had been vaccinated on the other one."

(Pause.)

"Gwendolen, didn't you do the driving?"—*Chicago Tribune*.

THE THINGS MY WIFE HAS PUT AWAY SOMEWHERE.

Once I had a meerschaum yellow,
Nevermore I'll know its fellow.
How one whiff of it would banish every care!
And its loss I still deplore,
But I'll never see it more,
For my wife has got it put away somewhere.

And my pair of slippers oldest
That I loved when nights were coldest,
When close to the cheery hearth I drew my chair,
Now from mortal eye are hid,
Like the gold of Captain Kidd,
For my wife has got them put away somewhere.

'Tis a rule that's ne'er unheeded
That what's sure to be most needed
She must hide away with skill beyond compare.

To the things that once we knew
We can find not e'en a clue
When my wife has got them put away somewhere.

Oft I've told her, "Burn it, break it,
Or to some poor family take it;
Let me know it's gone, and save me from despair;

But do not, I beg and pray,
Let me hunt till I am gray,
For the thing I know you've put away somewhere."

When the sea gives up its dead,
When the Judgment Book is read,
When the last cold storage chicken is laid bare:

Then perhaps we'll find some trace
Of the secret hiding-place
Of the things my wife has put away somewhere.—*Puck*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, \$3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

The President and Mr. Roosevelt

MR. TAFT approached the performance of an unpleasant duty with reluctance. We believe that he was not guilty of exaggeration when he said that it "wrenched" his "soul" when he felt that he must answer in public the attacks made upon him and his administration by Mr. Roosevelt. But it was a task—in the interest of the American people rather than in defense of himself—which could no longer be avoided. He has done the work effectively and with dignity. Mr. Roosevelt's insincerity, inconsistency and deliberate misrepresentations, some of which might justly be characterized by "a shorter and uglier word," have been exposed.

The long address made by the President at Boston, an address which had been approved by the members of his Cabinet, deserves to be read from beginning to end by all who want to know the truth. It is one of the most remarkable speeches ever delivered in a political campaign. We shall now refer briefly to the leading parts of it which show the present character of the ex-President. We say "present," because the Theodore

Roosevelt of today is not the Theodore Roosevelt of a few years ago. First, it is true, as Mr. Taft says, that Mr. Roosevelt has repeatedly misrepresented what the President said at Toledo. Mr. Roosevelt's attention was directed again and again to this misrepresentation, but to no purpose. He persisted in using it. He sought to convince the public that Mr. Taft openly preferred an oligarchy of bosses. In Illinois, he and his agents associated Mr. Taft with Lorimer. But the ex-President well knew what Mr. Taft's attitude toward Lorimer was. He had in his possession a letter in which Mr. Taft said:

"I have read as much of the evidence as I could get at, and am convinced that there was a mess and mass of corruption upon which his election was founded that ought to be stamped with the disapproval of the Senate. I want the movement to oust him to succeed."

"Of all people in the world," says the President, "Theodore Roosevelt ought to have known, and did know, that I was not a partisan of Lorimer, did not sympathize with him, and was perhaps the last man of whom such a thing could be said." The reciprocity agreement with Canada, which Mr. Roosevelt now condemns, had been explained to him by Mr. Taft before it was negotiated. Mr. Roosevelt expressed his approval "in the most enthusiastic terms," and afterward said in a reply to a long letter from the President:

"It seems to me that what you propose to do with Canada is admirable from every standpoint. I firmly believe in free trade with Canada for both economic and political reasons. As you say, labor cost is substantially the same in the two countries, so that you are amply justified by the platform. Whether Canada will accept such reciprocity I do not know, but it is greatly to your credit to make the effort. It may damage the Republican party for a while, but it will surely benefit the party in the end."

And after the agreement was published Mr. Roosevelt commended it warmly in two public addresses. What Mr. Taft says about the officeholders is interesting. Seventy per cent. of them were appointed when Mr. Roosevelt was President, and a large number of these now support him. But not one has been removed. Mr. Taft retained Mr. Roosevelt's referees in every Southern State. Three of these are working for the ex-

President. But Mr. Taft has repeatedly asked Congress to take from the President his power to appoint the influential Federal officers. Mr. Roosevelt most earnestly advised him to make agreements with Mr. Cannon. The President asks whether Mr. Roosevelt has ever condemned the Payne tariff revision. The record of the New York convention at Saratoga answers this question. That convention was controlled by Mr. Roosevelt and his friends. They made a platform the tariff plank of which might have been written by Mr. Payne or Mr. Aldrich, and in his address to the convention Mr. Roosevelt commended all the achievements of the Taft Administration. It is shown that the proposed and rejected amendments to the Interstate Commerce bill, amendments which Mr. Roosevelt now denounces as vicious, had been supported by him in messages. The court's decree in the Standard Oil and Tobacco Trust cases, now declared by Mr. Roosevelt to be worthless or ineffective, "was drawn exactly as Mr. Roosevelt's Attorney General, in the bill which, by direction of Mr. Roosevelt, he filed against the companies, had asked that it be drawn."

This is only a part of the proof of Mr. Roosevelt's insincerity and inconsistency. Probably the ex-President assumed that Mr. Taft would remain silent, that he would not fight. But this was not always his opinion. In a magazine article published a short time after Mr. Taft's nomination in 1908, Mr. Roosevelt was quoted as saying: "There isn't a mean streak in the man's make-up." And when the interviewer suggested that Mr. Taft was "not of the fighting type," Mr. Roosevelt replied:

"Yes, he is. No man fights harder when he thinks it necessary; but he hates to fight unless it is necessary."

The closing paragraphs of Mr. Taft's address are a solemn warning, made emphatic by the fact that it is uttered by the President of the United States against an ex-President whom he once "admired and loved." The essence of it is that Mr. Roosevelt ought not to be nominated because of the business community's distrust with respect to the measures he would propose; because this distrust would prevent prosperity, and because

no one should be permitted to have a third Presidential term. He quotes Mr. Roosevelt's memorable promise:

"If he had frankly announced that he had changed his mind, no one would be disposed to hold him to a promise of that sort merely because he had made it. The promise and his treatment of it only throw an informing light on the value that ought now to be attached to any promise of this kind he may make for the future"

His ambitious plans, Mr. Taft thinks, could not be carried out "in one short four years." The "job" might require "the rest of his life."

"There is not the slightest reason why, if he secures a third term, and the limitation of the Washington, Jefferson and Jackson tradition is broken down, he should not have as many terms as his natural life will permit. If he is necessary now to the Government, why not later? One who so lightly regards constitutional principles, and especially the independence of the judiciary, one who is so naturally impatient of legal restraints and of due legal procedure, and who has so misunderstood what liberty regulated by law is, could not safely be intrusted with successive Presidential terms"

To Mr. Taft's facts and arguments it is an insufficient reply to say:

"It is a bad trait to bite the hand that feeds you. Mr. Taft is President only because I kept my promise in spite of infinite pressure to break it."

The effect of this controversy upon the Republican party cannot fail to be unfortunate. We are still of the opinion that independent voters may well exert their influence to promote the nomination of the best Democrat in the field.

Business and Manslaughter

"BUSINESS men would rather risk their neighbors' lives than their own money." The saying has a harsh sound, but that is not the fault of the adage. The harshness lies in the facts. To revolutionize the facts has become one of the most imperative moral and legal duties of the community.

Such appalling disasters as the Iroquois Theater fire, the Triangle shirt-waist fire, the burning of the "Slocum" and the sinking of the "Atlantic," the "Bourgogne" and the "Titanic," are sacrifices of human life to greed. It is idle to plead that the sacrifice is incidental and unexpected. A game of chance is played, in which the cards are

stacked with the odds tremendously against human life. Enormous money losses are possible, but in the long run the losses figure up as a small percentage of profits. Human life may escape for months, or years, but the day comes when the game turns against it, and then we discover that, from the first, its fate has been as inevitable as the ruin of any fool who bets to break the bank at Monte Carlo.

Only by looking at the gamble in this cold-blooded way is there the slightest possibility of reforming the game. The moralist and the humanitarian, the legislator and the jurymen, who cannot see or will not see that the whole thing is, in fact, a gigantic gamble, wastes his time and his breath.

And yet, when all this is perceived, it is still idle to talk about it, or to try to reform it, unless the reformer is prepared to take measures that greed can feel. It is useless to plead with greed to be tender-hearted. It is mere blasphemy to ask greed to admit the claims of either pagan philosophy or Christian ethics. Greed feels nothing, knows nothing, cares for nothing but profits. It fears nothing but the loss of dollars. Greed can be restrained only by mulcting it.

This is the absolutely sound justification for stringent legislation compelling corporations to make decent provisions for the safety of their employees and the public. Not one step toward such provision has ever been made except under compulsion to take it or suffer an appreciable money loss. It was under money compulsion that railroads abandoned the car stove. The horrors of the human holocausts that they were in the habit of indulging in every year or two for profits' sake made no more impression on their souls than a bramble scratch makes on the hide of a savage. The abolition of the hand brake and the link coupling on freight trains also has proceeded under compulsion. The annual slaughter of as many brakemen as of soldiers in a great battle was a circumstance which the railroad companies cared no more about than they care about the agonies of sheep and hogs in their stock trains. But a positive money loss or an actual danger of forfeiting

franchises were penalties that they could feel.

There is no more reason to suppose that steamship companies, or shirt-waist manufacturers, or jerry builders, are distressed by the sight of human beings crushed under falling walls, or leaping all aflame from tenth story windows, or drowning in mid ocean, than there is to suppose that a cat is distressed by the sufferings of the mouse that she paws and crunches. This, too, is a hard saying, and the sentimentalist protests whenever a truth-telling lover of his kind, in the interest of mercy, has the courage to say it. It is, however, the truth—hard, brutal, disgraceful, unforgivable—and the sentimentalist who objects to hearing it is a public nuisance. The one thing that we have to be thankful for over and above the moral heroism of some of the victims of these calamities is the fact that the malefactors have suffered to some extent in business and estate. To make them suffer more is the one possibility we have of compelling them to heed the moral law. When the community fully and clearly realizes this brutal truth, and in a merciless, cold-blooded way proceeds to make these malefactors pay the one penalty that they are capable of dreading, a money loss, big and inevitable every time that human life is sacrificed, there will be an end of such sacrifices. Until then there will be nothing but idle talk and imbecile appeals to consciences that do not exist.

Candidates for the Ministry

THIS is the season when the senior students in our theological seminaries are approaching graduation and are coming before their denominational bodies for examination with a view to approbation as suitable candidates for ordination and a pastoral charge. It is noticeable from the reports of a number of such examinations that there are likely to be present to receive them those who are more concerned that the candidates shall be sound in their theology than that they have the inspirational power to bring men into the Christian life. The examinations are likely to dwell on such questions as these: Do you believe in

eternal punishment? Do you believe in the virgin birth? Do you believe in the bodily resurrection of Jesus Christ? These are important theological questions, but not very important religious questions. They are questions in which good Christians differ, and which may be answered in more ways than one by those who love God and are disciples of our Lord.

For practical life other questions are more important. Paul did not think the virgin birth, if he had ever known of it, important enough to mention it in any one of his letters. He did think the resurrection of Christ important. He was sure Jesus had arisen from the dead, for he had himself seen him, but not in that bodily form that we are familiar with. His experience was enough to satisfy him of his Lord and of the resurrection of the dead in a spiritual body, which we call the immortality of the soul. The writers of the Gospels believed that Jesus rose from the dead, appeared to them and disappeared, but they were not concerned with the analysis of the resurrection body, whether physical or spiritual. One can believe either way, or even believe that legend entered into composition of the Gospels, and yet do all that Jesus required, in love and faith in the Heavenly Father and service of one's fellowmen.

Equally the question whether eternal death is eternal suffering is one that does not need to stand chief in pulpit teaching, as it certainly does not. The argument prest for it on these students is that Jesus said it was eternal "æonian." But what does "æonian" mean? Did he say there was "a great gulf fixt"? But must we interpret the parable so realistically as to suppose that there is a real gulf between heaven and hell, and that the word "fixt" means eternity? And must we as strictly interpret that other parable about the foolish virgins shut out into outer darkness? Was Jesus speaking theologically, philosophically, with a view to teaching us in these subsequent ages with the very exactness of scientific definition, or was he talking largely, rhetorically, with the emphasis needed for persuasion and conviction, to Orientals who had never heard of logic?

Even as to the doctrine of our Lord's

resurrection, good Christians may believe in it in different fashions. They may differ as to whether it was material or spiritual; and even whether those that reported it told it consistently, or incorporated into it a certain element of legend. But they cannot be Christians unless they have learned to love and follow the substance, the essential substance of Christ's teaching behind its transitory expression, underneath all its rhetoric and parable. The meaning, so far as it applies to duty to God and man, to faith in the eternal Father and love to our human brothers, whoever they are, even despised like the Samaritan, even to our enemies, can never be mistaken. For that is what Jesus was talking about, while he never uttered a word of what we call formal or polemic theology.

What then would we say to the presbyteries, associations, conferences or what not, before which these young men come for recognition as candidates for the ministry? Just what Jesus said, "Forbid them not." If they have the heart to cast out devils in our Lord's name; if they have zeal and intelligence and love, bid them God speed. Possibly their doubt may be wiser than your knowledge. It may be that this generation may add something to, and take something from the creeds of the past; and those who hold back may be no truer disciples than those who move forward.

Chinese Republicanism

LAST month, when the Empress Dowager and the Emperor, in surrendering the sovereignty of the Manchus to the people, used the words: "From the heart's desire of the people the will of Heaven may be discerned," there were doubtless many in this country who imagined that they detected in this phrase the effect of foreign ideals. *Vox populi, vox Dei* has been current in the western world for a thousand years or more, but it seems likely that the Chinese got ahead of us in the invention of the proverb as they did in the invention of those two other forces of democracy, paper and gunpowder. The Chinese remind us of some ingenious individuals with whom we are acquainted; they have

invented lots of things, but somehow don't get the good out of any of them.

But there is no denying that the Chinese come honestly by their republicanism. They have no occasion to borrow or steal it. It is part of their religion and they can quote chapter and verse from their sacred books in support of more radical measures than the revolutionists have yet taken. The officials which support the old regime owed their positions to their training in the classics that teach the divine right of revolution. "If there were no revolution," says Confucius, "what could make the emperor and princes careful and what could make the common people keep up their ambition?" He characteristically finds justification for his doctrine in the fact that heaven and earth have their revolutions, and so give us the four seasons. Apparently, then, Confucius regarded revolutions as regular and natural incidents in national progress; much the same view as was taken by Jefferson when he said:

"A little rebellion now and then is a good thing. . . . It is a medicine necessary to the sound health of government. . . . God forbid that we should ever be twenty years without such a rebellion. . . . What signify a few lives lost in a century or two? The tree of liberty must be refreshed from time to time with the blood of patriots and tyrants. It is its natural manure."

The revolution of Wu Wang was, says Confucius, "in accordance with the will of God and in response to the wishes of men." Now, Wu Wang some five hundred years before had cut off the head of the Emperor Chou and stuck it on top of his standard, so authority for tyrannicide is not wanting.

Of course, there are proof texts to be quoted on the other side. The Empress Dowager—we mean the great Empress Dowager, commonly known as the Old Buddha—when in 1901 she issued an edict ordering the establishment of constitutionalism, quotes the classics to prove that, while there is no fixed form of government, the principles of ethics are immutable, and that these are founded upon the three eternal relationships: the relation of sovereign to subject, of father to son, and of husband to wife. But on the other hand, it is argued upon equally good authority that

it is only the just sovereign who occupies this position, one who is truly the parent of his people, and when he ceases to rule justly and in accordance with the will of the people, he thereby ceases to be sovereign and may, as an ordinary man, be deposed, or even punished as a criminal. So Mencius, when asked if Wu did right to murder his sovereign, answered: "I never heard that Wu murdered his sovereign. I thought that he only put to death a common ruffian."

The central imperial authority has rarely been powerful in China. It has always been more of a federation of semi-autonomous states than a unified empire. The village community is the real unit of social life and government. The chief supports of aristocracy—hereditary nobility, slavery and a priestly caste—are practically absent. The ruling class is composed of officials drawn from all grades of society by a selective process ostensibly dependent on merit alone. The established system of civil service examinations is excellent in form and now that it is being based upon the requirement of modern knowledge in place of classical learning, it may become an agency for progress instead of conservatism. The following quotation from Mencius might be utilized as the first clause in the constitution of the new republic: "The people are the most important element; the state is the next; and the ruler is the least."

Confucius, it is true, was a supporter of monarchy, but that was because he saw in that the only hope of overthrowing the feudal system dominant in his time and for two hundred and fifty years after. In this he was right, for in China, as in France and England, the people came into their own thru the checking of the power of the nobility by the rise of the monarchy. Few greater prophets than Confucius have ever lived. Twenty-four hundred years ago he outlined the future progress of civilization in his theory of the Three Stages. First came the Disorderly Stage, when the state had to struggle for existence against surrounding barbarism. Then the Stage of Little Tranquillity, when there were numerous small states, being drawn together by mutual interests, but jealously maintaining their individual

independence. In the last Stage war and crime have disappeared, and peace, good will and industry are universal. But let us have the description in his own words.

"The whole world becomes a republic; they elect men of talents, virtue, and ability; they talk about sincere agreement, and cultivate universal peace. Thus men do not regard as their parents only their own parents, nor treat as their children only their own children. A competent provision is secured for the aged till their death, employment for the middle-aged, and the means of growing up to the young. The widowers, widows, orphans, childless men, and those who are disabled by disease, are all sufficiently maintained. Each man has his rights, and each woman her individuality safe-guarded. They produce wealth, disliking that it should be thrown away upon the ground, but not wishing to keep it for their own gratification. Disliking idleness, they labor, but not alone with a view to their own advantage. In this way selfish schemings are repressed and find no way to arise. Robbers, filchers and rebellious traitors do not exist. Hence the outer doors remain open, and are not shut. This is the stage of what I call the Great Similarity."—Dr. Chen's *Economic Principles of Confucius and His School*.

This Stage of Great Similarity is evidently a state of idyllic anarchy, such as Emerson and William Morris hoped for. Some features of it are already attained and others are now almost within our grasp. The programs of practical politicians in many countries include such measures as universal arbitration, laws for the protection of children, and insurance for unemployment, old age, sickness and disability. The transformation of human nature, the eradication of all predatory and belligerent instincts, necessary for the complete realization of the Confucian ideal, may indeed never be accomplished, but it is not a bad thing for China that all her educated men have been trained religiously to believe in it.

American Highways

THE persistent rawness of American agriculture is seen nowhere else more than in the careless use which we make of our streets. Country highways are seldom anything more than drives between weeds that have their own way and scatter seeds on the adjacent farms. Near the house these driveways are narrowed between brush piles, stone piles

and other waste. Where the barn stands at the roadside the drive is liable to be adorned with tools that lack storage, but badly need it. Consul R. J. Thompson, of Hannover, in Germany, reminds us of what we might make our streets, when he reports that the country roads in the township of Linden yielded this last year nearly five thousand dollars' worth of fruit, sold at auction for the public benefit. Along certain lines of roadway the cash value of the fruit per mile was five hundred and ninety-five dollars.

This is a sort of thrift that the average American farmer can hardly conceive. The province of Hannover has seven thousand miles of country roadway bordered with fruit trees, and otherwise these highways are ideally kept for travelers' enjoyment. The fruit, as well as the trees, belong to the public, not to be picked excepting by officials, and then the product is turned over to the auctioneer and the cash into the public treasury. Consul Thompson tells us that these public fruit trees are rarely meddled with, and watchmen on bicycles patrol the roads, particularly on Sunday, to guard against any possible thieving. It is even forbidden to pick up fruit from the ground; and to knock it off from the trees subjects the trespasser to a fine of one hundred marks, or nearly twenty-four dollars, for each offense.

The high price of fruit in America, and the increasing value of apples, makes it very desirable that the crop shall be increased, apart from the desirability of making our highways of economical value to the public treasury. Americans are not accustomed to a restricted use of the roadways, but we do not believe that apples growing along our roads would stand any more risk from the strolling boy or traveler than in European countries; but the tree itself would surely have to be protected more carefully when young. Our boys are not trained to a particular regard for street trees, and would be pretty sure to exhibit their skill in climbing. It would need, however, only cheap frameworks as guards; the Hannover policemen would not need to be repeated.

The value of the fruit obtained would easily match that reported by Consul Thompson, for we have now varieties

that are especially adapted to road culture, such as the Northern Spy, the Stayman's Winesap, the old Pound Sweet and the King David. Some of these varieties would be very much improved by growing where every decayed apple would be trampled underfoot or devoured. In this way the larvæ of infesting insects would be destroyed. But this is not the end of the story. Many of our apple trees make admirable shade, notably the varieties we have named. The Greenings and Pippins and Spitzenburgs mainly droop too much and when bearing would be in the way. A capital list of about one dozen varieties, adaptable to any section of the country from Minnesota to Georgia, could be selected. If planted near towns, or along the streets of towns, even cities, the pavements would be vastly improved by shade. Economically the matter works well every way. As we are sure to increase our Telford pavements, wherever the automobile can run, we may welcome these preservatives along the street sides. Road engineers are laying emphasis on this matter just now, assuring us that trees will lengthen the life of a pavement many fold, wherever they hinder the full heat of noonday.

All this time we are planting windbreaks, and this is becoming a matter of vital importance to good farming. The removal of forests has gone to the extent of making our climate very unstable. Farmers are beginning to understand the importance of a shelter to prevent the winds from sweeping the moisture from their corn lands and meadows. The orchardist knows that he cannot grow apples successfully when the northwesterers are free to tear off his maturing crop. If all our streets could be lined with thick-limbed shade trees, like sugar maple and white ash, it would add millions of dollars to the adjacent crops; but among all our trees there are no better windbreaks, as there are no better shade trees, than those which give us fruit—notably pears and apples.

The argument is just as strong, if we consider nothing more than the advantage to the young people of growing up with a consideration for law and order. Our country is civilized just about in proportion as the street is civilized.

Beauty and utility must always go on together. Our gardens must extend over the highway. The beautiful must include the whole scenery. There is no good reason for leaving our American streets out from the protection of law, or giving them over to roughage and neglect. The Germans have set us a good example in making the street pay its own bills. Pave them with apples; or, what is the same thing, with what the apples bring in market.

According to the Public Roads Office at Washington the United States expended about one hundred and forty millions on road improvement during the year ending June 30, 1911, over one hundred millions coming from local revenues. It is probable that the whole of this sum could have been raised without any taxation whatever. If a single German township can take five thousand dollars' worth of fruit from public trees we can do equally well in this country. The fact that a good deal of the money expended is practically wasted on tinkering unmade roads emphasizes our argument. Niggardly habits of road making come mainly from the fact that the people feel the burden of taxation.

During his visit to the United States from 1868 to 1873 Justin McCarthy held the desk of editor of the department of book reviews for THE INDEPENDENT. On his return to England he devoted himself to the cause of Irish home rule, and was Mr. Parnell's first lieutenant while Mr. Gladstone's two bills were before Parliament; and after Mr. Parnell's death Mr. McCarthy was the acknowledged leader of the Irish party in the House of Commons. With advancing age and loss of eyesight, he withdrew from active participation in public life, and our readers have enjoyed his frequent letters to this journal. But that was in his last years. Meanwhile he had acted as editor of two London papers that served the Liberal party, *The Star* and *The Daily News*, and published novels and also the "History of the Four Georges" and the "History of Our Own Times." His literary activity was prodigious. The story is told that while in

this country he offered to *Harper's Monthly* a story that so much pleased the editor that he asked Mr. McCarthy to write others. "How many?" he asked. "Why, fifty," was the reply. Mr. McCarthy took the editor at his word, and not long after dropt half a hundred stories into his astonished hands, which were accepted and paid for. He was a man of wide knowledge and sound judgment; and while he satisfied his Irish followers he never lost the respect and

THE LATE JUSTIN MCCARTHY
Our London Correspondent

regard of his Parliamentary associates who opposed his labor for Irish home rule.

We are very glad that the **Mr. Ismay** first suspicion that Mr. Ismay, chairman of the White Star Corporation, crowded himself into a boat to escape from the "Titanic" is not substantiated by the testimony. He declared that he entered the last boat when there was not a woman or child to be seen on the deck, and the witnesses who survive support his statement. They

tell that he took pains to see that room was made for a stewardess, and then, after having helped with the other boats and embarking the passengers he took the last chance. Considering him as an ordinary male passenger, there is so far nothing to his discredit. But in an extraordinary and really solemn and weighty letter to the New York *Evening Post*, Admiral Mahan declares that he was not an ordinary passenger. He was the head and manager of the company. The boat was built under his direction. He was responsible more than any other man for its equipment. If it did not have lifeboats enough to hold the passengers it was his neglect. If it was allowed to speed at a dangerous rate amid icebergs it was his doing. It was in a boat thus equipt and thus speeded that passengers were induced to sail, assured that it was unsinkable. Under these circumstances, says Admiral Mahan, it was the duty of Mr. Ismay to put every man, as well as every woman, whom he had invited to go on the ship with the assurance that it was unsinkable, into the boats, and save every one of them before he saved himself; for it was his negligence or his ignorance, certainly his persuasion and assurance, that brought them there. It is not easy for us to convince ourselves that Admiral Mahan is wrong. It can only be said that while the women were being put in the boats he acted well, and that he did not think the vessel could sink. He did not think. It is unfortunate, even criminal, we fear, that he did not think. But we have learned that evil is wrought by want of thought as well as by want of heart. The managers of all the steamship companies are thinking now. He thought it would be safe to plow right thru an icefield, but what he thought served him no better than what Tomlinson thought in life served Tomlinson's ghost at Heaven's gate, for all he and his directors and those of other equally guilty steamship companies have thought and believed it safe to do and not to do:

"And the faith ye share with Berkeley Square uphold you, Tomlinson."

It is all the support he can have, that he thought amiss with a multitude of others.

The People's Institute We congratulate the People's Institute, of this city in selecting as its director Mr. Fred-eric C. Howe. Ever since the untimely death of Charles Sprague Smith two years ago, the trustees of the institute have been unable to hit upon just the right man to fill the vacancy till now. Mr. Howe is a graduate of Allegheny College and Johns Hopkins University, and a lawyer by profession. He served as a member of the City Council of Cleveland in 1901-03, and as a member of the Ohio Senate in 1906-09. In 1904 he was a special commissioner of the United States to investigate municipal ownership in England. Mr. Howe has lectured and written much on municipal problems, his best known book being perhaps "The City, the Hope of Democracy." Our readers will remember some of his writings in our columns. We are confident that the People's Institute, which has ever stood for progressive leadership, good government and right thinking and living under the inspiring and resourceful leadership of Charles Sprague Smith, will continue one of the great moral forces of the land under Dr. Howe.

The Men and Religion Movement

The series of meetings under the name of the Men and Religion Movement have come to an end, and they have proved the introduction of a new sort of force for united Christian service. In the days of a generation or two ago a single church would invite a noted evangelist to conduct revival meetings, and a revival would be looked for once in perhaps seven years. Then followed united meetings of the same sort, but embracing all the churches of all denominations in a town or city; and a great effort would be made to secure accessions to the churches. This did much to break down the sectarian walls and discourage pious rivalries. Then came the organization of the Federation of Churches, which has encouraged and developed such efforts as this of the Men and Religion Movement, which not only embraces all the denominations, but spreads its meetings all over the country. But

what is remarkable and most peculiar about it is, that it has not given itself, like the earlier efforts, to specific evangelization, to the counting of converts, but to social service, to the betterment of the community and the eradication of social evils. It has tried to wake men up to the need of cleansing the morals of our towns and cities, and breaking up the pests that corrupt and ruin our boys and girls. We have heard the speakers criticised because they do not talk enough about the old Gospel, or because they even express satisfaction in the conclusions of critical scholars; but theirs is an effective way of saving our youth, and quite as good, as it keeps young people out of vicious and hostile influences, and makes them amenable to those ordinary influences which draw our youth into the Church before they are one and twenty. We believe this "conservation" work will prove continuous, thru committees that will study the forces of evil as well as of good, and will ally themselves with not a few less definitely religious organizations which are seeking a kindred end.

Amending the Catechism

We may expect something to wonder at when the committee at work four years on the revision of the Assembly's Shorter Catechism reports this month to the Presbyterian General Assembly at Pittsburgh. They propose to put the Catechism into modern language and yet not change its substance. Then it will retain not a little that Presbyterians are not agreed upon or interested in. What will they do with the very first question, "What is man's chief end?" with the answer, "Man's chief end is to glorify God and enjoy Him forever." That is two ends; which is the chief? Was it the chief end for which God created man, that God might get glory? We doubt. Or should it be man's chief end to increase the glory of God? That is not clear. We know that it is not the chief end for which many good Christians consciously labor. Or is it man's chief end to enjoy God forever? That is even less clear. Certainly it does not agree with an old dictum that a man should be willing to be damned

for the glory of God. John Lord, the lecturer on history, when at his examination for ordination some seventy years ago he was asked this Hopkinsian question, whether he was willing to be damned for the glory of God, answered, "No; but I am willing you should be." To make the chief end of man eternal enjoyment has a hedonistic sound which touches on the Epicurean philosophy. We wait to see the committee's report, and we shall look with especial interest for the answer to the question, "What is original sin?" Was Adam a historical character, and is it to be still taught that "we sinned in him and fell with him in his first transgression"?

The automobile has been crowding the horse for some time, and now the legumes are said to be trenching decidedly on the functions of the cow. In other words, milk and butter and even cheese are being made from the soja bean. This legume, which really is not a bean at all, but a sort of pea, has for some time been of high rank as a fodder plant, and specially valued in the Southern States. It has been found to be nearly as adaptable to the Northern States, and possibly well up into New England. By crushing and grinding and pressing a milk is obtained, which is pronounced to be exceedingly palatable in the fresh state, and like ordinary milk, it can be condensed. The novelty is all the more when we find that this vegetable milk can be used exactly like the cow's milk for making butter and cheese. It has already become very popular in Japan and China, from which countries we first obtained this remarkable legume. The growing of beans is certainly less troublesome than the care of a dairy of cows, and the experiment is worth a trial among those who believe in vegetarianism.

On the occasion of the fiftieth anniversary of the Cunard line of steamers they boasted with worthy pride that they had never lost a passenger by a naval accident; and the boast has been lately repeated. It may be true, and it is greatly to the credit of the owners and managers. But how is it about the crew?

Did not the "Umbria" leave Liverpool some years ago with her forward ventilators unshipped, and in a gale of wind? As we remember the storm grew heavier and the sailors were called to ship—that is, to set in place—the big ventilators, so that the water would not rush in and drown the steerage passengers and the watch below. It is very hard work. A great wave broke over the vessel and the whole watch, fifty to a hundred sailors, were suddenly washed overboard and lost. Even sailors' lives are of value—to them.

Who had heard of the good work which Mr. and Mrs. Isidor Straus had done for the Jews in the poorer quarters of Jerusalem during their late visit there? The first we had heard of it came with the despatch saying that 60,000 Jews in Jerusalem had held a solemn fast from food of a whole day in respect for their memory as soon as they heard of their loss on the "Titanic." When Mrs. Straus observed the misery and squalor of many of them she called her husband's attention to it, and he immediately established a soup kitchen for their relief.

How the bill introduced into the Senate, which would give independence to the Philippines in ten years, strikes fair critics in the East appears in the following comment from *The Japan Mail*:

"We firmly believe that in the event of the bill becoming law, the names of the framers of the bill would be handed down with execration and not with praise. For disaster and nothing but disaster, must inevitably be the result of such a dangerous venture. One is inclined to believe that the proposers of such a bill are acting from the selfish and narrow outlook of curtailing responsibility—that to put it bluntly, they are afraid of their country planting its feet too firmly in the Pacific and thus bringing trouble to their native shores."

Having given conspicuous and liberal space to an article by the "Marquise de Fontenoy" declaring that Cardinals are "princes of the blood" and must hold a higher place at functions than Governors and Ambassadors, *The Pilot*, owned by Cardinal O'Connell, now gives equal space again to an argument by another writer supporting the claim. Decent

Catholics are disgusted at such urgency of precedence. We cannot imagine Cardinal McCloskey or Cardinal Gibbons pressing such claims for himself.

The proposition that the United Presbyterian Church, which has its strength in Pennsylvania, should unite with the Southern Presbyterian Church is an admirable one. The two are stringently orthodox. Heresy has no place in them. They are Calvinistic to the core. That was not the case in the union of the Northern Presbyterian Church with the Cumberland Church, for the latter was distinctly not Calvinistic. We like the union of a Church in the North with one in the South, hoping that some years later the two great branches may unite.

The chief cities of Switzerland have crematories, usually owned by the city, and which are fast displacing cemeteries. Of 535 persons who died in St. Gall in 1911, 201 were cremated, an increase of 12 per cent. in cremations over previous years. This particular crematory belongs to a company which has a membership of 3,541 in a city of only 40,000 inhabitants, and the dues are but 40 cents a year, and the expenses of cremation are \$22.

"Engineers all perished" was one brief sentence posted at Lloyds, in London, after the "Titanic" went to the bottom. They it were who kept the lights of the ill-fated ship burning to the last. Theirs was a heroism of which we know nothing but the bare fact. In the bowels of their ship, where their duty held them, they refused the chance to live at the expense of those who had a fighting chance above. They perished—but gloriously.

We are not sure but the most unpleasant item in the very unpleasant conflict between President Taft and his predecessor in office is that in which Mr. Roosevelt, referring to the fact that he had given his full influence to the nomination and election of Mr. Taft, says that it is not decent to bite the hand that feeds you. The canine figure is not a

courteous one; and, so far as the world knows, Mr. Taft was not the first to bite.

We do not learn from the names of the passengers on the "Titanic" that any Protestant minister was in the list. But there were two Catholic priests, Thomas Byles and Joseph Kessler, and they did their duty faithfully, comforting the passengers, hearing confessions, giving absolution, and offering prayer until they perished, for they did not flee the ship. They deserve their full meed of honor.

We are pleased to learn that Major Butt went to Rome with no message whatever from President Taft to the Pope; none of thanks for the appointment of three American Cardinals, none of request for more Cardinals, and particularly none for the settlement of the rank of Cardinals at public ceremonials. The last was quite too absurd to be suggested.

The article by our sailor friend, James H. Williams, impresses strongly that lesson by the "Titanic" disaster which we spoke of last week, the need of supplying our passenger vessels with a good supply of trained seamen, men that really know the water as well as the coal bunkers. They can be had if fairly paid.

The strike of firemen and sailors on the "Olympic," at Liverpool, because they thought the collapsible boats bought in a hurry old and rotten, had the remarkable effect of compelling the company to abandon the trip. Hereafter the seamen's union will very properly claim the right to see that the lifeboats are in safe condition.

Did Tennyson anticipate the coal strike? Attention is called to these lines from "Locksley Hall":

"Slowly comes a hungry people, as a lion,
creeping nigher,
glares at one that nods and winks behind a
slowly dying fire"

Senator John Sharp Williams, of Mississippi, did himself no credit by repeating in the Senate last Friday a profane parody on the Apostles' Creed meant to reflect on Mr. Roosevelt.

The New Building of the Bankers Trust Company

THE new home of the Bankers Trust Company was opened on May 1. It is the highest banking building in the world, 540 feet from the sidewalk to the top of the roof. Including the six stories in the pyramid and the four basements, it has forty-one stories. The roof is a unique type of architecture, never before used. The pyramid itself is 94 feet high, and contains the water tanks for the automatic sprinklers and fireproof storage rooms. The vault in the basement weighs 1,550 tons, the main door alone weighing 40 tons. The vault will accommodate 160 safes.

In August, 1911, the Mercantile Trust Company was merged with the Bankers Trust Company, and the capital increased from \$3,000,000 to \$5,000,000. The statement of the Bankers Trust Company for March, 1912, shows total resources of \$174,239,769. The surplus is \$10,000,000, the undivided profits \$3,183,419, and the total deposits \$149,726,068.

These figures reflect a remarkable growth, when it is considered that the Bankers Trust Company was started only nine years ago. It was organized in 1903 with a capital of \$1,000,000, by representatives of large banks and banking institutions in New York and other cities. In June, 1911, before the merger, the Bankers Trust Company had aggregate resources of \$109,085,727, with deposits of \$94,062,531, while its capital, surplus and undivided profits amounted to \$9,929,868.

Three general departments are maintained by the Bankers Trust Company. The bank department accepts deposits, subject to check, and pays interest on balances of \$1,000 and over. The trust department acts as executor and trustee under wills, and carries on the usual business in connection with trust funds. The foreign department buys and sells foreign exchange and issues travelers'

letters of credit. This department also handles the American Bankers' Association travelers' checks.

The company's officers are E. C. Converse, president; B. Strong, Jr., vice-president; W. C. Poillon, vice-president; D. E. Pomeroy, vice-president; H. B. Thorne, vice-president; F. N. B. Close, secretary; G. W. Benton, treasurer; G. Richards, assistant secretary; H. W. Donovan, assistant treasurer; B. W. Jones, assistant secretary; H. F. Wilson, Jr., assistant secretary; R. H. Giles, assistant treasurer; H. N. Dunham, assistant treasurer; I. Michaels, trust officer.

Alabama Currency Platform

THE Democrats of Alabama in their recent convention, which gave the support of the State to Oscar W. Underwood, as a candidate for the Presidential nomination, placed in their platform the following currency plank:

"We believe that the honest farming, business and working classes of the country could be largely relieved from panics and consequent unemployment by a Democratic revision and codification of our antiquated banking laws, which would create an elastic banking system and preserve our independent banks from any dominant financial or political control."

John V. Farwell, of Chicago, prominent in the National Citizens' League, an organization designed to promote currency reform, expresses approval of this plank. It may have been written by Mr. Underwood, who has not been in sympathy with Mr. Bryan or with certain other Democrats who insisted upon a very broad and deep investigation of what they called the Money Trust. But there is at present no indication that the element represented by Mr. Underwood will write the currency plank in the new national platform. The House, on the 25th, by a vote of 237 to 15, adopted a resolution greatly broadening the scope of the Money Trust investigation, and the committee has employed as counsel Mr. Untermeyer, whose charges as to

THE BANKERS TRUST COMPANY BUILDING
On the corner of Wall and Nassau streets, New York

the existence of such a Trust have been substantially in accord with those of Mr. Henry and Mr. Lindbergh, who demanded a drastic and comprehensive inquiry.

....The State of New York will receive more than \$5,000,000 in inheritance taxes from the estates of victims of the "Titanic" disaster. It is estimated that at least \$4,000,000 will be paid by the Astor estate.

....Exports of copper and copper manufactures in the current fiscal year will amount to about \$110,000,000, against \$43,800,000 in 1902, and \$13,000,000 in 1892.

....Banks holding special deposits of Government funds must hereafter pay 2 per cent. interest, instead of 1 per cent. At present the deposits amount to a little more than \$34,000,000, held by about 1,000 banks.

The "Titanic" Loss

FROM the insurance viewpoint the "Titanic" disaster is of interest principally to the companies providing life and accident protection. Aside from the feature of running the vessel at undiminished speed thru the ice fields of the Atlantic, the misfortune presents nothing of unusual interest to marine underwriters, whose losses, tho extremely heavy, are due to causes fairly within the province in which they operate. But with proper equipment the lives of the passengers and crew could have been saved.

An estimate based on inquiries among the insurance companies puts the total life insurance loss at \$2,193,000, and the accident insurance loss at \$2,213,000. As most of this protection was carried by passengers in the first and second cabins, of whom 315 lost their lives, and as it is all but a certainty that the average insurance on each of these was not less than \$10,000, it is plain that the adults among the remaining 1,280 left nothing in that shape to their dependents. Assuming that 1,000 of them should have carried \$1,000 life insurance apiece, and that the first and second class passengers could have afforded \$10,000 each, the total life insurance involved in this disaster should have been not less than \$4,150,000.

Some of the larger life and casualty companies have been interesting themselves of late in the cause of conservation. This occurrence indicates that they have overlooked a most important field. It now develops that every marine passenger line is woefully deficient in life-saving equipment, and it may be worth the life and casualty companies' attention to hereafter keep that matter under surveillance.

THE Aetna Life Insurance Company of Hartford is about to issue a work entitled "The Business of Insurance," in three volumes, of about 500 pages each. The work is divided into eighty chapters, each one written by an emi-

nent authority and each destined to exhaust the subject covered. The experts would seem to represent all the best companies in existence. The general subjects include History of Insurance, Policies, Premium Rates, Settlement of Losses, Home Office Management, Agency Management, Inspections, Medical Examinations, Co-insurance, and Commercial, Assessment, Fraternal, Mutual, etc., Insurance. Howard P. Dunham, of the Aetna, has compiled the work, which will be published by the Ronald Press Company, of New York City.

AN announcement has been made of the proposed organization of a new insurance company, to be called the Atlantic Fire Insurance Company of New York. The company will have a capital of \$200,000, divided into 2,000 shares of \$100 each. The head office of the company will be in New York. The organization committee consists of H. S. Wilson and T. A. Duffey, of New York, and Thomas Baker, of London, Canada. The address of the committee is 55 John street, New York.

J. W. SKINNER, first vice-president of the Northwestern Mutual Life Insurance Company, died April 18, from a stroke of paralysis. He was seventy-four years old and had been in the service of the company forty-seven years. He was elected first vice-president in 1908.

A CHICAGO woman, the head of the Boston Store, holds a larger amount of life insurance than any other person of her sex: \$1,200,000. Since the death of Marshall Field, no resident of Chicago has, it is said, carried so large an amount.

THE estate of the late Paul Morton, who was president of the Equitable Life from 1905 to his death in January, 1911, has been appraised at \$1,201,480, all personalty. His widow is the sole beneficiary.

The Independent

VOL. LXXII

NEW YORK, THURSDAY, MAY 9, 1912

No. 3310

Survey of the World

The "Titanic" Investigations

The concluding hearings in the "Titanic" investigation were held last week, in New York, and were chiefly devoted to an attempt to trace the false rumors and so-called "wireless" messages circulated after the steamship had met with the fatal collision. J. Bruce Ismay and the members of the White Star liner's crew who had been detained have now returned to England. The "Titanic's" appeal for assistance might have been heard by other nearby steamers but for the fact that these were busy with routine business, and their instruments adjusted for long-distance waves. At night the liners receive stock reports and general news, which is printed on board for the benefit of passengers.—Victims of the "Titanic" disaster whose bodies were recovered by the cable steamship "Mackay-Bennett" have been buried, variously, at sea, at Halifax, at New York and elsewhere. The cable steamship "Minia" has continued the search for bodies. The "Mackay-Bennett" brought 190 bodies to Halifax. No bodies found contained any bullet wounds.—The British inquiry into the loss of the "Titanic" was begun on May 2, at London. The Seafarers' Union will be represented at the hearings.—The seamen of the "Olympic," who left that steamship just before her hour of departure from Southampton for New York, were arraigned at Portsmouth on April 30 on a charge of mutiny. On May 4 they were discharged from custody; the charge was proved, said the court, but punishment was "inexpedient, in view of the peculiar circumstances."—The Hydrographic Office of the United States Navy Department published on May 4 an account of the sinking of an unknown

steamship last week in circumstances like those of the "Titanic." The steamship was sunk in latitude 45 degrees 50 minutes, longitude 54 degrees 10 minutes, according to Captain Hoie, of the "Romsdal," a Norwegian vessel.

✱
National Politics The canvass for the Republican Presidential nomination was marked, last week, by much bitterness in the public addresses of Mr. Taft and Mr. Roosevelt, and an exchange of sharp personalities by the friends of the two competitors. With respect to the action of the Roosevelt Administration concerning the Harvester Trust, Mr. Taft insisted that he had had no knowledge of it, and Mr. Roosevelt repeated his assertion that it had been approved by Mr. Taft. This controversy caused a division of the Roosevelt Cabinet, Mr. Root and Mr. Wilson supporting Mr. Taft. Ex-Attorney-General Bonaparte remarked that Mr. Taft was no longer worthy to hold office. George W. Perkins published a long statement, showing that he had contributed large sums for the campaigns of Mr. Bannard, Mr. Taft and Mr. Stimson, and that at the end of the national campaign of 1908 he had made good the campaign committee's deficit of \$15,000 by a loan which had not yet been repaid. His argument was that his support could not have been less objectionable then, as he was more closely identified with Mr. Morgan and certain Trust interests than he is now, when his money is given to aid Mr. Roosevelt. The publication of the Harvester Trust correspondence, he asserted, was "a scurrilous attack" upon the ex-President. He called for all the correspondence, and spoke of the dissolution

of the Standard Oil and Tobacco Trusts as having brought "increased profits to inside stockholders and increased cost to outside consumers." There was a vigorous campaign immediately preceding the primaries held in Massachusetts on the 30th, Mr. Taft and Mr. Roosevelt making many addresses. Mr. Taft said that if the Presidential term were six years, with no re-election, a President would not be compelled to go on the stump and defend himself against gross misrepresentation. Mr. Roosevelt insisted that the President was supported mainly by bosses, and that his course was marked by flabby indecision and helpless acquiescence in the wrongdoing of crooked men. The vote showed nearly an even division. While Mr. Taft had a popular majority of about 3,600, the eight Roosevelt delegates at large were elected, owing to the rejection of many Taft ballots. These were defective because an independent candidate's name had been added to the list and votes had been cast for nine instead of eight. Mr. Roosevelt promptly declined to take advantage of these errors and urged the elected delegates at large to support Mr. Taft, who, if they do so, will have 26 of the State's 36 votes. There is a movement for a recount. Mr. Clark was the voters' choice on the Democratic side. At the Republican convention in Pennsylvania, Senator Penrose was dislodged, and the dominant influence was that of William Flinn, of Pittsburgh, the Roosevelt leader. The convention adopted a progressive platform, in which no mention of President Taft or of his administration is made. This platform calls for direct election of United States Senators, direct nomination of all elective officers, Presidential preference primaries, a strict and severe corrupt practices act, a workmen's compensation law, and legislation to decentralize control of currency and credit. When statutes for social and economic justice, it says, are declared unconstitutional by the courts, the people should have the right to say whether they want the statutes to be law. There was a sharp contest preceding the primaries in Maryland, where Mr. Taft and Mr. Roosevelt repeated the assertions they had made in Massachusetts. On the morning of the

6th, Mr. Roosevelt published a long statement aimed at the President. Mr. Taft, he said, had not only been present at a Cabinet discussion of the Harvester Trust case, but also had repeatedly and emphatically in private conversation approved the course actually taken. It was "utterly impossible" that Mr. Taft should have forgotten this. "It is impossible," he continued, "to reconcile his present position with any standard of honorable conduct." Mr. Taft had asserted that he (Mr. Roosevelt) had said the Anti-Trust law ought to be repealed, well knowing that this was not true. Mr. Taft's conduct with respect to the Standard Oil and Tobacco Trust cases was incompatible with any sincere purpose to enforce the law. Mr. Taft knew well that delegates elected for him in Kentucky, Indiana, New York City and elsewhere represented barefaced frauds. "He stands guilty of connivance at and condonation of these frauds; he stands guilty of approving and encouraging fraud which deprives the people of their right to express their will."

The information obtained by Congress the Department of Justice concerning the foundation of charges against Judge Robert W. Archbald, of the Commerce Court, has been sent by the President to the House Judiciary Committee, the President advising that it be withheld from the public until after the committee has thoroly sifted it. The charges relate to the purchase and sale of culm bank properties in Pennsylvania which were controlled by a railroad company. It is expected in Washington that Judge Archbald will be impeached. —The House Committee on Appropriations has shown its desire to abolish the Commerce Court by withholding an appropriation for the maintenance of it. —In conference, last week, a compromise service pension bill was accepted. It is estimated that this bill, if enacted, will increase pension expenditures by \$25,000,000 a year. —The Sulzer bill, designed to improve the diplomatic and consular services by means of examinations for entrance and promotion, has been reported favorably in the House. The passage of it is expected. —By a vote that was almost unanimous the

House placed in the post office appropriation bill a provision for testing a parcels post system on rural routes. The limit of weight is to be 11 pounds, and the charges will be 5 cents for the first pound, with 1 cent for each pound in addition.—An investigation of the campaign contributions and expenditures in 1904 and 1908 has been ordered by the Senate.—Attacking the bill for a Federal Department or Bureau of Health, on the 29th ult., Senator Works warmly defended Christian Science healing.—Owing to sharp criticism by clergymen and others of his recitation in the Senate of a parody of the Apostles' Creed, aimed at Mr. Roosevelt, Mr. Williams, of Mississippi, has ordered that the objectionable passage be stricken from his speech in the permanent copies of the *Congressional Record*.

Trust Cases At St. Paul, Minn., on the 30th, the Government began to prosecute the International Harvester Company, or Harvester Trust, by filing a petition in equity, asking for a dissolution of the corporation and alleging that it exists and does business in violation of the Sherman act. This suit followed closely the end of conferences or negotiations for a dissolution without litigation. The Government alleges that the company controls 90 per cent. of the harvester trade, 75 per cent. of the trade in mowing machines, and is seeking to monopolize the production of all kinds of agricultural implements; that it has absorbed competing companies, afterward pretending that these were still independent, and that it has used unfair methods in its business. The company's capital is \$140,000,000. One of the defendants is George W. Perkins.—It is reported that the Government will soon sue for the dissolution of the National Packing Company, a corporation alleged to be the agency by which the great beef companies act in combination agreement.—The Standard Oil Company of Indiana has asked for a modification of the recent judgment of expulsion from Missouri by the Supreme Court of that State, offering to pay costs and a fine of \$50,000, and promising to obey the State Anti-Trust law.

Labor Questions The engineers of the Eastern railroads reached an agreement with the companies, providing for arbitration by a board of seven men, one to be chosen by the engineers, one by the companies, and the remaining five by these two. If the board be not completed within fifteen days, the vacancies are to be filled by the Chief Justice of the national Supreme Court, the presiding Judge of the Commerce Court, and the Commissioner of Labor, these three acting in concert. The second and third are Judge Knapp and Commissioner Neill, by whose friendly intervention a strike was averted. The men have selected P. H. Morrissey, formerly the head of a trainmen's union, and the companies' choice is Daniel Willard, president of the Baltimore & Ohio.—Negotiations for a settlement of the controversy in the anthracite coal industry have been broken off, the men rejecting the terms offered by the coal railroad companies. The proposed wage increase of 10 per cent. amounts, they say, to only 5½ per cent., owing to the accompanying abolition of the sliding scale. A convention of the union is to be held on the 14th to deal with the situation.—Publication of the Chicago daily papers has been seriously affected by a strike of the pressmen, followed by a strike of the stereotypers.—The firemen on the Eastern railroads, following the example of the engineers, have demanded a wage increase which would amount, it is estimated, to about \$25,000,000 a year.

The Islands W. Cameron Forbes, Governor General of the Philippines, who is now in this country, says that under the stimulus of free trade with the States an upward movement in the islands has begun. They are paying from revenue all the expenses of administration, and have each year a comfortable balance for public improvements. Progress in sanitation has made Manila a healthful city.—At Washington, the Republican minority of the House Committee on Insular Affairs has submitted a report against the pending bill which gives independence to the Philippines in 1922. Enact-

ment of the bill, they say, would "increase rather than lessen our responsibility, while lessening our ability to perform our moral and just obligations. It would be a cowardly shirking of our duty, a disgrace to the American people, and an injury to the Filipinos, to give them self-government before they are fitted for it."

"The inhabitants of the islands do not constitute a homogeneous people. They are composed of many different tribes, some styled as civilized and some admittedly wholly wild. There are some fifteen or twenty different languages or dialects spoken. In many instances those who speak one dialect cannot speak or understand any other. Only about 10 per cent. of all the people can read and write in any language or dialect, and less than 3 per cent. possess what we would call a fair common-school education. Of the entire 8,000,000, less than 2½ per cent., or about 200,000, have been found qualified to vote under existing laws. A few of these, chiefly among the Tagalogs, are very well educated. A smaller number are ambitious to govern, and they have no difficulty in stirring up a very considerable popular sentiment in favor of entire independence. There are, on the other hand, many who privately, if not publicly, look with fear and disfavor upon such a prospect."

—A strike of stevedores for higher pay has tied up all traffic in the harbor of Havana. The Federation of Labor in this country has promised to help them by calling out firemen, engineers and other employees on ships plying between New York and Havana, if strike-breakers are used there.—The revolt in the northern part of Santo Domingo has not been suppressed. News reports are affected by a rigid censorship.

At the end of last week Orozco **Mexico** was beginning to move his army southward, and a decisive battle was expected. He had about 6,000 men, and there were 8,000 Federals in opposition. Smallpox and typhoid fever had broken out in the Federal army. In a telegram to New York, Orozco said he had 12,000 men in Chihuahua and 40,000 in other parts of the country. Madero said he would never treat with Orozco, that he would not resign if the Federal army should be beaten, and that if the capital should be taken he would go to the mountains and fight as long as he lived. In the debate in the Mexican House accompanying the passage of a bill providing for an enlargement of the

army, Diaz was eulogized and the Madero Government called a failure. Emilio Vasquez Gomez was proclaimed provisional President at Juarez, which was made the rebel capital. Gomez appointed Orozco's father Minister of War. Congress attempted to appoint a committee with instructions to treat with the rebels for peace. Finding that the Constitution would not permit this, it instructed the committee to confer with Madero and urge him to make peace. Orozco sent an agent to Washington, to ask for recognition. Secretary Knox, passing through El Paso, refused to see delegates whose mission was the same. At Tepic, the rebels were repulsed, with a loss of 220 men. There was a two-day battle at a town in the State of Puebla with 2,500 Zapatists, and the result is not yet made known. Cuernavaca was menaced, but not captured. A. Z. and Joseph Rottner, Russian subjects, officers of a news company at Tampico, were deported as pernicious foreigners. For a year they had been selling arms to Zapata's bandit army. The transport "Bufort" started from San Francisco, on the 28th ult., to rescue stranded Americans on the west coast. The gunboat "Yorktown," while on her way to Topolobampo, was halted by destroyers and directed to avoid Mexican ports, in order that the people might not be excited by the visit of an American warship. At Washington there were conferences between officers of the regular army and militia commanders concerning a bill empowering the Government to add the militia to the army in emergencies and to use it outside of the United States.

In response to the re-
Magdalena Bay cent resolution, Mr. Taft sent to the Senate, on the 1st, a brief message, and a report of Secretary Knox, concerning Magdalena Bay. There was nothing on file in the Department, Mr. Knox said, to justify any inference that the Mexican Government or the Japanese Government had been "occupied with any disposition of land near Magdalena Bay, by which the latter Government would acquire land there for any purpose." Owing to rumors in circulation, the Japanese Ambassador had, with the authorization of

his Government, made an unreserved and categorical denial of the reported purchase of land by the Government or by a Japanese company, saying that his Government had never directly or indirectly attempted or contemplated the acquisition of any land at Magdalena Bay for any purpose. The rumors were due to the efforts of an American syndicate to sell land there to Japanese. The Department had informed the American owners that such a sale would be regretted by our Government, and no further action had been reported. In the debate concerning this message, Mr. Lodge said the time was opportune for a new declaration of the Monroe Doctrine, a declaration including colonization. There was a Japanese colony on the lands in question, and Japanese had made surveys of land not required in connection with the fishing concession which Japan had obtained. Other Senators express the opinion that acquisition of land and establishment of a coaling station in Magdalena Bay by a foreign nation would be almost equivalent to an act of war.

Central and South America In Nicaragua's plan of currency reform, devised by American experts, the unit will be a gold dollar, and the minor coins will be like those of the United States.—Thomas C. Dawson, resident diplomatic officer of the State Department, died in Washington, on the 1st, at the age of forty-six. He had been notably successful in dealing with difficult questions in Central and South America. Among the achievements of his diplomacy were the fiscal agreement with Santo Domingo, a treaty between Colombia and Venezuela, the settlement of the Alsop claim against Chili, and peace agreements affecting two or three Central American republics.—Venezuela's entire Cabinet resigned last week. Reasons for this action have not been published.—The President of Chili, recently deploring the ravages of yellow fever at a northern port of that country, intimated that he was about to ask our Government to lend him the services of sanitary experts who had done such excellent work in Cuba and Pan-

ama.—Representatives of both parties in Panama have asked our Government to safeguard the approaching election by supervising registration and voting.—Additional testimony and arguments have been heard at Washington for or against the pending bill which would exclude from the Panama Canal ships owned or controlled by railroad companies.

Great Britain and Ireland

The Home Rule bill has passed its first reading by a majority of 94, and all fear of a Liberal split, endangering its final passage by the House of Commons, is at an end. The question now is as to the Unionist policy in both branches of Parliament, and as to what amendments may be forced before the Lords finally accept the measure—probably after a preliminary rejection. Mr. Balfour has complained in the House of Commons that the Government has not answered any of the Opposition's criticisms of the bill, or elucidated its details. He is convinced, he says, that the Government would do great injury to the institutions of Great Britain and Ireland by establishing dual control of the latter country. A Nationalist convention held at Dublin on April 23, under the presidency of Mr. Redmond, leader of the party in the House of Commons, accepted the Government's bill as "the most satisfactory measure ever offered to Ireland." There was enthusiasm when the vote was taken, and when W. G. C. Gladstone, M. P., grandson of W. E. Gladstone, addressed the convention. Ulster's opposition remains as threatening as ever, and when the Home Rule bill passed its first reading in the House of Commons Mr. Bonar Law, the Opposition leader, declared that the Orangemen were ready to lay down their lives in what they believed to be the cause of liberty. Sir Edward Grey, the Foreign Secretary, says that if Ulster makes impossible the Government's solution of the home rule question,

"We cannot afford to continue the present state of affairs. . . . Some other solution must be found to free the Cabinet and the House of Commons and put the control of Irish affairs in Irish hands."

—The Welsh Church disestablishment

bill passed its first reading in the House of Commons, April 25, by a vote of 331 to 253.

Germany The division of the German fleet that will come to America to repay the visit which the second division of the United States Atlantic fleet paid at Kiel last summer will include the armored cruiser "Moltke," the protected cruisers "Stettin" and "Bremen." They will probably make their start early this month, returning in June. The ships will visit both Hampton Roads and New York. The report that the German Crown Prince will accompany the fleet is persistent.—In the debate in the Reichstag on military estimates, on April 24, reference was made to the recent duel between Lieutenant von Herringten, nephew of the Prussian War Minister, and Lieutenant von Puttkemner, in which the latter was killed. It was declared that the duel disgraced the nation. Herr von Herringten, in an agitated manner, protested against such criticism. He declared that the officer who refused to fight a duel on the ground of religious convictions was unworthy to wear the uniform. An angry outburst from the Catholic Center, Liberal, Radical and Socialist benches followed, and the War Minister could not make the rest of his remarks heard. Subsequently he tried to conciliate the Reichstag by a speech in which he confessed that duelling was an evil, tho he regarded its violent abolition as impossible. The Centrists will introduce a bill making duelling in the army a penal offense and involving immediate dismissal. - Duelling in the army is approved by the German Emperor, and since the Reichstag debate another duel of fatal consequences, a lieutenant falling in a contest with an army surgeon, has occurred at Rastatt, in Baden.—Except the Socialists, all the German parties favor the Government's proposed increase of fighting forces, but there is an apparently irreconcilable disagreement as to the method to be adopted in raising the necessary funds. Germany's thirteenth dreadnaught, the "Koenig Albert," was launched at Dantzig on April 27.—Six thousand workmen in the Hamburg shipyards went on

strike on April 30. This delays the launching of the Hamburg-American Company's steamship "Imperator," said to be larger than the ill-starred "Titanic."—The Kaiser's youngest son, Prince Joachim, has been matriculated at the Strasburg University. This is believed to be a bid for the good will of Alsace-Lorraine.

France The funeral of M. Jouin, the assistant chief of the Paris detective force, killed in combat with the late bandit Bonnot, occurred on April 29. Louis Lépine, the veteran Prefect of Police, delivered at the grave an appeal for the more severe punishment of criminals, protesting against the world-wide tendency to treat youthful wrongdoers leniently, on the ground that they were not responsible for their acts. "We must choose," he said, "between the sacrifice of the liberty of the criminal and the blood of men valiantly laboring for the protection of society." The Minister of the Interior, Jules Steeg, added that the time had come to cease surrounding "with a fantastic and terrifying aureole" the exploits of mere desperadoes. Paris was quiet on May Day, and the decreasing influence of the "C. G. T.," or General Labor Federation, was commented upon.—On May 4 the King of Spain gave an audience to the French Ambassador that is thought to have a bearing on the settlement of French and Spanish claims in Morocco. A military expedition sailed from Algeciras, Spain, having been ordered to Laraiche, Morocco, on May 1. Despatches from Casablanca, Morocco, state that a Moorish attack upon El Maaziz cost the French 7 killed, 7 missing and 31 wounded.

The Near East Since Turkey's reply to the European Powers, thanking them for their offer of mediation, and accepting it on condition of the maintenance of effective and integral sovereignty by Turkey in Tripoli, and the evacuation of that country by the Italians, there has been a renewal of hostilities in several quarters. Italy reports that 300 Turks have been killed in a battle at Lebda, Tripoli, only

eight Italians being killed and fifty-seven wounded in the capture of the Turkish position. Italy denies the report that the battleship "Re Umberto" has been driven on the rocks by a storm and sunk near Zuara, Tripoli. Another rumor circulated was to the effect that the Italian cruiser "Varese" was badly damaged and probably sunk in the bombardment of the Dardanelles; but this, too, is denied. That an Italian squadron had occupied Rhodes without opposition and had disembarked 8,000 men, was announced by the Italian Prime Minister in the Chamber of Deputies on May 4. This island has an area of 550 square miles and a population of 30,000, chiefly Greeks. The announcement was greeted by cheers and cries of "Long live the army and navy!" The island of Rhodes has been the scene of bitter warfare in ancient times and modern. The combatants in modern times have been the forces of Christendom and Moslemism. —An unconfirmed report from Vienna states that Italy projects the establishment of a kingdom in the archipelago, including Samos and Crete, where disorders continue. The crown would be offered, according to this rumor, to the Duke of the Abruzzi. —On April 29 the steamer "Texas," flying the American flag, but the property of a local company, left Smyrna for Salonika with 139 passengers and a cargo. When off Yenikale Fort, near the mouth of the Gulf of Smyrna, the ship touched a floating mine, which exploded and sank it. Many of the passengers, of whom only seventy were saved, were American, Greek and Russian pilgrims returning from the Holy Land. The American Ambassador at Constantinople, Mr. Rockhill, has asked the Turkish Government for information and the American consul at Smyrna has opened an inquiry. One report states that a shell from the Turkish fort caused the sinking of the steamship, which had apparently deviated from the proper channel. —At the moment when the restoration of the Campanile of St. Mark's at Venice was being celebrated by officials of Church and State, and the bells rang out from the great tower for the first time in nine years, it was reported from Constantinople that the dome of St. Sophia's, which dates from the sixth century, will collapse unless

more efficient steps are taken to preserve it.

Yuan Shi-kai read his first presidential message at the opening of the first session of the advisory council of the Chinese republic, at Peking, on April 29. Six thousand infantrymen with loaded rifles lined the streets thru which he drove to the old Senate House, and sharpshooters were posted on the roofs, while cavalrymen surrounded the President's carriage. Eighty of the 126 Councillors attended the session, all wearing Western costume. The President declared that the principles of the new Government must be the maintenance of internal order, the achievement of progress and the continuance of friendly relations with outside Powers. He was negotiating with the Powers interested in the Chinese loans for an increase of customs duties, the abolition of the provincial transit duty and the reduction of export duties. This would add about \$9,000,000 to the revenue. Reforms which he recommended include the increase of revenue from the salt tax, the improvement of land regulations, the unification of the currency, and the establishment of uniform weights and measures. The Government would reduce its military forces —a costly drain upon its resources. Religious freedom would be guaranteed. —The Chinese Government has asked the four-Power group to arrange a temporary loan of \$63,000,000 until December, \$21,000,000 to be furnished by June. The Ministers of the Powers have replied that the appointment of a financial comptroller would be an obligatory condition of such a loan, and this point has been referred to the Ministerial Council. —A cruiser, the "Fei Hung," was launched from the New York Shipbuilding Yards, near Philadelphia, on May 3. Miss Chang Yuyi, daughter of the Chinese Minister to the United States, acting as sponsor. The new vessel will be used as a training ship. —Dr Sun Yat-sen places the responsibility for the continuation of the opium curse upon the British Government, alleging that cultivation of the poppy in China cannot be stamped out until Great Britain "absolutely prohibits the sale of opium in her possessions," notably India.

A Movement: A Message: A Method

BY WILLIAM T. ELLIS

SECRETARY OF THE COMMISSION ON PUBLICITY OF THE MEN AND RELIGION FORWARD MOVEMENT.

THERE are all sorts of ways of judging the Men and Religion Forward Movement, which for seven months has been "sweeping over the land like a besom"—or at least raising as much dust as a besom. One popular American way is by the noise that has been created. Men and Religion has not done its work in a corner nor hidden its light under a bushel. Six huge scrap books, each three inches thick and its pages the size of a New York newspaper, are stacked in the New York headquarters, to tell by clippings and headlines a portion of what the press of the land has been saying about this latest development of the religious life of America. If publicity is success, then this movement has succeeded. Its best friends, however, are inclined to think that it had rather too much publicity at the outset, in the form of prophecy, and not enough publicity at the end, in connection with the Christian Conservation Congress, in which it culminated. The "Titanic" disaster was in part responsible for this latter, and the innate irreligion of the New York newspapers was doubtless another factor. The display advertising on the sporting pages of the New York daily newspapers for six weeks, and the "sky signs" along Broadway—which somebody has called the modern version of the prophet's "Ho Ye!"—made talk for the city of new sensations, and gave opportunity for many learned newspaper editorials upon the wisdom of the churches in spending their money for advertising space. Doubtless this unprecedented publicity was salutary in creating the impression thruout the country that there was "something doing" in religion. The masculine associations of the title of the movement also made a wholesome impression.

Judged strictly by its own preliminary claims, the Men and Religion Movement has not brought into the

churches those three million unchurched men about whom we heard so much a year ago. Most of them are still out of the churches. A few thousand additions of men and boys to the membership may be traced to the campaign. The figures given out at headquarters during the congress indicated that the "teams of experts" have delivered approximately 10,000 addresses, to 1,500,000 men, in some 7,000 meetings. About 70 cities were scenes of eight-day campaigns by these experts during the winter; and radiating from these there were more than 1,000 auxiliary campaigns, conducted by volunteer workers. This showing is an extraordinary one, and by it, so far as statistics go, the movement is willing to be judged.

Of these many cities visited, some have been deeply and apparently permanently affected. Others have scarcely been touched. The word "experts" as applied to the visitors has been rather unfortunate, for pastors have resented the idea of having a group of comparatively unknown men come to town to tell the churches how to do their work. In certain cases the community religious life has been definitely revitalized and solidified. Existing organizations that had a name to live, but were dead, have been revived. The specialists have in each city presented a definite program of suggestions for work by the religious forces of that city.

In the campaigns and among national workers, new leaders have been brought to the fore. The three conspicuous personages of the Men and Religion Movement have been Fred B. Smith, the campaign leader, who was an evangelist, pure and simple, when he went into this work, but who now stands as unequivocally for social service as any of his associates, has proved himself a leader of force and fearlessness. Without his vigorous personality there would

have been no Men and Religion campaign. Of the men on teams, the two outstanding personalities are Charles Stelzle, who had made his reputation as a church and labor leader, and as the head of the Social Service Department of the Presbyterian Church; and Raymond Robins, known, especially in Chicago, as a labor unionist and as a social agitator. He has borne a religious message of extraordinarily dramatic power, and has found general acceptance with the churches.

The possibilities of loyal "team work," developed in a sphere where individualism and jealousies were only less common than in theatrical circles, has been a distinct contribution to religious work by the movement. All over the country laymen have been aroused by the program presented and have welcomed the opportunity to give expression to their dormant zeal for social service and applied Christianity. Apparently the attitude of the business men has been, "This thing means business, and I am

for it." Tens of thousands of laymen have given real service in committee work, in connection with the campaign, and sums of money that may aggregate altogether a half million dollars.

The most definite of all the lines of departure which the Men and Religion Movement has graven upon its time is its definite program of service for a church, for a city, for a denomination. Wherever it has gone it has borne the fivefold message of Bible study, evangelism, social service, boys' work and missions. One detail of social service and evangelism called "community extension," which means meetings held in shops and factories and police stations and other unusual places, has been added to the campaigns, but this is scarcely a department by itself. The social service aspect of the work has generally made the strongest appeal, with the boys' work as second. Instead of there being rivalry amid these various messages, each has blended with the other, and all have proved practicable. The denomi-

THE CHRISTIAN CONSERVATION CONGRESS AT CARNEGIE HALL: THE PLATFORM

national brotherhoods have now adopted the five-fold program of the Men and Religion Movement. The symmetry of it appeals to the modern man, as no one particular phase of work could do.

The comprehensiveness of the Men and Religion work has been a vital contribution to the religious life of our time. While evangelists and social workers were railing at each other as inadequate, this movement gathered them both in and proved that true evangelism is social service and true social service is evangelism. The quick receptivity which the Churches accorded this comprehensive message made it clear to the observant that Christian work cannot run on a single track. The whole Church is interested in the whole work of the whole kingdom for the whole world. This was significantly revealed at the recent congress in New York, by the place which foreign missions held. Men who have been attending the magnificent missionary conventions that have been a notable feature of our modern religious life expected foreign missions to sound the high note of the congress. To everybody's surprise, the missionary sessions were among the tamest of all, partly because there was no new plea to be made, and partly because the presence and pull of the other aspects of Christian service had begotten in the delegates a passion of seeing things in their relationships. The congress will be remembered as a time when the diverse and often discordant interests of the Church were unified into one great message.

From an unexpected angle the Men and Religion Movement has given a powerful lift to the cause of Christian unity. It set before men a task which no one denomination could accomplish by itself. The laymen were forced to work together, which they were always quite willing to do, and when men get to working together for their own community in a real task of service, they were scarcely in a mood to magnify ecclesiastical and doctrinal differences. The Christian Conservation Congress in Carnegie Hall could be interpreted in its every session as a Christian unity convention. The waste and weakness of competitive Christian service were made to seem wicked.

From what has already been written, it is evident that the movement has been provocative of large views. Dealing with religious problems on the basis of city units, it gave to all interested men a fresh civic consciousness. It confronted them with big tasks, and without railing at the pettiness of much so-called church work, it afforded the men an enterprise worthy of their best powers. Apparently the laymen liked the bigness of this program. All unwittingly, the doom of parochialism has been sealed in America. Henceforth American men simply will not tolerate religious service in terms of parishes only. If I were a maker of tombstones, I would expect to find a market for one dated April, 1912, to put over the grave of the pestiferous parochialism which has palsied the power of the Gospel in the presence of great civic and national problems.

The survey idea has been made good form in religious circles by Men and Religion. The first activity in connection with every city campaign has been the making of a survey of social and religious conditions. A veritable passion for facts, as well as a scientific arrangement and use of those gathered, has marked the progress of Men and Religion. This is a radical innovation in American church life. It has introduced the scientific spirit into Christian work, while at the same time it has played havoc with dogmatism, for nowadays no man's opinion is worth anything, except it agree with the ascertained facts. This has begotten a new humility and a new teachableness.

A volume could be written of the experiences of the Men and Religion workers with local churches and entire communities which were wholly blind to the real conditions amid which they live. The pastor who could answer the simplest questions about his neighborhood was the exception rather than the rule. The very idea that he should be expected to know something about the number of saloons and places of amusement in his parish, and the earning capacity of his people, and the proportion of men and women attending his congregation, was rather bewildering to Mr. Average Minister. Apparently few men so much as keep count of the number of attend-

HOW THE MOVEMENT ADVERTISED ITSELF
The electric signs in Madison Square, New York

ants at their services.. A comparison between the book membership and the participants in the services is likewise not often made by local congregational authorities. That there has been a deal of blindness in handling religious problems has been made glaringly clear.

To their credit be it said that the churches have taken eager hold of the survey idea, which within a year has become a fixture in church life. The home mission boards have got together and are making a survey of their fields in the Far West. Theological seminaries, like McCormick, are introducing their students to the business of survey making. Presbyterians have made a survey of Chicago, and the charts that have resulted have been more eloquent than any fervid appeals. Graphic charts, by the way, have been the commonest of arguments with the Men and Religion teams.

The logical conclusion of this method of getting a rational and scientific body of data, before proceeding to make statements, is the system of commission reports presented to the Christian Conservation Congress in New York City, April 19 to 24. This is only a slight modification of the plan adopted by the Edinburgh Missionary Conference two years ago. About seventy-five specialists prepared reports upon evangelism—a vigorous document that deals frankly with the union revival meetings and the

professional revivalist; upon Bible study (I understand that divergent views here compel the commission to put out its report with individual significance to the chapters); upon the rural church; upon missions; upon social service; upon Christian unity; upon boys' work; and upon the relation of the press and the churches. This last is the most radical of the documents, and the only one actually based on widely gathered questionnaires. It is expected to mark an era in the adjustment of religious work to the agencies of publicity. It undertakes to write the epitaph of the "pulpit notice," as the commonest form of religious news in the daily press.

This congress sounded a clear crisis note; it sobered the rare company of real leaders who, to the number of thirteen hundred, gathered for the sessions, to face the unique conditions that today exist in America and the world. It set the churches to thinking in social terms, and unquestionably committed the Christianity of our time to what a decade ago was regarded as a fad of the few. Veteran convention goers declared that this congress soared higher and plowed deeper—if the mixed figure may be permitted—than any other religious conference in America of which they had knowledge. Its unconventional character was illustrated by Jane Addams's wonderful speech upon the social evil.

"Christianity and Governments" was treated by William J. Bryan and J. A. Macdonald. A prophet's mantle descended upon Mr. Macdonald and Dr. Newell Dwight Hillis upon the night of the memorial service for William T. Stead, when his place upon the program was reached. Ex-Governor Northen of Georgia and Booker T. Washington dealt with the negro question, and Captain Hobson with temperance. John Mitchell and E. A. Steiner treated the labor question and the immigrant. Dr. Talcott Williams, of the School of Journalism; George W. Coleman, Col. E. W. Halford and others treated the subject of the press and the churches. Bishop Greer, Archdeacon Madden, Bishop Anderson, Bishop Hendrix, Bishop Hoss—all were heard in more than perfunctory addresses, and upon the closing night Dr. J. H. Jowett preached a sermon upon "The Kingdom" that gathered up into exalted unity the message of the congress.

Looking back upon the winter and upon the congress, it is clear that Men and Religion has been a real movement. It has spoken a message and has provided a new and definite method of ministry. That the Churches are more alert to the times than many scoffers have thought has been made clear. The definiteness and reasonableness of the social service program announced has doubt-

less vitiated much of the Socialist party propaganda.

Now all that the movement has gained or done has been bequeathed to the Churches. The Committee of Ninety-seven has gone out of existence, as it promised to do from the first. Thus it has testified to the widely expressed conviction that the country has had enough of general religious "movements" for some time to come. It is time to give local congregations and the denominational organizations an opportunity to practice what they have learned.

Thoughtful men are now passing in review these general enterprises, and the judgment of some is that they are rather too costly and too irresponsible. They are not as closely supervised as denominational work, nor are they as representative and democratic as Church work should be. The feeling is widespread that all general movements that would appeal to the Churches should henceforth be viséd by the Federal Council of Churches, which organization is today itself on trial at the bar of efficiency erected by the Men and Religion Movement. Christian work must, in the new era of scientific activity created by this temporary agency, meet the test of practical efficiency. Judged by that test itself, Men and Religion has been a success.

SWARTHMORE, PA.

Longing

BY ARTHUR WALLACE PEACH

SOME for a scepter long
Some for a rose,
Some for the din of praise,
Some, a night's repose

Some for a wreath of fame,
Some for a kiss,
Some for the gold they deem
Brings perfect bliss.

Over the world we are
Dreamers of dreams,
Each with the great desire
His heart esteems.

Many the hearts who fail,
Long is the way,
Vainly they search who vow,
Vainly, who pray.

Wiser are they who seek
Love first of all,
Make her their guiding star,
Serve as her thrall.

Enduring is love, alone,
Thru human tears,
Faithful thru stress and trial—
Gladdening the years!

BRATTLEBORO, VT.

Japan Today.—II.

BY HAMILTON HOLT

[This is the second article that Mr. Holt, our managing editor, has written as a result of his recent trip to Japan. The series began two weeks ago and will conclude in our next issue with some of Mr. Holt's impressions of Korea and Manchuria and a discussion of Japan's foreign policy with special reference to the United States.—EDITOR.]

IN no country in the world is there more religious freedom than in Japan. Three religions flourish—Shintoism, Buddhism and Christianity. The latest statistics are as follows:

Shinto Shrines	162,442
Shinto Ministers	14,836
Buddhist Temples	71,927
Buddhist Priests	51,268

Christian Churches:

Roman Catholic	176
Greek	174
Protestant	1,132

Christian Ministers:

Roman Catholic	353
Greek	40
Protestant	1,494

Christian Communicants:

Roman Catholic	64,118
Greek	31,536
Protestant	75,608

Shintoism is the indigenous religion of Japan. Its foundation stones are loyalty, and the worship of ancestors, heroes and nature. Shintoism is the religion of the Emperor and consequently is favored by the Government. Its moral precepts are taught in the schools. Buddhism is too complicated to discuss here, but its central doctrine is the "unity of all life and the brotherhood of man," while its ideal is "life made glorious by self-conquest and exalted by boundless love and wisdom." A Japanese can be, and often is, an adherent of both Shintoism and Buddhism. Buddhism alone of all the world religions has never carried on its propaganda by the sword. It is now divided into a great number of sects. Of late it has witnessed a decided revival in Japan. Tho neither Shintoism nor Buddhism has the clear conception of a personal God that Christianity offers, the great man of noble character is held to

be the direct impersonation of the divine spirit.

Of course, a large part of our sight-seeing was visiting the shrines and temples, many of them beautiful beyond description. I can never forget the Shinto shrines in woodland glades, which no human being ever enters, "where the many gaze reverently thru the latticed windows into the twilight silence within, and where abide divinities and ghosts of noble men." Nor can I cease to remember the soft enchantment of the Buddhist temples—"the deep music of the great bells—the green peace of the gardens haunted by fearless things—doves that flutter down at call, fishes rising to be fed."

I shall be expected to say something about the present status of Christianity in Japan. Most travelers return from Japan either pro-missionary or anti-missionary. If they have made their headquarters—as perhaps most do—in Yokohama and Kobe, and mingled almost exclusively with the foreign business men, they are likely to take the anti-missionary point of view. They will not get an anti-missionary impression, however, if they spend most of their time among the Japanese, as I did. While it is true that Christianity is probably not keeping pace with the growth of population, Christian ethical standards have already permeated the nation and universally incorporated into the Japanese social system.

Acceptance of Christianity, as such, has hardly touched the upper and lower classes. It has its footing almost entirely in the middle class. The students, as with us, are considered especially susceptible to its appeal.

The two chief hindrances to the spread of Christianity, aside from world-wide causes, seem to be the present diversity and antagonisms of denominations, and the quite obvious discrepancy between Christian profession and practice. When Christian nations offer themselves as moral leaders, after the rapacity with which they have established themselves in the Orient, the educated Japanese is tempted to smile at the incongruity. That the missionaries themselves have their discouragements and crosses will be seen from the following quotation from the presidential address of Rev. D. B. Schneider, D. D., at the conference last year of the Federated Missions:

"While Christianity is making a little progress, other great forces like that of nationalism, the revival of Shintoism, the renewed activity of Buddhism, agnostic or anti-moral literature and practical materialism, that seem to work in deadly opposition to it, are gaining in strength. Moreover the passing of leadership into the hands of the Japanese Church is giving us missionaries a secondary place and to use a homely phrase, it is difficult 'to play second fiddle' enthusiastically. The encouragement also which we receive from the home land is not great. Japan, partly because of its small size and partly because of its advancement in civilization, does not appeal to the interest and sympathy of the Christian lands as do, for example, China, India and Africa, and the securing of the men and funds still needed here is specially difficult. More than this, a deep positive hindrance has come to Christian work in Japan thru the persistent and diabolical war talk that has gained currency in certain parts of America and we know not what may come yet. Also the more intimate knowledge which the Japanese people are gaining year by year of the moral and social conditions prevailing in the Christian West, and of the thought currents of the great universities does not constitute to them an unequivocal argument in favor of Christianity."

At the present moment the Government is agitating the question of whether there may not be a common basis on which Shintoism, Buddhism and Christianity can unite for moral ends. A conference has just been held, at the instigation of the Government, of the leading representatives of these three religions, and a tentative program for united action has been adopted. Tho in the early days of the present regime most educated men shunned religion as unworthy of a rational mind, now it is generally realized that morality derives its greatest

power from the sanction of religion. Hence the present movement for united action by the Government.

I now come to the supreme attribute of the Japanese people—their character. Concerning this there are many differences of opinion. Everyone in the Far East is either pro-Japanese or anti-Japanese. It is never considered necessary to consider a man pro-Chinese or anti-Chinese. This signifies, of course, that Japan dominates the Far Eastern situation, so whatever opinion one may express about the Japanese, a premium or discount is put upon it according to whether one is supposed to be a "pro" or an "anti." I admit, therefore, at once that I am pro-Japanese in my leanings, tho I think I am not blind to certain Japanese deficiencies, as the reader will see later on.

I believe that President Scherer has made the best analysis of Japanese character when he says:

"The five fundamental perfected qualities that account for the wondrous Japan of to-day are: Bravery, loyalty, thoroughness, alertness and self control. The first two are qualities of the heart, the next two pertain to the mind and the last means the schooling of the will."

I shall never forget climbing up the steps of the battlefield of "203 Meter Hill" and North Fort at Port Arthur. Seldom in all history has such bravery been exhibited on the field of battle. The heroes who met their death storming the vertical front of 203 Meter Hill, and those who tied ropes to their feet so that their comrades could draw their dead bodies back after they went to certain death at the tunneling under North Fort, are typical today of the *bushido* of the ancient Samurai when that knighthood was in flower. Japanese bravery is such that suicide itself—which with us is the supreme act of cowardice—is glorified as the noblest act of self-abnegation. Suicide is not viewed as a cowardly escape from some personal dilemma, but as the most emphatic expression of personality. It is generally used as a last resort when all else has failed to move men to action against some great and impending evil.

The virtue of loyalty I have already referred to, as it manifests itself on the part of the people toward the Emperor and the Emperor to his ancestors. Loyalty, however, pervades all relations in life,

The wife is loyal to husband, children to parents, servants to masters, etc. Perhaps the most famous story in all Japanese history is that of "The Forty-seven Ronins," in which these forty-seven retainers deliberately murdered the noble who caused their lord's death, tho they knew they would all have to commit harikiri for the offense. I visited the tombs of these Ronins in Tokyo, as every traveler does, and to this day the tapers are kept burning by loving pilgrims in memory of the men who put loyalty above life itself. It was no idle traveler's whim that caused me to leave my visiting card at the grave of the leader of the Ronins, as I noticed the Japanese visitors were doing.

In alertness and thoroness the Japanese also excel. It is the universal testimony of foreign teachers that Japanese learn more quickly than other nationalities. In California I was told that the Japanese laborers are the quickest on the coast to adapt themselves to American conditions.

I was greatly imprest by the perfection of the "Tenyo Maru" and the "Shinyo Maru," the two giant steamships of the Toyo Kisen Kaisha (Oriental Steamship Company) that took us, one to Japan and the other home. These boats were made from stem to stern by the Japanese, and no Atlantic liner of their class could be better constructed or appointed. Moreover, the detailed forethought and attention that was given to make the voyage safe, agreeable and comfortable was far superior to anything I have ever experienced on the Atlantic.

But perhaps the thoroness of the Japanese is best exemplified in the Russian war, when their power of planning and combining details which had never before confronted the mind of man clearly indicated the tissue of their minds.

Their self-control is a trait that impresses every one. One of the most interesting talks I had during my trip was with a young grandmother of forty, who would not admit that we Americans excelled the Japanese because we were demonstrative with those we loved and communicated our happiness to others by freely expressing it. I frankly admitted that the Japanese were superior to us in their ability to keep their sorrow to themselves and not burden others there-

by, but she thought the Japanese way of repressing both pleasure and pain showed the nobler character. As Professor Reinsch says:

"The moral grandeur of suppressing the strongest passions and affections of the heart and obeying without a murmur the dictates of duty will always move the Japanese to the point of causing them to shed tears, even when the conflict is presented only in poetry or on the stage."

No Spartan woman ever made sterner sacrifices than the many Japanese wives, who during the Russo-Japanese war committed suicide so that their husbands at the front would not have to waver between home and country in the battle's crisis.

To bravery, loyalty, alertness, thoroness and self-control, the five Japanese virtues mentioned by President Scherer, I would add politeness, cleanliness, cheerfulness, contentedness and estheticism.

Japanese politeness is renowned the world over. Not even the French can surpass them in that respect. Such pretty, genuine and universal courtesy from all classes, high and low, I have never experienced. In cleanliness no people in the world approaches them. It is probably not very far from the truth to say that every Japanese man, woman and child takes a hot bath every day. Going over to Korea from Japan I went down into the hold of the steamer about midnight. There were 300 or more third-class passengers fast asleep, all packed in like figs in three tiers of beds. Tho the only ventilation came from a skylight above, the room was as fresh and odorless as the deck above. Those who have visited the steerage of any transatlantic liner, even the best, will appreciate this novel experience.

The cheerfulness and contentedness of the Japanese are as apparent to any visitor as their politeness and cleanliness. Every Japanese has a perpetual smile on his face. He has schooled himself to be contented.

I have already spoken somewhat of their estheticism in reference to art, architecture, painting, etc. I shall only refer here to two further incidents. I went to the chrysanthemum shows in both Tokyo and Nagoya. In both places the halls were literally packed with poor

people who had paid good money to see nothing but rows of potted chrysanthemums. On the railroad from Kyoto to Tokyo we suddenly came in sight of Fujiyama—the Peerless Mountain of Japan. There were some thirty Japanese in our compartment. Every passenger on the opposite side of the car moved across the aisle, and then the entire carload gazed in rapt adoration at the sacred mountain during the half hour we were skirting its base.

So much for the Japanese virtues. But have they no vices? Your anti-Japanese friend says, "conceit and deceit." The missionaries say immorality, tho from all I have heard on this subject I should say that the only difference between conditions in Japan and the United States is that we hypocritically bury our head in the sand and insist that we are virtuous, while Japan has actually abolished vice from every city except in the open, segregated quarters.

Dr. Julius Soper, for many years a distinguished missionary in northern Japan, thus tried to draw the balance between the good and the bad when he said in a sermon I heard him preach on shipboard coming home:

"If within the next fifty years the Japanese become as ethical as they are esthetic, as honest as they are polite, as virtuous as they are chivalrous, as philanthropic as they are patriotic, they will not be surpassed by any people of the world, of whatever clime, of whatever race."

Dr. Jordan, of Stanford University, who was in Japan while we were there, gave this interesting reply to the question "What has Japan to learn from the United States?"

"The value of individual initiative and individual adequacy, that equity is higher than courtesy, that the cure for vice is not found in prohibition but in the strengthening of the moral backbone of the individual man: that woman must be trained to wisdom if homes are to be the centers of culture and purity; that the final end of education is not official promotion nor personal culture, not the acquisition of knowledge for its own sake, but the development of personal effectiveness."

But after all the noblest trait in the character of the Japanese is their willingness to change for the better whenever they perceive their inferiority. This adaptiveness is not blind imitateness, as is so often charged, but rather selectiveness. Japan does not take the bad

with the good, but only the good which she grafts on to her own peculiar civilization, thus gaining a syncretism that is as admirable as it is unique. Whether Japan can preserve this noble trait of character as her intercourse becomes closer with other nations, time only can tell. Count Okuma, Japan's greatest living statesman, already sees a change. Says he:

"It is a question whether as a people we have not lost fiber as a result of the many new influences to which we have been subjected. Development has been intellectual not moral."

I have spoken at some length of the qualities of mind and heart in which it seems to me the Japanese people excel. I shall now take up in some detail the four departments in which they seem to be still deficient.

There is no doubt that business morality in Japan is generally lower than in the West. The testimony of foreigners doing business in Japan is almost unanimous on this point. The chief complaint is that the Japanese have two prices for everything, and that they have but a rudimentary sense of the obligation of a contract. I was told, for instance, that it was a common thing for a house-builder to refuse to carry out his contract if he found he had miscalculated on his estimate and was not going to make a profit.

There are mitigating considerations, however, that should be taken into account. Before the Restoration the business men constituted the most despised class in Japan, except the criminals. Under feudalism the classes were graded as follows: 1. The Emperor, above all; 2, the nobles; 3, the Samurai; 4, the farmers; 5, artists and artisans; 6, the merchants and traders; 7, the criminals and outcasts. When the community despises a man he naturally comes to despise himself. In olden times the merchant was expected to cheat a little and he naturally did not rise above the expectation. But with the advent of new Japan, with its elevation of the merchant class, there has been a radical change for the better, so that now, if the petty merchants still need some improvement, the great merchants and financiers maintain commercial standards as high as elsewhere. For instance, the manager of one large English

company, whose business extends over the entire world, says that his losses on Japanese sales are only 1 per cent., as against a general loss of 5 per cent. in other nations.

I am convinced, however, that some, if not much, of the feeling on the part of foreign merchants against Japanese business methods is a result of conditions not entirely discreditable to the Japanese. I was greatly astonished, especially in Yokohama and Kobe, to see evidences of the most narrow race prejudice against the Japanese by men who are making a living among them. I met one young clerk, for instance, employed by one of the largest foreign firms in Japan, who railed against the Japanese as only a Vardaman could against an educated negro. I do not see how a firm could have a less valuable employee, or how a young man could expect to make a business success by starting out in life berating those whose goodwill is essential to his ultimate success.

The foreign business men in Japan are also apt to deal with Japanese of a lower business grade than the firms they represent. Usually only the largest, richest and most substantial foreign houses attempt to do business abroad. Their representatives in Japan are likely to deal not with the Japanese firms of equal size and responsibility, but with hundreds of petty merchants and artisans with little or no capital. No wonder these small traders have not attained the same business morality that the foreign houses have which buy and sell with them.

Another reason that undoubtedly contributes to the disgruntlement of the foreign business man is the simple fact that the Japanese are taking the business away from him. I have obtained some very interesting figures on this point. Not many years ago the bulk of export and import trade centering in Kobe and Yokohama was in the hands of foreigners. In 1906 the Japanese had got 46 per cent. of it; in 1907, 47 per cent.; in 1908, 49 per cent.; in 1909, 51 per cent., and in 1910, 54 per cent.

Not only are the Japanese merchants getting the foreign trade into their own hands, but the Japanese manufacturers are doing likewise. The Japanese have not only the great advantage of cheap labor and a really marvelous ability to imi-

tate, but they have a government that aids them on every hand. The government of Japan deems it as much a part of its function to help business as agriculture or education. I can see no reason, therefore, why the Japanese should not soon become successful rivals of any manufacturing nation in the world.

The second deficiency in Japanese life today is in respect to the status of woman. Tho woman occupies an infinitely higher position in Japan than in India, China or Korea, she has not yet achieved the same rights and privileges that she is accorded in the United States and in some other European nations. It would probably be a fair comparison to state that men have as much more consideration than women in Japan as women have than men in the United States. Japanese women, however, are in no sense oppressed. On the contrary, they are kindly treated and apparently do not miss the legal and social rights of their Occidental sisters. Still, from every standpoint they hold positions inferior to those of the men.

A Japanese sage writes:

"The five worst maladies that afflict the female mind are indocility, discontent, slander, jealousy and silliness. These five maladies infect seven or eight out of every ten women and it is from these that arise the inferiority of women."

Another sage, writing on "The Whole Duty of Woman," remarks:

"The great lifelong duty of woman is obedience. . . . Should her husband be roused at any time to anger, she must obey him with fear and trembling, and never set herself up against him in anger or forwardness. A woman should look upon her husband as if he were Heaven itself and never weary of thinking how she may yield to her husband and thus escape celestial castigation."

The Japanese women are, accordingly, gentle, submissive and devoted. They are not kept in seclusion, but come and go as they will. Still, it is universally felt that their place is at home with the children. Social life is largely a masculine affair, and, while the man goes out to dinners and entertainments as often as he likes, the women are supposed to stay at home. Several of the Japanese ladies told my wife they were delighted that she accompanied me, because that meant that they could go with their husbands to dinner parties and receptions given in our honor.

Such a thing as a suffraget movement

in Japan would be absolutely unthinkable at the present time, not that anything would happen to a woman who suggested it, save possibly ostracism. Of course, the condition of a large class of unmarried women, which is so urgent an argument for suffrage in England, does not exist in Japan. I met only one unmarried woman over twenty-five all the time I was in the Orient. But that the position of woman in Japan is in need of some improvement is disclosed by the following facts:

A husband can divorce a wife at any time with her consent, or without her consent, for adultery, forgery, theft, robbery, embezzlement, receiving stolen property, desertion, cruelty, or if the wife mistreats his or her ascendants. A woman cannot marry under twenty-five without the consent of her parents. A wife must live with her husband and is as equally bound to support him as he is her. The husband has the right to manage all the wife's property, and in case of divorce has the custody of the children.

The life of the little girl in Japan must be ideal, for Japan, as every one knows, is the children's paradise. The old women have also a happy and contented time, judging from the respect and attention universally shown them. But from marriage till grandmotherhood the lot of the average Japanese woman is one of care, responsibility and self-abnegation.

The third deficiency in modern Japan is in regard to the organization of labor. According to Sydney Webb, who was investigating labor conditions while I was there, Japan is in the same condition today that England was 150 years ago. Industry is still mostly done in the home. Japan is not far removed from the economic stage in which an article is made by hand in the back room of a shop and sold by the artisan himself in the front. Of course, factories are springing up on all sides, and are already exerting a great influence on the economic life of the nation. But it will be seen how far Japan is behind some of the other nations in this respect when it is realized that there are no labor unions in the Western sense of the word in Japan today, and the first factory act ever enacted in the Empire dated from last year. This act is, of course, a step in advance in that it is the first national recognition that the em-

ployees require protection by the State against the unlimited exploitation of their employers. The act, however, will cause a sneer from the cynically disposed, for some of its most important provisions may be waived for fifteen years. It limits, however, the work of women and children, and that is a great step in advance. No child under nine can be employed in a factory and no new children under eleven accepted for employment, tho both these rules have exceptions. No children under fourteen, or women, except those in the regular night shifts, can work from 10 p. m. to 4 a. m. Apparently any male of fourteen or over can be worked as long and as hard as he is willing.

While long hours are not especially bad for farmers or artisans who are masters of their own business and time and can change occupation or rest when they get tired, they are invariably bad for workers in a factory, where no respite from the monotonous grind is permitted and where speeding up to the last ounce of power is the rule. In a factory the inevitable tendency is to make the worker a machine. Until the employers have achieved a much higher degree of altruism than they have in Japan or anywhere else, drastic laws are needed for the protection of the workers against undue exploitation.

I visited several factories in Japan, principally cotton, silk and dyeing establishments. The operatives were predominately women, most of them apparently girls of about sixteen to twenty years old. I saw many little girls at work that I could have sworn were under ten, tho I was told that appearances are apt to be deceptive. I saw no old women at work. Agents go out among the farmers and thru presents and saké obtain their consent to send their girls to the factories. The girls for the first two or three years are apprenticed and earn practically nothing besides their board; after that their wages rise to an average of 15 to 25 cents a day.

I copy herewith an entry from my notebook which I made after visiting one great factory:

"Muslin factory, one of the largest in Japan, employs 3,000 girls. Considered model. Hours 6 a. m. to 6 p. m., day shift, and 6 p. m. to 6 a. m., night shift. Highest wages

40 cents per day; average, 20; lowest, 10. Meals cost 6 cents per day. Company paying 2 cents and girl 4 cents. Girls look heavy and sodden. Two main types of work rooms, one where girls walked monotonously back and forth threading bobbins, other with frightful clatter of machines where girls stand up all day on cement floors. Floors said to get very cold in winter. Air bad and filled with dust. Girls have after work two study hours! Dormitories at back of factory. Each girl allowed 6x3 feet space in sleeping room I counted eight night-shift girls asleep on floor of one small room in afternoon. Heads resting on usual Japanese wooden blocks for pillow. Sunlight streaming thru the windows. Good baths and pretty garden for recreation, but no girl can leave compound without permission. Two holidays a month. Theater on grounds where entertainments can be given. Rooms provided for visiting parents."

In another factory I saw operatives eating their dinner while working at their benches, one hand using the chop-sticks, the other attending to the machine. In another I was told that the men do not leave the shop day or night, but sleep and eat on the matting strewn among the machinery and tools.

I was told by a professor in one of the leading universities that 20 per cent. of the girls become enfeebled and unable to work after one or two years in the factories and have to return home. One half of those who have to leave have contracted consumption. Another professor made the following assertion, and I quote his words directly as I took them down in my note book:

"Girls in factories are punished corporally, shut in dark closets, fined and have their rations cut down for various offenses, but conditions are better now than they were years ago, tho these practices still continue in some places. One punishment consists in stripping girls naked (save for a loin cloth), tying a red flag on their back and their hands behind them, and then marching them about among other employees (male and female) as an object of ridicule and ignominy. Of course the Japanese themselves recognize these conditions are bad and factory inspectors go about all the time to prevent such abuses, but there are not enough inspectors properly to cover the ground."

In the first annual report (1903) of the "Matsuyama Factory Girls' Home," of Kyoto, I find this sentence, which refers to the general conditions of the girls in Kyoto factories:

"The majority of them could neither read nor write, their popular songs were indecent, they were crowded together in disease breeding and immoral boarding houses, where they

were deliberately tempted to spend more than they earned. . . . The girls work in two shifts of twelve hours, from 6 to 6; they are required to clean up each day, so do not get out till 6.30 or 7. On days when the shifts change there is no work, but instead a special cleaning up is required and the girls who have worked all night are kept till about 10 a. m."

I speak of these facts simply to show that in changing from an agricultural to an industrial regime Japan is passing thru the same conditions that have disgraced the industrial movement in Europe and the United States. But Japan is waking up to these conditions, and doubtless it will not be very long before she will have as rigid and wholesome factory laws as exist elsewhere.

At the present moment, however, it is a fact that 73 per cent. of the total workers in factories are female, and that sometimes, when business is brisk, they work eighteen hours a day, the average seldom falling below twelve hours. The Department of Agriculture and Commerce made inquiry into factory conditions in twenty-five prefectures and compiled the following table:

Age.	Male.	Female.
Under 9	105	479
" 11	643	3,876
" 13	3,099	24,762
" 15	6,001	49,890
" 19	13,117	93,975
19 and over	58,933	116,542

The average wages of skilled laborers are about one-eighth of the wages in the United States to one-third of the wages in England. The first labor union in Japan was started in 1897, comprising some 2,000 men, mostly iron workers and mechanics in Tokyo and Yokohama, but it soon died. There was an outbreak of strikes in 1907 thruout the country, but the capitalists easily won.

The socialistic philosophy seems to be gaining ground in Japan. I heard this from too many trustworthy sources to doubt the fact. There is no socialistic party, however. In 1899 an attempt was made to start a socialistic association. It was academic in character and included both socialists and non-socialists. In 1901 the Social Democratic party was formed and a declaration was published, but it was dissolved by the authorities on the same day.

Ever since the recent attempt on the life of the Imperial family by some so-

cialist-anarchists the Government has been very strict in repressing socialism in any form. Nevertheless, the labor and socialistic movement in the Occidental sense has hardly begun in Japan. What will happen after universal education has been in existence for a generation and when capitalism comes into its flower, as it has already done elsewhere in the world, remains to be seen.

The only remaining deficiency in Japan's present civilization seems to me to be the lack of political power in the hands of the people. Considering, however, the short time that Japan has enjoyed a constitutional government along Western lines, she must not be blamed too much for this. At the present moment the number of those possessing rights of suffrage, out of a population of 50,000,000, is only 1,582,256 in national elections and 2,434,256 in prefectural elections. The qualification for a voter in national elections is that he must be not less than twenty-five years of age and pay a direct tax of not less than \$5 a year.

The general feeling seems to be that

the next great political reform will be a movement for the extension of the suffrage, yet I am told that the Government does not even give a permit to the Universal Suffrage League to hold a mass meeting once a year. Of course, until a far larger percentage of the adult population enjoy the franchise, there can be no such thing as popular government in the American or English sense of the word. It must be confessed, however, that Japan has got along very well so far without extreme popular government. Where in all history can be found an altruism on the part of the governing classes parallel to what happened in Japan immediately before and after the Restoration, when the Shogun, or *de facto* ruler of the empire, voluntarily abdicated his office in favor of the real ruler; when the feudal aristocracy petitioned the Crown to take over their estates and abolish their titles; when the Samurai, without bloodshed and even cheerfully, laid down their arms; and finally, when the young Emperor, thru no compulsion or fear of revolution, granted his subjects a parliament?

NEW YORK CITY.

Planning a Summer Garden

BY JESSIE P. FROTHINGHAM

A MIDSUMMER garden, like a midsummer's dream, cannot keep from being riotous—an Arabian night sort of affair. Perennials and annuals, lavish, intense, antagonistic, will fight and swear at each other unless separated and kept apart. It will require some generalship not to allow the riot to degenerate into civil war.

A writer on gardens says that it is safe to plant all kinds of annuals together, as Nature is harmonious. I cannot agree with this. It is true that Nature is harmonious, but she is also essentially natural. She does not make artificial soil; she does not bring plants from wood and stream, from field and marsh, from hill and hollow, from North and South, from Holland and Japan, and plant them together in a space 50 by 100

feet. Nature needs only instinct, but woman, when she steps in, must use her judgment.

A summer garden should be intimate and companionable; whether it is near or at a distance, it should have this quality of intimacy, of coming close to you. But it must not be seen at one glance of the eye; it must have hidden places, cool places, and draw you to them; it must have secrets, and lure you to discover them. A summer garden, with its warm, strong, pulsating colors, would tire the eye, if laid out in full view. Annuals are so vivacious, volatile and varied that they require a background or screen; in open, flat beds they appear staring and superficial.

It is not easy to find ready-made picturesqueness on a small country lot; we

must create it by a scheme of planting. Let the garden be on one side of the house and start from the vine-covered porch or terrace; the background of the house will be becoming to the flowers. The beds near the house should be filled with cool-tinted flowers, in lavender, pink and soft corn-color, such as primroses (yellow), snapdragons (yellow and pink), *Campanula mariesii* and *longistyla*, and perhaps the *persicifolia grandiflora* (violet and light blue), also *Campanula media* (single lavender), *Veronica amethystina* and *Incana* (amethyst blue), lavender itself, *Aconitum wilsoni*, a few *Lilium candidum*, larkspurs in shell-pink or salmon-rose, and different shades of pinks or dianthus, the Violet Queen, the lilac *Diadematis fl. pl.* Do not mix the yellow pinks and blue pinks, but decide which you will have, and select either the *Dianthus Salmon Queen* or *Eastern Queen* (rose). If you have yellow pinks you may plant against the house shrimp-pink *Lavatera* or annual mallow. Border the front edge of these beds with a thick row of violet or lavender pansies, and the charming

A PICTURESQUE PATH

FLOWERS IN MASSES

violas, the *Papilio* (butterfly violet), *Blue Perfection* and *lutea splendens* (yellow). Or you may have a border of the lovely *Carpathian harebell*, or *Campanula carpatica*, which is six inches high and is a hardy perennial, with clear, blue blooms during the entire season. You will also find among the foxgloves or *digitalis* good shades of lavender and pink for these color beds.

At one side of your garden, against a wall or fence (not a red brick wall), have a double row of hollyhocks in shades of salmon-rose, shrimp-pink, maroon and white, or you may prefer the bright rose tints to the shrimp shades, but do not mix them. The *Allegheny* is a beautiful variety of the double hollyhock, but I confess to a preference for the single varieties, with their superb colorings and good forms.

For a summer garden have turf paths; they rest the eye. And plant shrubs, especially those with ornamental and permanent foliage, like *Tartarian honeysuckle* and *Viburnum tomentosum*, forming vistas and turnings, something out of view, so that you will come suddenly upon a corner glowing with yellow bloom. Have in this corner all yellow and white flowers banked in green:

A FLOWER BORDERED PATH TO THE TEA-HOUSE

Golden-glow at the back, sunflowers, asphodels, white hollyhocks and dahlias, California poppies, yellow and white day lilies, yellow Japanese irises, monkshood or *Aconitum lycoctonum*, marigolds, *Anthemis tinctoria* and *Kelwayii*, *Lilium elegans* and *candidum*, while here and there a splendid spike of *Yucca filamentosa* gives a strong accent.

The *Tritoma* or poker-plant would mix well with orange flowers in the shrubbery; and there are two scarlet flowers that would be effective in large clumps among the trees and greenery, the cardinal flower, which needs a rich soil, and *Lychnis*, or London Pride.

Have somewhere, perhaps across the lower side of the garden, a straight, broad turf path, long enough to give perspective, at least a hundred feet long, with a goal of some kind at the end, a seat, arbor or rustic tea-house. Have hedges of shrubs on either side of the path, and wide borders of flowers built up against the green. Here you will have an opportunity for effective planting. But restraint must be used in the choice of kinds and colors. It is a case for selection; several dozen varieties must not be crowded into one border. And the main difficulty will be not to have an emphatic clashing of shades among the reds, to avoid placing close

together the scarlets, salmons and purplish reds in grotesque array.

Nothing is more striking than a thick row of cannas or gladioli at the back of the border, but there are few flowers that harmonize with gladioli; try white, orange and maroon flowers, certain shades of nasturtiums, and possibly some lilies, but that would be risky. Far distant from this group you will want a massed profusion of Shirley poppies, and as they self-sow they are permanent, and are some of the loveliest of the summer blooms. Many flowers combine in color with the Shirley poppy, such as stocks, pinks, columbines, cornflowers, Meehan's Mallow Marvels.

It would be easy to separate the opposing camps of reds by a section in blue and white: *Anchusa italica*, Dropmore variety, *Delphinium belladonna*, *formosum*, and *F. cælestinum*, monkshood (under shade), blue columbine, Canterbury bells, *Veronica longifolia*, *Platycodon mariesi* (blue), white phlox, verbenas, hibiscus, snapdragon, the dark blue and pure white Japanese iris, *Yucca filamentosa* and *Lilium candidum*.

A beautiful combination is *Delphinium* and *Lilium candidum*, or *Yucca* and Japanese iris. Have a group of each of these two combinations at the ends of a section, and between them the other blue

and white flowers massed together. Or bank them at the back against green; and have the lower flowers in front. And among the lower blue flowers you may scatter a few delicate pink dianthus; and along the front edge have a broad border of blue and pink forget-me-nots.

It is almost impossible to lay out a garden to every individual plant, and the most successful gardens are the result of experience. Every year some offending color has been transplanted to another part of the garden, borders have been altered, enlarged, simplified; some flowers have been uprooted, others added. Inharmonious colors, if not transplanted, may be separated or modified by clumps of white flowers.

We want particularly to remember, in laying out a summer garden, that it is easier to produce commonplace results with annuals than with perennials; that it will require more thought to be distinctive. There are two ways of showing our individuality: either by a well-thought out scheme of planting or by the selection of choice varieties of flowers.

It is a good rule not to let your flowers go to pods for the purpose of using your own seeds. Pick your flowers and buy seeds, not from a local florist, or from the department store, but from reliable seedmen and nurseries. Do not buy ordinary varieties of flowers. Do not, above everything else, buy packets of mixed seeds, unless they are special color mixtures, such as white and lavender shades, or pink, yellow and salmon shades. But it is better to make your own color combinations. So-called "mixtures" are cheaper and necessarily poorer.

Choice varieties of all flowers are

the named varieties, and the slight difference in expense, especially with seeds, is more than worth the great difference in quality. As an example, sweet peas, which are in almost every summer garden, may be unusual or they may be commonplace; the small, purplish-pink kinds are worse than indifferent, while the grandiflora carmine, buff, maroon, primrose and deep rose have beauty and character.

We do not want to keep in ruts. Of what advantage is it for horticulturists to produce thousands of new and beautiful varieties of flowers, if we do not advance in taste with them, and if we still fill our gardens with ordinary plants.

Let us leave behind the favorites of the carpet-bed period—the petunias, portulacas and pelargoniums, the balsams and begonias, coleus, cockscomb, candytuft and fuchsias, unless we grow the improved varieties in a picturesque tangle with a profusion of green. The geranium has a good claim to be kept in our window and veranda boxes; but why not select the new strains with large blooms? Why not try two or three new varieties each year, and thru selection and elimination attain individuality?

Cut flowers from your own garden are one of the pleasures of the suburban or vacation place. Remember to plant green herbs and grasses for their foliage, to mix with cut flowers, and also cultivate delicate, feathery blooms like baby's breath or gypsophila, which give a light effect to the other flowers.

Do not think that because you have a small plot you cannot have a garden. Nothing is prettier than to see a 25-foot yard a mass of bloom. Plant something, even on 10 feet of land, and have flowers, even in a soap box.

PRINCETON, N. J.

The New Housekeeping Movement

BY GEORGIE BOYNTON CHILD

[Mrs. Child is the business manager of the Housekeeping Experiment Station at Cedar Gate, Darien, Conn. She is now planning to build a "model home" to illustrate still further what can be done to ease the housekeeper's burdens.—EDITOR.]

TO most of us the value of preserving the individual home and the family group is not open to debate, but is an axiom of our civilization. Nevertheless it cannot be denied that the attitude of the home toward organized society is in these days somewhat apologetic. We hear more and more frequently, and with increasing emphasis, such questions as Why keep house? What does the home produce? Does home-making pay?

The first effective answer to these questions was suggested by Mr. Charles Barnard, of the Housekeeping Experiment Station at Darien, Conn. Mr. Barnard had spent his life as a technical writer on machinery. Therefore, when he turned his attention to the problem of home-making it was natural that he should look at it first of all as an engineering problem; that he should ask himself in all seriousness: What *does* the home produce? Is it equipped for its specialty, whatever that may be? And is the result an adequate return for the time, money and human energy invested?

First and foremost among the causes of the widespread discontent Mr. Barnard found to be the fact that the home, in the material and economic sense, *no longer produces anything*.

In times past—not so very long past, either—the home was an important if not a necessary agent in procuring the food, clothes and even the ready money required to meet the family needs. Land, lumber and labor were cheap. Many industries were carried on in the home. Every house sheltered not only the family, but also its quota of servants, farm hands and apprentices. The houses, even of people in very moderate circumstances, were of goodly proportions, with many rooms and generous outbuildings. The kitchen was the largest room in the house. Here several

people must work at a time dipping candles, preparing dried apples, trying out lard, quilting, knitting, sewing. In a village or city, where farming was not a main industry, the husband usually had his office or workshop in the house. Thus the home, in a sense, was a species of factory equipped for its special business; that special business being, as we said before, to produce a large proportion of what was required to meet the family's material needs.

Conditions have vastly changed since the days of our colonial ancestors. The home is no longer a producer. Almost all the industries which once were carried on within its walls have been taken elsewhere. Cooking, baking and sewing have all been minimized by the excellent ready-made products which the market now offers. Laundry work is going out to an increasing extent and will be taken completely out as soon as the business world organizes more of the right kind of laundries. The economic problem of the home is fast becoming a simple problem of shelter. It is evident, therefore, that the kind of structure so well adapted to the needs of our ancestors does not meet our needs under the vastly different conditions of today. The high cost of living, lumber and living expenses all forbid the generous proportions of our colonial homes. As the home is no longer a factor in production we cannot afford larger homes than we need, or homes equipped for uses they no longer serve.

This was Mr. Barnard's starting point. He saw clearly the need of reorganizing the home to meet present-day needs. He offered no ready-made panacea, but set himself patiently and thoroly to investigate the housekeeping problem and work out a scientific solution.

In the picturesque woods which are Darien's great attraction he found a house suited to his purpose. Here he

started what has since become the famous housekeeping experiment station. He announced that the station was maintained for the purpose of investigating the housekeeping problem, of collecting data and testing new methods, materials and appliances in cooking, and general housework, to the end that housekeeping may be made less laborious, less wasteful and more efficient. The result of his investigations was first given to the world thru bulletins which commanded the attention of progressive men and women everywhere.

When Frederick W. Taylor published his epoch-making book calling the attention of the business world to the enormous waste of human energy in industrial lines, Mr. Barnard saw that the next step in progressive housekeeping was to apply Mr. Taylor's principles of scientific management to the home. Even more wasted effort was apparent in the home than in the business world, and the results were even more disastrous. For the home, tho not a producer in the economic sense, was none the less producing the energy and ambition of

the individuals who worked in the industries. It was therefore of the greatest importance that the home fulfil its function to the best advantage and with the best results.

Looking about at the homes of the large majority of people Mr. Barnard saw that discontent, restlessness and despair were the fruits of the present home conditions, and that this is due to two main causes. Not only are homes wastefully equipped for uses they no longer perform, but they are totally unequipped for uses they must perform if individual home life is to remain intact and to exercise its rightful influence. In the organization of our family life no account is taken of the enormous changes that have come in the world outside the home. The whole of society has shifted from an individual basis to that of an organized and corporate body. Instead of dealing with the individual landlord, the individual merchant, the individual employee, the householder is subject to corporate holders of real estate, corporate producers, corporate light and power companies, amalgamated labor

THE LITTLE HOUSE AT DARIEN

This is the side entrance to the Housekeeping Experiment Station at Darien, Conn., where, under conditions possible to any home, a new and better housekeeping is being worked out

THE DINING ROOM AT DARIEN

The swinging door at the right opens into the kitchenet. The charm and simplicity of this little room show that efficiency and art may be simultaneously attained even in the most simple home

unions. At every point the home-maker is dependent on impersonal organized agencies which have, and can have, no consideration for his special needs and circumstances. The effect of all this has been to force the home itself into a new economic position. It must show its value as a conservator of human energy, an effective agent for resisting strain.

How can the home be equipped to fulfil this new function? How can it give the best results in individual and family life, and at the same time fight the trusts, pay exorbitant rents, and meet the constantly soaring food bills and the still more exacting demands of labor.

The answer is found in the new gospel of efficiency, the scientific management which has worked such miracles in the business world, the new study of economy and conservation of human energy which, in housekeeping, means more than anything else conservation of the housekeeper's energy. For upon her depends the success of the family as an institution. If she can be taught to do her part without strain the tension of

the whole family life will be relieved. Applying Mr. Taylor's principles, the first care of the experiment station is to save the wasted time and strength due to faulty arrangement of the house; or rather to its arrangement for conditions that no longer exist. *Simplify and co-ordinate*, said Mr. Barnard, beginning with the kitchen, dining-room and pantries. These are the working parts of the house, and on their right arrangement depends the conservation of the housekeeper's energy. There should be no long routes to travel between stove, sink and work tables; no old-fashioned grouping of all groceries in one place, all agate ware in another, all food materials in still another. The kitchen processes must be co-ordinated. The bread box, the bread in it, the bread board and knife should all be kept together. So should the materials and utensils used for baking. Tea, coffee, cocoa; teapots, coffeepots and cocoa pot should all be near the stove where they are used, and convenient to both ice box and dining room.

Next the method of work is studied. Rule-of-thumb methods are discarded and a standard best way is worked out for each household process. This working out of the quickest and most effective method involves the study of

reached or handled. Straining upward, or the bending over of the entire body in performing household tasks involves an absolutely unnecessary and wasteful expenditure of energy.

Haphazard planning is of course dis-

A HOME-MADE CABINET

On the right of this cabinet stands the refrigerator, with revolving shelves, next to it the fireless cook-stove, opposite the alcohol stove, oven, etc. The sink stands at the left of the cabinet and is only a step from the stove

motion-saving. The housekeeper must learn to perform each task with the smallest possible number of motions and without any that are awkward or unnecessary. This also involves a study in arrangement. It means that things must be placed where they can be easily

carded. A well worked out schedule and system is one of the first essentials in getting the best results. Every member of the family must be taught to recognize the rights of every other member. Husbands, wives and children must respect the collective life, must all do

their part to fit into a harmonious plan which will give each member of the household the maximum liberty consistent with the general welfare. As the ability of the housekeeper to plan and to execute plans depends very largely on her training for her work, personal efficiency must be part of the new housekeeping. The modern housekeeper must learn her work if she does not already know it. The fact of being in her own home no longer serves to hide or to excuse inefficiency, since the results of it are now so disastrous and far reaching.

Finally, due consideration must be given to the utensils and tools for housekeeping. As labor is the most expensive and uncertain item in the cost of maintaining a home, the housekeeper must, as far as possible, substitute for it the best appliances to lighten housework and save labor bills. By arranging the house properly and equipping it with the right tools many women are getting along without servants now, who formerly found them absolutely necessary. In many cases a saving of three or four hundred dollars a year is the result, besides a wonderful gain in the comfort and peace of the home.

An intelligent study of home making also suggests changes in heating and cooking arrangements which bring about increased comfort as well as a great saving in fuel. A wonderfully simple and inexpensive heating system was installed at the housekeeping experiment station which gave better results than many of the high priced furnaces. The aggregate household waste from coal ranges and furnaces each year would

suffice to run without friction many thousands of homes.

And now we come to a question which is doubtless stirring at the back of the mind of every woman who reads this article. Does scientific housekeeping mean that the housekeeper, the mother of the family, must work harder than ever before? No, indeed. That is the most wonderful part of it all. It means that she will get so much better results from her work that she will soon be able to create for herself conditions that will realize, even for her, the laborer's ideal of an eight-hour day: Eight hours for work, eight hours for sleep, eight hours for recreation. What more can any reasonable human being desire?

This is a day of transition for the housekeeper. She may not be able to build her ideal house. She may not be able to reconstruct her family and thus secure the co-operation that makes the perfect home. She may not be able to reconstruct herself so that her work is done to the best advantage. But a new day is dawning. The goal of better conditions is in sight. The home-maker sees ahead of her more liberty, more rest, more intelligent service to her loved ones. At last the door of the home has opened to the intelligence and skill that have made the achievements of the twentieth century so wonderful in other lines of endeavor. Into the home has come that great freedom of thought that lifts men and women above the limitations of distance, time and space. That means the coming of peace and happiness to numberless anxious and overburdened souls. It means hope. It means emancipation for all womankind.

DARIEN, CONN.

On an Old Theme

BY SHAEMAS O'SHEEL

THE white rose seems too proud,
But its heart is gold;
So is the heart of my love,
When all is told

And the red rose is passionate flame
'Round a heart of gold;
So, ah so is my love
When all is told!

Employers' Liability and Workmen's Compensation

BY GEORGE SUTHERLAND

UNITED STATES SENATOR FROM UTAH.

ON June 25, 1910, a Joint Resolution of Congress was approved by the President authorizing the appointment of a commission to make a thoro investigation and report to Congress thru the President upon the subject of employers' liability and workmen's compensation, and to make recommendations respecting legislation.

This commission held numerous hearings at Washington and elsewhere on the subject, and a few weeks ago transmitted these hearings, together with a report, and a proposed law providing for the payment of compensation by railroads engaged in interstate commerce to their employees sustaining injury in the course of their employment, and to their dependents in case of death resulting from such injury. This commission consisted of two members of the Senate, two members of the House of Representatives, the President of the New York Central Railroad system, and the editor of *The Railroad Trainman*, so that all interests were fully represented, and as the report was unanimous the law proposed may be regarded as fair all round.

The common law system of liability by which the employer was held liable for damages to an employee sustaining personal injury only when the same resulted from the negligence of the employer, with its defenses of assumption of risk, fellow-servant negligence and contributory negligence, no longer meets the just requirements of the modern relation of employer and employee.

Nearly every civilized country in the world has abandoned the law of liability and has written in the place of it a law providing for definite and certain compensation to all injured employees irrespective of negligence. Germany has had such a law for the past twenty-five years, England has provided for accident compensation to injured workmen since 1896, and other countries of Europe and the English Colonies have had

in operation similar laws for many years. No country which has ever adopted the compensation plan in place of liability for negligence has ever abandoned it. Careful observers in all these countries, as well as students of the subject in our own country, concur with singular unanimity in the view that not only is the compensation law just and equitable to the employees, but that it has resulted in substantial benefit in the way of preventing waste, reducing accidents, and relieving society from the burden of supporting indigent workmen who, because of injury, are unable to care for themselves, and because of their inability to prove negligence on the part of the employer, unable to recover damages.

The rules of the common law originated at a time when the relation of master and servant was exceedingly simple. The number of servants employed by the same master were few. They were brought into daily and intimate contact with one another; they understood one another's characteristics, habits of care or the reverse, sometimes far better than the master himself. There was reason, therefore, for holding the master not liable for an injury to a servant due to the negligence of a fellow servant. The tools and appliances with which the servant performed his work were of simple construction, generally manual tools. All the conditions respecting the place where and the tools with which he worked were open and obvious. There was reason, therefore, for saying that the servant who voluntarily entered or voluntarily continued in the service under such circumstances assumed the natural risks of the employment. Moreover, the master was brought into daily and close contact with his servants and exercised a supervisory care over them. Generally speaking, the relation which subsisted between the master and his servants was domestic in character. These conditions have changed in every

respect. Moving, and sometimes rapidly moving machines, often highly dangerous and complicated in structure, have taken the place of manual tools. The simple forms of power have been supplanted by the dangerous and powerful forces of steam and electricity. The servant no longer pursues his work in his own way surrounded by simple conditions, but he has become a human cog in a piece of highly complex mechanism, kept in motion by forces under the control of fellow servants in a separate department at a distance with whom he may never have been brought face to face. His master is removed from contact by the interposition of supervising agents, and is still further removed by the creation of the modern corporation. In these circumstances the doctrine of assumption of risk has, in the vast majority of cases, little if any application.

The rule which absolves the master from liability if the injury is occasioned by the fault of a fellow servant, under these modern conditions, has in a vast number of cases become thoroly unjust. The number of employees in the service of one employer has been vastly increased. The New York Central Railroad System, for example, employs more than 100,000 men. Under the simple conditions which prevailed at the time the common law rules originated accidents did not happen if the master and his servants pursued their work in a normal and ordinarily careful way. Accidents were usually the result of somebody's negligence; hence negligence being the controlling circumstance in cases of personal injury, was naturally made the basis for recovery or defense. Today, however, perhaps more than one-half of all accidents to workmen result in a greater or less degree from the inherent dangers of the employment, and should, therefore, be regarded as risks of the industry itself, to be borne by the industry, just as it bears the expense of the wear and tear and accidental destruction of the machinery.

Even the doctrine of contributory negligence has become inapplicable in a large number of cases to which under other conditions it formerly applied without injustice. The railway employee, for example, in the operating service is compelled to do his work often

under extreme pressure. Traffic accumulates in the switching yards and must be speedily moved or congestion results. Trains must be run on time or schedules are disarranged and collisions follow. The trainmen have no time for deliberation; they must act promptly. The value of their service often depends quite as much upon the celerity with which they perform their duties as upon their skill and efficiency. They are surrounded by constantly changing but ever present dangers. The exact effect of an action cannot always be anticipated. Under these circumstances the employee often meets with an accident which upon cool reflection appears to have been the result of carelessness, but which in reality was due to the hasty choice of the more dangerous method of doing the work forced by the necessity for immediate action.

The changed conditions thus briefly alluded to have been recognized in this country to a greater or less extent, and the resulting injustice sought to be avoided by modifying the various rules of the common law. The doctrine of assumption of risk, for example, has been modified so as not to apply where the master has failed to furnish safety devices required by statute. The fellow-servant rule has been altered so as not to apply where the servant injured is subject to the direction of a superior servant or where they are engaged in separate departments of service, and the doctrine of comparative negligence has been substituted for the common law rule of contributory negligence. In some States the common law is still maintained in practically its original form, in others slight changes have been made, and in still others changes have been of a radical character. There is an entire lack of harmony in the legislation of the various States, but the legislation all indicates a growing dissatisfaction with the common law system of liability. In the opinion of the commission, it is not so much the details of the system which are at fault as it is the basic principles underlying the whole theory of liability for fault. There should be a frank recognition that the common law liability of the master for negligence, with its controlling defenses, has been outgrown, and that we should put in the place of it a compensation law

which recognizes as the ground of recovery only the *fact* of injury resulting to the workman in the course of his employment.

This is the purpose and the underlying principle of the bill now before Congress. It provides that every common carrier engaged in interstate or foreign commerce by railroad shall pay compensation in amounts as specified in the bill to any of its employees who, while employed in such commerce, sustains personal injury by accident arising out of and in the course of such employment; abolishing all common law and existing statutory remedies. It would be impossible and undesirable here to go into the details of the proposed law, but they have been long and carefully considered, and the manner of payments, the amounts to be paid for various degrees of injury, and the methods of adjustment are all specified, after a thorough investigation, comparison and computation, with a view to saving the injured employee the cost of litigation.

The present system is wasteful. It enables some employees who can show to a jury that the employer was negligent to recover damages, sometimes inadequate, sometimes fair, sometimes extortionate, while the majority of employees who are injured, not being able to prove negligence, must bear the sole burden of the loss. While large judgments are sometimes obtained, a great proportion of the money paid in satisfaction goes into the pockets of counsel and is dissipated in other ways before it reaches the pockets of the employees. Litigation is often prolonged for years, and the injured man and his family in the meantime are compelled to live upon the charity of the public or upon the contributions of the workmen's associations.

Nearly every civilized country in the world except the United States has adopted the compensation plan and it has been in successful operation for twenty-five years and upward. Such laws, in the opinion of all intelligent observers, have operated to bring about better relations between employer and employee, eliminate waste, reduce accidents and promote justice. No country which has adopted the system has ever returned to the old law of liability for negligence, which in itself is striking if

not conclusive proof of the wisdom of the change.

One of the greatest benefits obtained by this change in the United States will be the reduction of accidents. By providing that the carrier shall be absolutely liable for every accident to its employees resulting in disability or death, we appeal to the strongest incentive, self-interest, to devise and adopt every possible precaution.

The tendency of the existing law is to cover up and conceal the real cause of an accident. The employee when injured bends every effort in the direction of establishing his employer's negligence; the facts are too often distorted and misrepresented in order to establish this element. On the other hand, it is to the interest of the employer to distort and misrepresent the facts so as to disprove or minimize his own negligence or prove or exaggerate the negligence of the employee. In this double distortion the real truth does not appear. A compensation law will strongly tend to remedy this condition, because when the employer knows that for every accident he must pay a definite amount, and the employee knows that he must receive a definite amount as full compensation irrespective of the cause of the accident, the temptation to misrepresent, distort or conceal the facts will have been eliminated. Having ascertained the truth respecting the manner in which accidents occur, we shall be able to devise and apply remedies for their prevention with greater certainty and effectiveness.

The only exception which the bill makes to the railroad's responsibility to pay is where it is proved that the accident was occasioned by the wilful intention of the employee to bring about his own injury or the injury of another, or where it is the result of intoxication while on duty.

While the bill is confined to the railroads, a vast number of employees will come under its operation. According to statistics carefully gathered by the commission, there are employed in the railroad service of the country in round numbers 1,700,000 men, with an aggregate pay roll of nearly \$1,200,000,000, embracing 250,000 miles of railroad, and involving an investment of between 18 and 20 billions of dollars. These rail-

roads are paying out under existing laws slightly more than \$10,000,000 per annum for personal injuries and deaths among their employees, but perhaps not more than half of this amount ever reaches the employees, the other half being paid out for counsel fees and other wise, as already shown. Under the proposed bill the railroads will pay out approximately \$15,000,000, and under the safeguarding provisions of the bill substantially all of it will reach the employees. These payments are to be made periodically, and inasmuch as the deferred payments will remain in the hands of the railroads for use for varying periods of time, the aggregate net expense to the companies will be somewhat reduced from these figures, but as nearly as can be estimated, the bill will add to their expenses about 25 per cent. In other words, for every dollar which the railroads now pay, they will under the proposed law pay to their employees \$1.25, while for every dollar which the employees now receive they will under the proposed law receive nearly \$3. While some employees who could be able to prove negligence will receive less than they might receive at the hands of a jury in the form of damages, the employees taken as a whole will without the slightest doubt receive vastly more than they could possibly expect under existing law or any reasonable modifications of existing law which could be constitutionally framed.

As already stated, the effect of such a law will be to reduce the number of accidents. In round figures, approximately 4,000 men are killed every year in the railroad service and 75,000 to 80,000 sustain injuries of a more or less serious character. Aside from the loss of wages which this entails upon the employees or their families, the economic loss to the country is enormous, involving as it does the loss of over 50,000,000 days' work per annum. If no other reason existed for the passage of this law save the reduction of this appalling destruction of life and limb and this tremendous economic loss, the law would be amply justified.

The law provides that payments shall be made periodically—in case of total disability lasting for the life of the in-

jured—instead of in lump sums, which will prove of great advantage, avoiding the loss thru bad investment which at present so often follows the reception of a lump sum by those not experienced in financial affairs. And incidentally, the benefit to society of this system of payments must not be overlooked. Even among those who are able to recover under existing laws the money is often badly invested or expended, and the injured employee and his dependents are forced to depend upon public charity. The system of periodical payments as arranged in the proposed law will insure the support of the injured and his family thru the industry which occasioned the injury.

The bill provides, in the absence of voluntary settlement, for adjusters of compensation who are to be under Government pay in order that they may be in no way dependent upon either the railroad or the employees, thus insuring impartiality. This expense to the Government will not be great, comparatively speaking, and when we remember that a very large proportion of the time of all the district judges is at present taken up with personal injury litigation of this character, and that under the proposed law the dockets of the courts will be almost entirely cleared of these cases, it is evident that the reduction in court expenses will go far toward meeting, if not entirely covering, the aggregate expenses of the adjusters.

I believe the proposed law to be a wise and sane solution of the problem. If it shall be enacted its influence should and doubtless will extend beyond its own limits as a progressive step which will to some extent guide new legislation along these lines in the various States of the Union. We have lagged far behind the other countries of the world in beginning this reform. The last four or five years, however, have witnessed the appointment of many State commissions who have thoroly investigated the subject, and the passage of compensation laws in several of the States, and it is only a question of a short time until this just, humane and advanced method of compensating injured workmen will be universal thruout the country.

WASHINGTON, D. C.

The Heart of Brittany

THE keynote of M. le Braz's Brittany is found in the proverb which he quotes as epigraph for one of his provincial tales: "Between the old man and the child there is only life; and life is so little." There is no subject which so captivates the Breton imagination, writes the author of *The Night of Fires*,* no subject with which he is so much at home, as that of death. "For him, to die is simply to emigrate."

And so it is that M. le Braz, successor of that line of nineteenth century poets, conteurs and savants who have made Brittany known as a treasury of folk lore, fidelity and mysticism, has written the "Legend of Death," and, in the various yellow-backed volumes which have been published at Paris, many short stories and sketches of the ways in which *l'Ankou*—Death—comes to gather in his harvest. He tells us also of the customs which Bretons use in celebrating funeral rites and the feasts of saints, who, as often as not, are recorded only in provincial hagiography: rites that have changed comparatively slowly in the back-country, since the proverb which we read in Brizeux's "Wisdom of Brittany," *The old customs are the good customs*, is one which has been lived as well as repeated. No noun occurs more frequently in the book, *The Night of Fires* than *Death*: yet the pervading spirit of the work is not gloomy. We would not deny to M. le Braz's Brittany the distinction of melancholy; but what is more pleasing than such a grave melancholy as is at once restrained, and, at proper intervals, relieved by its interpreter's natural geniality?

M. le Braz is fortunate in having for translator a friend who not only knows and loves Brittany, but is on her own account a writer of more than commonly suggestive travel books. Mrs. Gostling has admirably performed her present

task in rendering into English which parallels in simplicity and emotion the French of her original. The accounts of the fires lighted in honor of St. Peter, and of "The Night of the Dead," the narratives entitled "The Child of the Yeun," "A Summer Funeral" and "Easter in Iceland," are drawn from different volumes, but are one and all moving and sincere examples of the work executed by a truly cosmopolitan provincial: a writer who, born "in the tiny village of Saint Servais," sought learning, as he tells us, that he might

"show the world the unknown beauties that are in my race. I began with the folklore—that is to say, with the study of all which is deepest in the Breton soul. I passed years talking with the old folk, watching them live, work, dream. All that I have done, therefore, is to give an artistic form to what I have seen and felt, seeking to lay less stress on my own dreams, than on the dreams of my people."

And M. le Braz has made known the beauties of his people, not to France alone, but to a number of English and American readers that is constantly increasing. Celticism is today a popular study, and life and literature are alike the richer for it.

In M. le Braz's "The Land of Pardons" Mrs. Gostling translated a book that has already become popular as an informal guide to certain parts of Brittany. The new volume of tales and studies has for its scenes a more sequestered portion of the *Bretagne bretonnante*. The soul of an ancient province finds here partial expression. No one but M. le Braz could have written the book, partly because few writers, even among natives of the province, would be so welcome at the hearthstones and bonfires of the naïve population. Nor could any one but Mrs. Gostling have translated it with such admirable naturalness and understanding. No doubt the vividness of the printed page is intensified for readers not familiar with its scene by the photographs from which the many illustrations are reproduced.

*THE NIGHT OF FIRES AND OTHER BRETON STUDIES. By Anatole le Braz. Put into English by Frances M. Gostling. London: Chapman & Hall, Ltd. New York: Longmans, Green & Co. \$1.30.

The Stars and Their Path-Finders

HINKS'S *Astronomy*¹ contains about the same amount of reading matter that will be found on seven or eight pages of an ordinary newspaper. In this compass it gives, in the best sense of the term, popular accounts of astronomers and observatories, the sun, moon, planets, comets, meteors, stars, nebulae, Milky Way, celestial measurements, and the laws of gravity. Within the space at command these topics cannot be treated exhaustively, but the author, who for many years has been dealing with astronomical facts at first hand, has with rare judgment selected salient matters for presentation and joined them together into a consistent whole, so that when one has finished reading the book he feels that he has been instructed at every page and that he has obtained some indications of the present state and tendencies of astronomy. There is little in the book that calls for adverse criticism. To one who has seen that moon creep over the face of the sun at the time of a total eclipse and watched the corona grow in brightness during the last half minute before the disappearance of the last portion of the sun's disk, the statements—"So long as the slightest segment of the sun remains, no corona is to be seen; so long as even a single bead of light on the moon's limb marks where the sun is shining thru the notch of a lunar valley, the corona remains invisible"—will be attributed to the author's misfortune, as he tells us in the book, in having clouds prevent his seeing the only total solar eclipse which he has gone to observe, and to his having placed too much reliance in the descriptions of those who have written more for effect than in accordance with fact. Hinks's *Astronomy* is a present-day statement of facts and tendencies, compressed into small space, without embellishment.

On the other hand, Olcott's *Star Lore of All Ages*² deals with the em-

broideries of the subject: those poetic fancies which have attached themselves to the constellations, and which thru many centuries have been the common literary property of all civilized and semi-civilized peoples. The book treats generally of the mythology of the constellations; of the beliefs and traditions concerning the stars and star groups, and only incidentally of recently acquired scientific facts. It is a well-made book, beautifully printed, with diagrams of the leading star groups and constellation figures, and with numerous full-page halftones of noted works of art, temples, etc., which in one way or another are associated with the traditions and beliefs concerning the stars. The author has brought together much interesting information and presented it in a very readable manner. He has given enough to satisfy the demands of the general reader, without entering into such technicalities as would render the book burdensome.

A third textbook of astronomy, no less curious in its title than "The Geography of the Heavens," that was popular sixty years ago, is Albert Ross Parsons's *Road Map of the Stars*.³ It is an admirable chart to find the stars at any hour of any night, there being forty-eight brilliant small charts of stars on a blue-black background, each chart of the size of a small sheet of note paper, and all pasted on a large linen sheet to be folded up. The same charts are also in a small book, with definitions and instructions for use. Nothing could be made more convenient for one wishing to learn the constellations and stars.

As for *The Great Star Map*,⁴ by the Professor of Astronomy in the University of Oxford, it is a work intended for intelligent readers, but is sufficiently popular. The great map of the stars herein described is made by photography, and, as completed, on paper, weighs two tons. Work has been going on it for twenty-five years. This must not be confounded with the Harvard map, a smaller one, and for other

¹ASTRONOMY. By Arthur R. Hinks, Chief Assistant, Cambridge (England) Observatory. 12mo, pp. 256. A volume of the Home University Library of Modern Knowledge. New York: Henry Holt & Co. 50 cents.

²STAR LORE OF ALL AGES. A Collection of Myths, Legends and Facts Concerning the Constellations of the Northern Hemisphere. Illustrated. 8vo, pp. 453. By William Tyler Olcott. New York: G. P. Putnam's Sons. \$3.50.

³THE ROAD MAP OF THE STARS. By Albert Ross Parsons. New York: Mitchell Kennerley. \$3.

⁴THE GREAT STAR MAP. Being a brief general account of the international project known as the Astrographic Chart. By H. H. Turner. 16mo, pp. vi, 169. New York: E. P. Dutton & Co. \$1.

purposes than measurement more convenient. Professor Turner gives the history of this great map of the sky, tells of the difficulties encountered, the discoveries made, with diversions as to new stars and the asteroid Eros related to the work of the photographing of the heavens. A reader will find much of the new discoveries, such as the number, distance and drift of the stars.

Finally, *A Beginner's Star-Book*⁵ is, like two of the volumes mentioned above, nothing other than a guide to the heavens. It is purely observational. It tells with fulness and clearness what one can see with opera-glass, field-glass, or small telescope. It is not a treatise on astronomy, and the reader is not puzzled with mathematics or the mystery of solstices or nodes; nor will he be told anything else known or guessed which he cannot see. He is given a guide what to look at and admire thru his glass, as Tennyson said to Lockyer, "Let us look at a double star," and he took the astronomer to his two-inch telescope. This is the best way for a beginner, or for the ordinarily intelligent inquirer, just as it is better first to know plants before studying their ecology. Accordingly, nothing will be learned of the drift of stars, or of the canals of Mars, or of the cause of the mountains on the moon, nor a world of new stars. But excellent plans and diagrams of the stars are shown, and then the reader is told just what to see for himself; and beyond this there are only admirable copies of the finest nebulae from the Yerkes Observatory.

The Life of Dr. D. K. Pearsons, Friend of the Small College and of Missions. By Edward F. Williams. Boston: The Pilgrim Press. \$1.25.

Dr. D. K. Pearsons has had a unique if not remarkable career. The first seventy years of his life he spent in gaining his educational equipment and amassing a great fortune. Then, suddenly, at the height of his business success, but with years enough behind him to warrant

complete retirement, he exchanged the familiar work of acquisition for the laborious task of spending five million dollars in ways that would be most advantageous to his country and humanity. Influenced by experience, careful investigation and a shrewd forecast of the trend of development, Dr. Pearsons chose the small denominational schools and colleges as the main objects of his benefactions, and for more than twenty years he worked with all his old ardor and skill to locate in the most productive places and under the most favorable conditions his many gifts. Scores of struggling institutions all over the United States, and some in foreign lands, have been awakened to vigorous life and started on new careers of enlarged usefulness by the wise giving and personal encouragement of Dr. Pearsons. Mr. Williams's story of the Doctor's life, and particularly of his philanthropic labors, is well told, and furnishes a great object lesson of wisdom in the expenditure of wealth. The closing chapters show beyond doubt that Dr. Pearsons discovered a modern method by which a camel may pass thru a needle's eye.

The Constitution and Law of the Church in the First Two Centuries. By Adolph Harnack, Professor of Church History in the University of Berlin. Translated by F. L. Pogson, M. A., Edited by H. D. A. Major, M. A. New York: G. P. Putnam's Sons. \$1.75.

The question of the organization of the early Church has more than a historical interest because various branches of the Christian Church today appeal to that period as a final authority and not merely for instruction in following its successes and avoiding its mistakes. In fact, the desire to justify the present by the example and teaching of that distant past drives many interpreters to what Harnack calls the "ecclesiastical" as distinct from the "historical" standpoint, and creates an opposition more acute than in any other department of Church history. The two men who have done more than any others to make clear the historical forces which led to the formation of the Catholic constitution of the Church which obtained at the close of the second century are Professor Harnack, of Berlin, and Rudolph Sohm, professor

⁵A BEGINNER'S STAR-BOOK. An easy guide to the stars and the astronomical uses of the opera-glass, the field-glass and the telescope. By Kelvin McKready. With Charts of the Moon, Tables of the Planets, and Star Maps on a New Plan, Including Seventy Illustrations. Large 8vo, pp. vi, 148. New York: G. P. Putnam's Sons. \$2.50.

of law in the University of Leipsic, whose great work, "Kirchenrecht," appearing in 1892, placed him in the first rank of investigators in this field. Several years later Professor Harnack reviewed the whole matter in a succinct form in an article in the Protestant Real-Encyclopedia. In 1909 Professor Sohm returned to the subject in his "Wesen und Ursprung des Katholizismus," in which he took Harnack sharply to task and went so far as to deny that there were any local organizations at all in early Christianity. In the present volume we have a translation (well performed) of Professor Harnack's Encyclopedia article somewhat enlarged, Sohm's view as given by Harnack with the latter's criticism of it, and some of Professor Harnack's related essays. Both writers agree that the earliest conception of the Church was that of a heavenly or ideal society without any earthly form, authorized or otherwise, but they disagree in their views of the manner in which this ideal became incorporated in a visible institution. Professor Harnack holds that the local forms and necessary organizations present in germ from the very beginning slowly increased in power until they limited and finally controlled the spiritual elements, while Professor Sohm contends that ecclesiastical law and organization were born of the natural attempt on the part of the spiritual elements to dominate and control the whole life. The volume is compact, closely reasoned, vigorous and scholarly to a remarkable degree. It is a great advantage to have these divergent views presented together and in a comparative way. The book forms a valuable compend of the sources and present state of knowledge of the entire subject.

The American People, A Study in National Psychology. By A Maurice Low. Boston: Houghton Mifflin Co. Vol. II. \$2.25.

It would be difficult for any one to write two good-sized volumes on the "American People," such as those of which the second is before us, without frequently telling the exact truth. It would be extraordinarily hard for Mr. Low to do it, for he is a trained and ex-

perienced journalist, with a wide knowledge of the United States of today. It must, therefore, be admitted that his book is often a useful guide for the reader who wants to know his country better. It is well written in an easy journalistic style, and some of the epigrams (that his publishers have so kindly printed on a separate sheet for our use) are not only pointed but helpful. Yet the work is neither history nor philosophy. Mr. Low has not escaped the dangers that beset the historical philosopher. The more facts the historian knows, the greater is his reluctance to frame resounding generalizations, for nothing is more elusive than a cause, unless it be a motive. The knowledge of Mr. Low is derived from standard secondary works, which he often quotes. In these he has read enough to know the *obiter dicta* of their writers, and be misled by them. He has sometimes followed up their footnotes and read passages in the original documents, which he spreads elaborately in his own notes. But he shows no sign of either first-hand knowledge of the facts or intimate acquaintance with the work of the leading historical scholars who are today re-writing American history. His greatest familiarity is with works like his own, in which temper and temperament are of higher consequence than sources, and in which is always to be found a truer portrait of the writer than of the subject. It adds to the value of his work that Mr. Low is fair and tolerant. We can commend heartily his chapter on immigration. But what are we to do with him when he elevates the Spanish War into a primal cause? When he describes the Federal Constitution as "a monumental episode" (273), and says that it was "born with full stature" (274), we fear that his historical reading has been more flimsy than his sixteen-page bibliography would suggest. We have searched his pages in vain for a recognition of the social bearings of the open *hinterland* that so increased the importance of material things and colored the imagination of the United States during its first century. Yet we have enjoyed his book, even if it is not, either in acumen or in learning, a second Bryce.

Woodrow Wilson: The Story of His Life.

By William Bayard Hale. Garden City, New York: Doubleday, Page & Co. \$1 (cloth); 50 cents (paper).

William Bayard Hale's story of the life of *Woodrow Wilson*, contributed to a monthly magazine, has now made its appearance in book form. The biography is an intelligent performance and the biographer proves on more than one page not only appreciation of the educator and leader, but also his own independence of judgment. The narrative opens with an account of Governor Wilson's Scotch-Irish ancestry, his boyhood in Georgia, and his education at Davidson College and at Princeton. The biographer makes nothing clearer than what Mr. Bridges terms Wilson's "confident selection" of his work as an undergraduate, his "easy indifference" to all subjects not pertinent to his purposes.

"His business in college apparently was to train his mind to do what he wanted it to do. . . . His mind had now settled definitely upon the public career. His purpose in Princeton was a clear and single one of preparing himself for public life. . . . He began to practise the elective system ten years before Princeton did."

Subsequently the electionist studied law at the University of Virginia, hung out a shingle at Atlanta, returned to academic study at Johns Hopkins, and taught the science of government in Bryn Mawr College, Wesleyan College and Princeton. At the latter institution he was, as we all know, called to succeed Dr. McCosh as Princeton's first lay president. The battle which Dr. Wilson fought for his ideals of student democracy and of a more than nominal education is one which has re-echoed thruout the country, and all that we care to say of it here is that Dr. Hale's narrative seems to us reasonably fair while not failing to emphasize the clear-sightedness and far-sightedness of the college president. Dr. Hale is a journalist, and he has brought the story up to date, giving a chapter to Woodrow Wilson's year as Governor of New Jersey, where his work and influence have accomplished more than the thoroness of his canvass as a Presidential candidate might lead us to suppose. Probably the author of this biography had not thought of writing a campaign document, but its value

on this side is not to be slighted. We wish that there were other candidates for the Presidency whose careers might yield as much of interest and inspiration!

The Bauble. By Richard Barry. New York: Moffat, Yard & Co. \$1.20.

Not every author would have the perspicacity and the courage to characterize his novel in its title. *The Bauble* is just that. Mr. Barry has a fixed delusion concerning the iniquity of the movement for woman suffrage which hampers him as a novelist. The heroine of *The Bauble* is a silly young woman who sees a suffrage parade and runs away from her husband because he "forgets to kiss the baby" and, incidentally, herself, when he comes home late to dress for dinner. The subsequent pages are a disgusting succession of unsavory episodes in the different camps of the suffrage army. The caricature of the leaders is broad and offensive. A belief in the justice of equal rights no more implies immorality and neglect of home duties than the conviction that there should be further tariff revision. Women like Julia Ward Howe, Mary Livermore, Frances Willard, Jane Addams, and many others whose names come to mind, are the best refutation of Mr. Barry's slanders.

Literary Notes

....Walter Camp of football fame has just published *Auction Bridge Don'ts* (New York: The Platt & Peck Company; 50 cents). If you play bridge you may buy this book; otherwise don't.

....From the Macmillan Company we receive a new edition of Sir Thomas More's *Utopia*, edited with a competently prepared introduction, notes and glossary by Professor W. D. Armes (pp. 346, 16mo, 60 cents)

....Readers will find in *A Life of Martin Luther* (Smith & Lamar; \$1), by Lovick Pierce Winter, an attractive and enthusiastic biography of the great reformer, based upon secondary sources. Special prominence is given to Luther's early development and his break with the Roman Church.

....Moffat, Yard & Co. have been publishing *Our American Holiday Series*, which aims to supply material in the way of prose and poetry for school use. The two newest volumes, compiled by Robert H. Schauffler (\$1 each), are "Flag Day" and "Independence

Day." These anthologies are varied in selection, each closing with practical suggestions for the teacher and settlement worker.

....The essays of Mr. Charles Brodie Patterson included in *Living Waters, or Rivers to the Ocean Run* (Funk; \$1.20) reveal the potential energies of the spirit and point to the fulfilment of life's ideal by working in harmony with its higher laws and thus establishing a spiritual dominion over environment.

....A new edition of President King's volume on *The Ethics of Jesus* has been issued by the Macmillans in their "Standard Library" series (50 cents). The careful scholarship and sound judgment which characterize the book have already been noticed in these columns. It is commended to students of the gospels.

....To claim that we are all on *The Road To Joy* (Harper; 50 cents) is the mission of Louise Collier Willcox. She adopts a certain axiomatic style that, mingled with varied anecdote, is somewhat diverting. She preaches against the gospel of pain, glorying in the militant struggle which should gain us the joy of the world.

....The moral and religious relationships between Christianity and Mohammedanism as they have been developed and revealed by missionary activity are discussed with fulness and breadth of knowledge by that veteran missionary of the American Board, Rev. George F. Herrick, in his new volume entitled *Christian and Mohammedan: A Plea for Bridging the Chasm* (Revell; \$1.25).

....*The Child of the Dawn*, by Arthur Christopher Benson (Putnam's; \$1.50), an allegory or fantasy dealing with the hope of immortality in which the author attempts to "translate hope into visions," makes a mild appeal to the speculative faculty and no doubt will bring enjoyment to many of the readers (for they are many) who have found beguilement heretofore in Mr. Benson's ruminations.

....The sub-title of Angie Warren Perkins's *Our Year Abroad* is "Random Rambles in the Old World," and the volume is illustrated with pen and ink sketches by the author and from photographs (Badger; \$1.50). The travels recorded range from Great Britain and Ireland to France, Switzerland, Spain, Germany, Austria, Norway, Russia, Italy, Egypt, the Holy Land, Turkey and Greece. Altho there is nothing distinctive about the style or content of this volume the author is an intelligent traveler whose chapters stand the test of comparison with the other travel books which crowd our shelf.

....We have welcomed Dickens, Scott and Thackeray dictionaries, but a *Dictionary of the Characters and Scenes in the Stories and Poems of Rudyard Kipling, 1886-1911*, is more of a surprise (Dutton; \$3). Mr. W. Arthur Young has apparently made a thoro job of it, and after providing a list of the books which is in effect a *catalogue raisonné* of generous proportions, and a dictionary of the stories, poems, characters and scenes, closes his volume of over two hundred pages with an indispensable subject-index.

....*The Woman from Wolverton*, by Isabel Gordon Curtis (Century; \$1.25), is the narrative of a simple village woman caught in the complexities, snobberies and impositions of the life of diplomatic society in Washington. The book will be of especial interest to Congressmen's wives, victimized by their husbands' constituency and by social sharpers in the capitol city. But it is doubtful whether the woman from Wolverton will be considered by feminine readers the best type of a "home-loving, patriotic, helpful and loyal wife."

....*Daily Bread*, by Wilfrid Wilson Gibson, is a series of studies in the lower stage of human life—scenes in dialog, dramatic in form, but of the unrhymed staccato order of verse, page-filling, each scene independent of its neighbor, and each with its individual group of sufferers vividly presented—all life moving to one measure and little sunshine playing upon the *dramatis personae*:

"Daily bread, daily bread—
Bread of life and bread of labor,
Bread of bitterness and sorrow,
Hand to mouth, and no tomorrow,
Dearth for housemate, death for neighbor."

(Macmillan Company; \$1.25.)

....*A Literary and Historical Atlas of Europe* (Dutton; 70 cents), compiled under the direction of Dr. J. G. Bartholomew and issued as a volume of "Everyman's Library," will serve admirably to furnish the lover of history and literature with such geographical information as is needed to make clear his general reading. Besides the customary historical maps and plans, which are well done, one finds such unique additions as a map of the realm of Arthurian romance, one locating places mentioned in Dickens's works, and another to accompany the reading of "The Cloister and the Hearth." An excellent gazetteer and complete index make the little volume valuable for reference.

....The close relation existing between religion and economic progress, and the application of the law of the survival of the fittest to religious and ecclesiastical institutions, have never been more convincingly set forth than

in *The Religion Worth Having* (Houghton Mifflin; \$1), by Prof. Thomas N. Carver, of Harvard. That certain types of religion favorably affect their adherents in the economic struggle, Professor Carver contends, may be one explanation of the separation of the Churches from the "masses," and this separation is not to be construed altogether as a reproach against the Churches, but at least partially as a tribute to their successful emphasis of those virtues which make for social and economic superiority. A religion which promotes social efficiency, and economic and racial progress, is, according to Professor Carver, the only religion worth having. The style of the volume is pungent, incisive and clear.

....Mr. Robert C. Morris, who was counsel for the United States in 1903 in the arbitration of the Venezuela claims, has made a valuable little volume out of his arbitration lectures delivered at the Yale Law School (1904-11) which he has entitled *International Arbitration and Procedure* (New Haven: Yale University Press; \$1.35). Tho the book is more historical than philosophical, we especially commend to students and peace advocates the author's treatment of the question as to whether "independence," "vital interests" and "honor" are susceptible of arbitration, which, of course, he demonstrates they are. Those who have followed our great peace President's speeches in behalf of the ratification of the arbitration treaties with England and France will appreciate Mr. Taft's statement in the "Foreword" that he is "indebted to Mr. Morris for much information contained in the volume."

....Centenaries are in these days madly celebrated by all the world. The year 1912 is distinguished by two more-than-centenaries: both of them recalling geniuses of an incalculable value in French history, and therefore in world history: Jean Jacques Rousseau and Jeanne d'Arc. It would be hard to find two names more ill assorted: the heroine of the *vieille France*, and the demi-god of French republicanism. Rousseau was born at Geneva in 1712; Jeanne was born at Domremy, in Champaign, five long centuries ago, on January 6, according to the best authorities. Book-making and essay-writing about these figures, equal only in their distinct kinds of picturesqueness, has been tremendously stimulated. So far none of the essays on Jeanne drive out of mind what the poet Vigny wrote in his "Journal":

"She remains the Virgin, and the poets have always missed her. It was her destiny to be ever immaculate, even in poesy, and to find no conquerer. From Chapelin, who first fell at the feet of her virginity, down, she has yielded no one a triumph."

Pebbles

"My wife," said Mr. Clarke, "sent two dollars in answer to an advertisement of a sure method of getting rid of superfluous fat."

"And what did she get for the money? Was the information what she wanted?" asked Mr. Simmons.

"Well, she got a reply telling her to sell it to the soap man."—*Harper's Monthly*.

"Is your Mississippi River very much larger than our Thames?" asked an English lady of a Western visitor.

"Larger?" answered the Westerner; "why, ma'am, there ain't enough water in the whole of the Thames to make a gargle for the mouth of the Mississippi."—*The Edinburgh Review*.

A TYPICAL Southern "mammy" entered the office of a well-known attorney, and, after mopping her shining brow with a bandanna handkerchief, said to the man at the desk.

"Ah wants t' git a divo'ce f'om mah husban', Mose Lightfoot."

"On what grounds?" asked the attorney.

"He's jes natchelly wufless," was the reply.

"What is your husband's occupation?"

"He jes sets roun' de house all day and p'tends to mind de baby."

"Does he take good care of the child?"

"'Deed he do not! He is too lazy. Dis mawnin' he tried to make de dawg rock de cradle by tyin' its tail to one ob de rockers."

"Did the scheme work?"

"Land sakes, no! Mose am so evahlastin' grouchy dat he couldn't speak enough kind words to make de dawg wag its tail!"—*Judge*.

SCHOOL ROOM ECHOES.

Sadie Wilpan, 8A12—An author is a queer animal because his tales (tails) come from his head.

E. Kanzer, 7A14—Wind is air in a hurry.

Teacher—Where is Lyons?

Weinstein, 7A13—In a menagerie. (Lions.) (Lions are, Weinstein, my boy.)

Sigmond Ordinsky, 7B5—My shoes are sore since last week.

M. Cohen, 7A2—That rubber belongs to my possession.

L. Feinberg, 8B15—The Vulgar (Volga) River is in Russia.

Gertner, 7B7—He is losing his tempest (temper).

D. Boss, 8A2—The people that come to America found Indians, but no people.

II. Levenstien, 8A7—The Brooklyn Bridge is a co-ordinate conjunction connecting Manhattan with Brooklyn.

A. Teskofsky, 8B1—Shadows are rays of darkness.

C. Bernstein, 8B11—Lincoln wrote the address while riding from Washington to Gettysburg on an envelope. ("It's true," said one of our editors on seeing this.)

—*School Sixty-two*.

130 Fulton Street - - - New York

A WEEKLY MAGAZINE FOUNDED IN 1848
One Year, \$3.00 Single Copies, 10 Cents

Single copies over six months old, 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as those offered by any responsible agency.

An order for the change of an address should be received two weeks before the change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of the publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. Even so, we cannot hold ourselves responsible for their return. Authors should preserve copies of their manuscripts.

Advertising rates will be furnished on application.

President Taft's Reciprocity Letter

It has been ordinarily expected that the blunders of the Presidential campaign would be with the Democratic party; this year they are with the Republican party. The one great blunder, one which is disrupting the party, is that which sets President and ex-President against each other, charges made first by Mr. Roosevelt, then denied by President Taft; then repeated with mutual recriminations and charges of misrepresentation and duplicity, such that were either nominated the other could not vote for him; and their adherents so hot with passion that it is not possible for them to cool their heat into complacency before the election in November. Conditions could not be more deplorable, and the wiser Democrats need not busy themselves too actively in politics, for it is enough for them to sit on the fence and laugh.

We do not wait to delay over the absurd tactical blunder in Massachusetts by which the delegates at large were allowed to be delivered over to Mr. Roosevelt, altho a handsome majority gave

their preference for Mr. Taft. The ambition of one man to be a delegate thrust his impertinent name on the ballot and "queered" the whole election. What are managers and bosses for if it is not to prevent such stupid blunders? Mr. Roosevelt had the sense and decency to absolve his electors from the duty of voting for him, and to ask them to vote for his rival. His action was in form, and, we are willing to believe, in spirit also, generally illustrative of the "square deal" and of justice. We do not care to train with the suspicious who see in Mr. Roosevelt's action political cunning more than the decent honor which the face of his action bears. It is better to give credit than it is to delve for discredit.

But it is a more serious blunder we must now speak of, that of President Taft in publishing his private letter to Mr. Roosevelt with the latter's answer, proving thereby that Mr. Roosevelt, who now denounces the Canadian treaty of reciprocity, favored it when it was before the people. Why did not Mr. Taft rest satisfied with publishing Mr. Roosevelt's reply and leave his own letter in prudent silence? It has now stirred up Canada and Great Britain, has been discussed in the British Parliament, and given rise there to the question whether Ambassador Bryce would not be recalled.

Mr. Taft's "confidential" letter to Mr. Roosevelt was dated January 10, 1911. It was a courteous and friendly letter, and sought Mr. Roosevelt's support of Canadian reciprocity, at least that he would not attack it. In it occurred this passage:

"The amount of Canadian products we would take would procure a current of business between Western Canada and the United States that would make *Canada only an adjunct of the United States*. It would transfer all their important business to Chicago and New York, with their bank credits and everything else, and it would increase greatly the demand of Canada for our manufactures. I see this is an argument against reciprocity, made in Canada, and I think it is a good one."

Now, could not any one have seen in advance that it would never do to publish it as the opinion of the President of the United States that in seeking reciprocity we hoped to make Canada "only an adjunct to the United States"? Could it not be seen that it would be easily

twisted into the confession of a plot against Canada? It has been so interpreted, and it has probably spoiled the chance for reciprocity for a generation to come. To be sure, Mr. Taft was chiefly favoring it as a lowering of our tariff, and he thought of a financial and not a political adjunct; but there it stood, a confession, in words, that the jingo attacks on reciprocity in Canada were justified, and that Champ Clark's indiscreet language at the time was only a frank admission of what our Government was seeking. That speech of President Taft in Massachusetts, containing this letter, was read and discuss in the Cabinet nearly all night, and they allowed it to pass. Mr. Taft has not been well served by his official advisors on this and other occasions.

So far as the public can judge from what is made known, Mr. Taft has entered the campaign against Mr. Roosevelt urged on by his Cabinet. The two men had been close friends. Mr. Roosevelt did his best to secure Mr. Taft's nomination and election. So far as we can see, President Taft remained true to that friendship until he was severely attacked by Mr. Roosevelt. We believe that both men meant to do what was right, and, however they might differ in policy, bitter words should have been withheld. It does not seem to us a tactful thing that Mr. Taft should have gone to Massachusetts just before the primary election to rebut Mr. Roosevelt, goaded on tho he was. There ought to have been tact enough in the Cabinet to prevent such an unpretty exhibition of the difference between the two, rising into hostility. And now that inept Cabinet tells Mr. Taft to publish a confidential letter which provokes Canada, astounds England, and makes Champ Clark shake his sides with hilarious delight; and all the rest of the Democratic party laughs and crows, while waiting for the hour when it will have to forget for a time the Republican blunders in the difficulty it will have over the two-thirds rule, and the hitherto futile attempts of William J. Bryan to disrupt the Democratic party, as Mr. Roosevelt has succeeded in disrupting the Republican party. When the conservative Har-

mon has been brushed aside, and Wilson and Clark have eliminated each other, and the minor candidates have been crowded out, who will be left but William J. Bryan for a fourth time—and we suspect that he, or any other candidate, could be elected.

That Japanese Religious Conference Again

It is a remarkable fact that only one sect of the Buddhist priests raised any objection to the meeting of representative Buddhists, Shintoists and Christians at Tokyo, at the request of the Japanese Government, to consult together and act together for the improvement of the moral conditions of the country. We have heard not a breath of criticism from Protestant or Catholic Christians in Japan or in the United States. We recall no meeting to be compared with it at any place or time previously, except the World's Interdenominational Conference of Religions in Chicago at the time of the World's Exposition there. But that had no particular purpose to accomplish, further than to advertise the exposition; and we recall that it gave occasion to an interdict from Rome against such a meeting thereafter. Perhaps this meeting was not regarded by the one Catholic representative and his advisors as coming under the interdict; or, perhaps, that was forgotten. We have waited to learn if any criticism would appear in this country, but we have observed none.

Now, what does this mean? Simply this, that all religions have a common basis of morality; and for the protection of their common morality they can properly unite. Any religion is better than no religion. The head of the Paris gang of murderers just captured and killed declared himself by his will a foe to all religion and morality. The world was his enemy and he the enemy of the world. That marked his brand of anarchy. It was such enemies of morals and religion that attempted to murder the Japanese Imperial family; and it was this outbreak of crime that led the Japanese Government to seek the aid of religion to support morality.

It is not any evidence of lack of faith in their religion or love of it that has given occasion in this country to the fellowship of Protestants, Catholics and Jews in not a few efforts for the public welfare. They work together for temperance, for health, for the moral uplift in every way.

The last illustration that comes to our hand is the report of the Committee of Fourteen, whose effort it is to reduce the number of disorderly houses in this city. We observe in the list of directors Christians and Jews indiscriminately engaged in the one great work of suppressing commercialized sexual vice. This committee has done fine work in the past, particularly in closing nearly all the Raines law hotels, mostly resorts of vice, and in securing legislation which makes conviction easier. It tries to shut up disorderly houses, and put an end to soliciting in the streets. Certainly such an end is one in which all Jews and all sorts of Christians can properly unite and without compromising their faith.

Religion is not all ethics, but all ethics is embraced in religion and commended by it. The Ten Commandments of Sinai not only begin with the worship of God, but they end with those duties to man which are the essence of common morality. The Apostle James teaches us that one cannot be religious who is not moral; because the visible neighbor is more tangible to human sense than the invisible God.

Thus all religions, whether true or false, have at least one common object, to teach what seems to them good morals and to lift up society. In Japan they have begun to understand this, and so Shintoists and Buddhists and Protestant, Catholic and Greek Christians could accept the wise invitation of the Secretary of Home Affairs; and so in this country Protestants, Catholics and Jews are working more together and less apart. They no longer fight. They respect each other and honor each others' good works. They worship a common God, tho each in his own way, and they look to a common Heaven. We remember that when Montefiore died the Professor of Theology of Princeton Seminary told the readers of THE INDEPENDENT that he had no

theology which did not welcome the aged and pious Jew into the Christian Heaven. That theology would be a hateful theology which could shut the gates of Heaven against good men. Those who can be welcomed by angels above can join hands here for the uplift of man. And why not join also with Buddhist and Shintoist in Japan? In every land, and under whatever imperfect faith, is not he that feareth God and worketh righteousness accepted of Him? We understand this better than of old; and so in these days our missionaries abroad do less fighting and more drawing than they did. They attack Buddha less and preach Christ more; and the result follows in greater success. Courtesy and charity catch more converts than the vinegar way. There is yet room for even more charity and courtesy among believers here at home also.

The Coming Era of Happy Dulness

Is there to be an end of discovery and invention? In our conquest of the world and victory over nature will there be nothing left to find or learn, and shall we reach a level of contented attainment, because there will be no new secret to be discovered, no new power to be sought and secured? Will all debate over social questions end in their answer, and shall we reach a happy uniformity of monotony?

The earth is nearly conquered now. We have reached the North Pole, and within a few months expeditions have reached the South Pole, and it has been proved that no one need go there again. Africa will soon be gridironed with railroads, like Europe, and South America will follow. Soon there will be no unknown regions for adventurers to explore; and a century or two later the whole habitable world will be possessed by busy residents. We can already anticipate the time—for it is coming fast—where there will be no call for emigration to seek cheaper land.

But how with inventions? We had before conquered land and sea with our railroads and our steamships, and now within the last five years we have made

sure the conquest of the air. Earth, air and sea—there are no more elements to subdue, for fire is also our servant.

But beyond air, earth, sea and fire, included in and including them all, is the ether, and that too not only serves to connect us with the sun and stars, as it has done of old, but it begins to learn how to be the obedient errand boy of man. What more it can do for us we do not know, but we are likely to know before long. We shall know how, for already we begin to guess, how the chemical elements are made out of it, and how they may be transmuted. Possibly in a later age we shall learn how to break them up and there find a supply of heat when our coal mines are exhausted, if we do not prefer to take our heat from the winds and tides, or store it up more directly from the sun. There are not likely to be any other great chemical or physical discoveries which will much affect the conditions of humanity; or, if there should be, the army of laboratory workers will before very long have nearly exhausted the hopeful clues.

We may also expect that the social experiments that have to do with the relations of men to each other, as employers and employees, rich and poor, strong in mind and weak, men and women, the rival forms of government, democratic or socialistic, or anarchistic, will in the course of some generations get threshed out, and we shall learn what is best. We shall get rid of the industrial evils we now condemn, and equally of those other destructive forces that fight social morality and domestic peace; for we are nearing a victory over them.

At least we may hope so. If not the alternative will be social convulsion. A happy conclusion is bound to be reached unless the conflict destroys the order of society and government, culminating in internecine civil war. We can imagine those who would preserve a system of orderly government met by a disciplined combination of anarchistic forces and swept down to defeat. Such a defeat, or even a victory, might much more than decimate the world. It even now looks as if the advance in civilization, with its strata of society, were likely to run its course in race suicide and consequent depopulation. One nation after another

is ceasing to reproduce its kind. How will it work two centuries from now? There must come somehow a change in the progressive diminution of the birth rate, so marked in France, Great Britain and the United States, or their decadence and the end of their civilization will come; and what we see here we must expect in the rest of the world somewhat later. Equally if the industrial conflict now so severe does not find some relief the most ominous results will follow.

But, in the words of Scripture, we are persuaded better things, tho we thus speak. The tremendous problems before us must find a solution. The human mind must be equal to it. There will be no dulness in the world while the solution is being sought. There will be a realignment of social ethics, a new political economy, a new Christian civilization. It is because we believe that truth when free has inherent strength, and because justice and love, righteousness and peace are mightier than selfishness, that we rest in the conclusions of optimistic idealism. And when the victorious conclusion is once reached, a century or two hence, and the mastery of science over nature has been, as it would now seem to us, achieved, even then we cannot believe that the infinitely large and the infinitely small, which make up the great Infinite with which we are concerned, will have been all mastered. There will ever be more to learn, new conquests to be made, so long as man falls short of the omniscience and omnipotence of God. In Dante's, Shakespeare's, Milton's day the range of knowledge was very limited, and one life could very nearly embrace it; now no man can know more than one small specialty, and he must only gaze blankly on all the rest. In the day of fuller knowledge that is coming, if the unattained possible is narrowed, the attained known will be greatly widened, and there can be no stale dulness of monotony in the student's life even in striving to embrace the already attained. And the old questions of philosophy will remain for the speculative mind:

"Of Providence, Foreknowledge, Will and Fate."

and the higher questions of personal duty and social duty, which can never grow stale.

The Industrial Workers

It is not easy to keep track of the labor movement. This may be evidence that the movement is both extensive and energetic. Collective action, like individual behavior, breaks out in irregular and unexpected ways when there is vigor back of it. And the more abundant the overflowing energy, the more radical are some of the actions likely to be.

It is plain that in every part of the western world the labor movement is becoming more energetic while becoming also more complicated, more determined and more revolutionary.

On various occasions we have called attention to new departures that have left parliamentary socialism so far behind that it begins to look almost like a conservative social force. It is true, of course, that the socialistic movement is bigger than parliamentary socialism, and it is yet to be determined whether the International Socialist Congress will "stand for" the "direct action groups." If it is compelled to do so socialism will for a long time to come have a conservative and a radical wing, and the radical wing will probably frame the platforms and dominate the policies.

But the Socialist movement is by no means coextensive with either "the social revolution" or the labor movement. The syndicalist groups include socialists and anarchists. So also do the trade unions. At present the syndicalists are on the whole impatient of parliamentarism, and this is true also of the trade unions. Without being identical, syndicalists and trade unions are in agreement that "direct action" is more likely than political action to achieve practical results for wage earners. All syndicalists, however, have a revolutionary program. They demand the abolition of capitalism, and aim to overthrow the existing social order. The trade unions have hitherto accepted the capitalist system, and have devoted their efforts to obtaining immediate concessions for the amelioration of the wage earners' lot.

But now the revolutionary spirit is invading the trade union organizations. It threatens even to put the existing trade unions out of business and to substitute for them a new plan of labor organiza-

tion. The new plan is represented in America by the Industrial Workers of the World, who are exhibiting an aggressiveness out of all proportion to their numbers and their resources.

The organization of labor on craft lines has never been entirely satisfactory. It leaves the great body of unskilled labor unorganized, uneducated in labor policy, and undirected. From such a body strikebreakers can always be recruited. Also, as Tolstoy has argued, it creates an aristocracy, or privileged class, within the ranks of wage earners, and thereby imposes a serious obstacle to "labor solidarity."

The Knights of Labor movement in America was an attempt to substitute a general organization for craft unions. It went to the extreme of ignoring not only trade lines, but also industrial divisions, and tried to bring wage earners, irrespective of their occupations, as well as of their gradations of skill, into local assemblies. These were too miscellaneous for effective co-operation, and after a rapid growth, culminating in 1885, the organization met with disaster in the great strikes of 1886 and rapidly went to pieces.

The Industrial Workers have a more scientific plan. They propose to substitute organization by industries for organization by trades. The idea is to bring together for effective common action all workers in all trades that have a part in producing a finished product ready to put on the market; for example, compositors, pressmen, stereotypers and other skilled groups employed in getting out a newspaper.

With "industrial" organization the Industrial Workers would combine a policy of vigorous "direct action." This phrase stands for many different things, from violence and sabotage to "passive resistance." We understand that sporadic acts of violence are discouraged as bad policy, the idea being that violence should be resorted to only when it can be waged like a revolutionary war, by extensive and well-organized collective action. As to sabotage, opinion within the ranks of the Industrial Workers appears to be divided.

Probably chief reliance is placed upon the "industrial" or "general" strike, and

there is no difference of view upon the importance of terminating all time agreements between organized labor and employers. Agreements may be made covering all other relations, but, as the Industrial Workers see it, labor must reserve the right to quit work at an instant's notice, so that as many groups as may be desired can be marshaled in a general strike.

Underlying the policy of "direct action" in all its expressions is a doctrine or assumption which sharply marks off Industrial Workers and syndicalists from the older socialists. This assumption is that the most effective way to bring about the abolition of "capitalism" is to impede and limit production. This assumption, or philosophy, has been taken over from the trade unionism of the machinery-smashing days. Constructive socialism, on the other hand, asserts the importance of continuous and increasing production. It even welcomes the capitalistic combinations or "trusts" as devices that will be of value when mankind substitutes collective or social ownership for class or capitalistic ownership of the means of production.

Inevitably, a great and increasing body of organized wage-earners, proclaiming a revolutionary purpose, dogmatically believing that the destruction of capital and the curtailment of production are effective means for their purpose, appealing to the least educated elements in the industrial population, and teaching them that they can do their part in the work of overturning society by mere opposition and destructiveness, will be lawless in action. The Industrial Workers openly declare their lawlessness and glory in it. William D. Haywood, their chief, speaking at Cooper Union on December 21, is reported to have said:

"Can you wonder that I despise the law? I understand the class struggle. I am not a law-abiding citizen. More than that, I do not believe you here ought to be law-abiding citizens. . . . Let us Socialists be frank. We want to overthrow the capitalist system and establish in its place an industrial democracy. Why then say we are law abiding?"

Such words call for no comment. They are a declaration of war. The Industrial Workers cannot with reason complain if society takes them at their

word, and proceeds against them as disturbers of the peace, with measures that the older socialism has neither merited nor provoked.

Politics and the Cost of Living

IN the political field at the present time there are vigorous campaigners who appear to ignore an issue of great weight, the rising cost of the necessities of life. Last week's market reports showed that the price of beef had reached the highest point touched in twenty years. Large additions to the prices of mutton and lamb have recently been made. The prices of pork and canned goods are very high and will soon be higher. To the wholesale price of wheat flour 40 cents per barrel has been added in thirty days. Those who buy potatoes know that the cost of them is almost without precedent. The owner of a meat market in a city of New Jersey closed his shop last week, saying he had not the heart to demand the prices which would give him a slight profit. To some, of course, continuous and large advances in the cost of the most ordinary articles of food have but little meaning. But the masses, and especially a large majority of the residents of manufacturing towns, find them painfully interesting, and these masses include a great number of voters.

We have reason to believe that a great many of these voters ascribe the increased cost of their food to the Republican revision of the tariff in 1909 and to the Trusts. They really know little or nothing about tariffs, or trade combinations, or the extraordinary output of gold. They are quite willing to accept the assertion of Mr. Dix, the Governor of New York, that in 1909 the Republicans increased the duties on all the necessities of life. They have said to themselves and their friends that the word of the Governor of the greatest State in the Union, himself a protected manufacturer, should be taken without question. We presume they have come to regard the prosecution of Trusts as a sham. They know that the Beef Trust defendants were acquitted. They have recently been assured by the Republican ex-President of the United States that

the dissolution ordered for the Standard Oil and Tobacco Trusts is ineffective. Other prominent persons point out to them that the price of oil has advanced since the orders were issued, and that the wealth of the Trust capitalists, as measured by stock quotations, has been much increased since this action of the courts. We are talking now about those who are not able to make investigation and to reach just conclusions based upon their own careful inquiries; those who cannot, for example, ascertain for themselves that the Republicans in 1909 did not "increase the duties on all the necessities of life." Legislation concerning the tariff and the Trusts has been made by the Republican party, and the same party has conducted the prosecution of Trust combinations. If this party by what it has done in these fields has not prevented a large increase in the cost of living, and is accused by its opponents of causing or promoting that increase, it is not surprising that a large number of such voters as those we have been talking about want a change at Washington.

Let us see what the Republican leaders have been doing for the enlightenment and conciliation of such men. They have not attempted to prove that the higher cost of living is due mainly to causes not connected with tariffs or Trusts. A few days ago a prominent officer of the Government published a report in which little if any weight was given to growth of the annual gold output from \$113,000,000 in 1890 to more than \$450,000,000 last year. The proof, which the official record contains, that in the revision of 1909 the duties on all the necessities of life were not increased has not been earnestly and persistently exhibited. So far as the prosecution, successful or otherwise, of Trusts is concerned, the effect of it upon the cost of living could safely be neglected, for that effect is a negligible quantity. But it has been the purpose of the Government to prevent advances and the exaction of unjust prices as results of unlawful combination agreements. It is with respect to the tariff, however, that the Republican leaders have been notably unfortunate, from the point of view of those voters whose atti-

tude we are considering. The Democratic party seized its opportunity and passed, in the House, a series of bills aimed at the cost of living. Because of Republican opposition these were not permitted to become laws. The Democrats have recently passed again several of these bills, or bills of the same character, and Republican opposition again prevents the final enactment of them. But now the justice of these measures, in part, is conceded by the Republicans. They have surrendered their original position. To set up against a Democratic bill making an average reduction of 50 per cent. in the wool and woollens schedule a Republican bill carrying an average reduction of 40 per cent. is an admission and a surrender. It must be so regarded by the voters of whom we have been speaking. We are considering their attitude and point of view, and not the reports of the Tariff Board or the arguments of tariff experts.

The voters we have in mind care very little, we presume, about the recall of judges and decisions, or the initiative and referendum. But there are a great many of them, and they deserve to be addressed earnestly by campaigners. They were in evidence at the special election of 1910, in the Taunton, Mass., district, when a Republican majority of 14,250 was suddenly displaced by a Democratic majority of 5,600. Some of them were at work a few days later in the Rochester, N. Y., district, where a Republican majority of 10,160 gave way to a Democratic majority of 5,800. These special elections preceded by about seven months the general election which deprived the Republicans of the House and gave it to the Democrats by a majority of 66.

Quite naturally they are inclined to support the party which has shown by its legislative efforts a desire to reduce their absolutely necessary expenses, especially because a majority of them believe, we think, that they have been subjected to unjust exactions by the party now in power. So far as the questions and the voters we have been considering are concerned, that party has not a case of the greatest strength, it is true, but it should have made the best of such a case as it had. This it has not done.

Senator Smith's Examination

Senator Smith, of Michigan, conducting the inquiry into the causes of the loss of the "Titanic," spent quite too much time over the irrelevant question whether two of the wireless operators had the right to sell their story of the disaster to a single paper. That was an entirely foreign question, and had nothing to do with the cause of the tragedy. They had reached New York, and told their story by word of mouth to a reporter, just as the other survivors did to other reporters. While on the "Carpathia" and on the high seas they had no chance and no authority to send anything that the captain did not allow. It was not their fault that no story of the wreck was sent, nothing but the lives of survivors and the numerous personal messages. When they had reached New York they were as free as other passengers to tell what they pleased and to whom they pleased. If the wireless operator on the "Titanic" received \$1,000 and the operator on the "Carpathia" \$850 it was their business, and all they had to say was published as speedily as possible, but in the journal which had the enterprise to get exclusive news. That these poor men, meagerly paid, one of whom had lost all his belongings, and both of whom had been heavily tasked, got a handsome price for their stories, does not seem to us a wrong to Senator Smith or to the world. If the world had a right to the story as soon as possible, they got it, and from hundreds of people. The Senate Committee might well have devoted its entire energy to other ends. The reading of the examination by Senator Smith of Mr. Marconi and Mr. Sammis does not at all raise one's opinion of his competency for his task.

A Service Pension

Why there should be a further service pension bill we fail to see. That those who had been disabled by the hazards of war or the widows of those who died in the service or thru its exposures should be cared for is only just. We have had such laws, and they have been generously administered. But there were a multitude of others who were not a particle injured in health, and

who consider their period of service an honor and a privilege. That they have lived to a good old age is proof that they have enjoyed exceptional health and have been as well able to take care of themselves and their families as are other citizens. But this plain truth is not popular, and there is a loud cry from certain sources for all the money that can be got out of a supposed overflowing treasury. So the two Houses of Congress have agreed on a bill which gives a pension of from \$18 to \$30 a month to every soldier who survives, graduated by age and length of service from one and a half to three years. The cost to the treasury is estimated at about \$25,000,000 annually, but somehow estimates are usually too low. Our pension system is not a good one, and it has cost our country billions of dollars. However, it has served the purpose of increasing taxation and keeping up the tariff.

A Pessimistic Mood

It appears not to be a very cheerful note which the Methodist bishops present to the General Conference on the condition of their Church, half a million members during the quadrennium having been lost from the rolls by removal from one place to another without having taken and presented their letters within a year. The rule is certainly a reckless one, for we might imagine fifty thousand moved to Western Canada and being unable to make new connections in that time. We can hardly suppose that number lost to the Christian faith and life. But a more pessimistic note is to be heard in this statement:

"We face the patent fact that our distinctive doctrines are not being emphasized as they once were, or, where preached, are discredited for the time by a gainsaying world drunk with vain philosophies and sated with gluttonous indulgences."

If those distinctive doctrines are not preached as much as they were in the days when Wesleyanism was fighting Calvinism, all the better for Methodism. We believe the Methodist preachers are fighting the devil as hard as ever, if in a different way, and are doing as much to advance the Kingdom of God, which is

in a much more hopeful condition than it was in the good old days talked of. As for a "world drunk with vain philosophies and sated with gluttonous indulgences," that is rhetoric. It swells out the sentence, but the world is no worse than it was, and the advance in the comforts of civilization is no evidence to the contrary, nor the study of the sciences. The spirit of Christianity is constantly permeating more and more our legislation and our commercial affairs. We have bad forces yet rampant and militant, but we have destroyed slavery and restrained intemperance and other evils immensely since the days the bishops would recall. A note of cheer is rather called for.

✱

Dogs in Poetry The houn' of the Ozarks is not the first dog to nose his way into verse. At times, to be sure, dogs have been frowned upon by the poetasters; this was notably true in France. Racine was not afraid to use the word *chien* in the most exalted of his tragedies; but his degenerate followers quailed before the name as before the thing, and called it "*de la fidelité respectable soutien*." It is hard to believe that such was the state of literature in a land productive of a La Fontaine, an Edmond Rostand, and an Anatole France. "Riquet," the dog, is, as Georg Brandes asserts, "one of France's best characters": an admirable compound of naïveté and shamelessness. The "Thoughts of 'Riquet'" are a masterpiece of canine innocence and irony, as good in their way as the "Pensées" of Pascal or Joubert. Here are a few examples:

"Men, animals and stones grow larger as they approach me, and become enormous when they are quite close. It is not so with me. I remain the same size wherever I am."

"The smell of a dog is a delicious smell."

"I speak when I choose. From my master's mouth, too, issue sounds which have a kind of meaning. But their meaning is less plain than that which I express with my voice. Everything uttered by my voice means something. But from my master's voice comes much senseless noise."

"An action for which one is thrashed is a bad action. An action for which one is ca-

ressed or given something to eat is a good action."

"Riquet" shall have his place in our Book of Dogs—when we compile it. Since Shakespeare slighted dogs, in his plays, we must needs content ourselves with lesser poets, not forgetting the "Belgian Shakespeare." Neither shall we forget Champ Clark's national anthem:

Philippine Independence It cannot be said that the United States rules the Philippines with rigor so long as the Hon. Manuel L. Quizon, the Resident Commissioner from the Philippines to our Congress at Washington, is aiding the effort of Congressman Jones, of Virginia, to formulate and support a bill which provides for the complete independence of the Philippine Islands in 1921, after a period of qualified independence. We have received a letter from him explaining the bill, assuring his "heartly approval and co-operation," and requesting us, "in the name of justice and true Americanism," to give it our support. We cannot do it. Perhaps conditions may make it wise later, but the time is not now to make promises. The conditions of the bill appear to consider the interests of the United States rather than of the people. It would give the rule to a minority living in the second largest island, and practically to the city of Manila. We are responsible for all the dozens of islands, tribes and languages, most of which have scarce the rudiments of civilization. At least a generation of school training should precede any heedless laying down of our responsibility. We can trust ourselves to govern Mindanao for a good while yet better than can the Filipinos of Luzon. Our own easy government of the Islands appears in the fact that we allow the delegate from the Philippines, paid from the funds which we administer, to devote himself in Washington to the effort to seek independence, while the Speaker of the Philippine Assembly sends his congratulations and hopes for the success of the Jones bill. When Mindanao and northern and eastern Luzon and Mindoro and Samar and Negros and Palawan and other scores of islands are civilized, it will be time to consider the matter of independence.

Another Coptic Manuscript

In its issue of April 15 the *London Times* gives a facsimile of two pages of a fine manuscript found in Egypt of the Coptic translation from the Septuagint of Deuteronomy, Jonah and also of the Acts. It is one of the contents of the library of an ancient Egyptian monastery, most of which we described in our issue of January 11 as having come into the possession of the John Pierpont Morgan Library, and being edited by Professor Hyvernat. There has been no delay in the publication of this other manuscript, which has been purchased by the British Museum. The editors believe that it is of the fourth century, and so one of the very ablest biblical manuscripts in existence, and of value for the history of the Septuagint. We regret one comment with which this volume is introduced to the British public:

"During the last four or five years both European and native excavators have vied with each other in bringing to light the treasures of ancient Egypt, and among these which will be of priceless interest to all students of Oriental versions of the Bible are large collections of Coptic manuscripts on vellum, portions of which have found their way into the national libraries of London and Paris, and also, alas! into the bijou libraries of certain American millionaires.

Thus to speak of the success of the J. Pierpont Morgan Library, which is open to all scholars, and which freely publishes and distributes its treasures when published, is not at all handsome.

When we don't like a book **Be Honest!** let us be frank about it. It is the same with a picture, a play or an opera. Honesty without blatancy is the best policy. These truisms need refreshing today. A writer in the *Paris Figaro*, telling about "two absolutely bizarre picture shows" by so-called futurists, describes the cautious manner in which the public has moved thru them—seeing nothing but bands of thick color crossed by grayish streaks, like chimneys running up the outside of a house, but fearing to expose its ignorance by laughing at the monstrosities. Because Wagner was hissed and Manet laughed at, and both admired in the end, people recall the exclamation

of Anatole France's Monsieur Bergeret: "Suppose it should turn out to be a masterpiece!" They who reason thus are intellectual cowards. Let them laugh out. Good art conquers ignorant laughter: and laughter is often a more intelligent criticism of bad art than anything we read in the newspapers.

The American press **Automobile Pirates** has belittled the courage of the police officers who entered a garage in the outskirts of Paris and exterminated two of the band of automobile pirates who have terrorized the suburbs of the capital. We are not sure that the critics and cartoonists who have made merry over the siege of Choisy-le-Roi (which was a much less extravagant performance than last year's siege of Sidney street by Mr. Winston Churchill and his forces) would have shown as much courage as the Parisian police. It is easy to sit back in a swivel chair telling what one would do in such and such a case, and condemning "Titanic" survivors or others persons who have passed thru experiences which we ourselves have happily been spared. The important point about the case of the Paris banditti is, however, the determination on the part of M. Lépine and his men to make aggressive war upon the criminal classes of the capital. Paris has suffered in recent years from the stored up poison of a long period of false humanitarianism. The doctrines of Rousseau and his contemporaries express themselves today in every field of thought and action, and the flaccid sympathy which would spare the lives of murderers and worse, and which would regard imprisonment of habitual criminals not as punishment but as a kind of retreat provided by a benevolent state for persons of immoral distinction, has poisoned the body politic and the body social. There is an echo of all this in the attitude of the English suffragets, who bitterly complain because, having been arrested for felonies, they are not given a rosewater-and-afternoon-tea holiday in Holloway Jail. Criminals and "disorderlies," however polite their origin, will do well to note that the spirit of the times sharply reacts against the theory that the individual is superior to society.

Word Consolidation The tendency to consolidate two or more words into a single word is noticeable just now. There is one rule that ought to control this tendency. It is that a single accent allows a single word. Thus *onto* is better than *on to*, because *to* in common speech has lost its accent, as it has in *into*. So *inasmuch* carries but one accent, and there is one prevailing accent also in *nevertheless*. But it does not follow that we should write *insofar* because the Germans have *insofern* so long as we give equal accents on *in* and *far*. Half the printers have within a year or two begun to give us *anyone* and *everyone*, but not yet *noone* or *someone*. In these cases one has not lost its accent, and the consolidation is not justified by the use of *anybody*, *somebody* or *nobody*, where the last element has quite lost its accent. For this reason THE INDEPENDENT continues to print *any one* and *every one*, until the popular voice shall drop the equal accent on *one*.

Boxing in France Some years ago Maurice Maeterlinck wrote an essay, "In Praise of the Sword," in which he made slighting remarks anent the clumsy brutalities of boxing. Now, however, the mystic has published an article eulogizing "la boxe"—published it in *Les Annales littéraires et politiques*, a weekly journal which has for its constituency much the same public as, in America, divides its time between *The Ladies' Home Journal* and *The Youth's Companion*. And M. Maeterlinck will, it is said, box with the middle-weight champion of Europe in a charity exhibition to be held in Paris, the playwright Tristan Bernard being another of the French *littérateurs* who will put on the gloves. France is today much occupied with the ring; in conversation and in the press there are constant reminders of the fact. National pride is pleased, also, that a young Frenchman—his name is Georges Carpentier—is the premier boxer of Europe. At the same time there is a revival in the military spirit. But there need be no loud lamentation at all this. There are ebbs and tides in every sort of feeling—humanitarian, moral and patriotic.

Yuan's Presidential Message Apparently the Chinese Republic is holding its own at present, and Yuan Shih-kai, the President at Peking, has presented his first message to the provisional Senate. It was a pacific document so far as foreigners are concerned, but the financial policy is a troublesome one. There are treaties with foreign nations as to customs duties, such as have hampered Japan until within the last year. Yuan is not afraid to engage foreigners as financial advisers and experts, and beyond doubt a considerable loan will have to be negotiated, which it were desirable should be floated at home, if possible. What will be an example to other nations, he says the number of soldiers is too large, and they should be reduced in number. Religious liberty is promised. It appears to be an excellent document and has made a good impression, but the question of a loan is a difficult one. China is not yet out of deep water, but there is more hope of final success than most foreigners were ready to admit a few months ago.

We wish to have the final story of Mr. and Mrs. Isidor Straus put on record in these columns. Colonel Gracie heard them discussing the matter between themselves, and agreeing that if they must die they would die together. So when the officers urged Mrs. Straus to enter the lifeboat she refused to leave her husband. "We have lived together all these years," said she, "and I will not leave you now." No persuasion could move her. Then, says a survivor, Mr. Stengel, the officers tried to make an exception in favor of Mr. Straus. "We told him," says Mr. Stengel, "that no one objected to an old gentleman like him going in the boat. But he said he would not leave till the other men did." Their story will go down the ages. It has been the subject already of hundreds of poems.

The Methodist General Conference has a puzzle to solve at its meeting this month. The negroes want a negro bishop for their churches; but the rules of the Methodist Church do not allow any bishops but those that have general jurisdiction, so that a negro bishop might

preside over a white conference. The way to get over that law is suggested by the cases of the missionary bishops. The residence of a bishop may be placed in China, in which case his duties would be confined to Chinese conferences. To elect a bishop for colored conferences would be unconstitutional, but he might usually serve such conferences and occasionally be assigned, say once in ten years, to other conferences. We wait to see how this old sore question will be solved.

When the Christian Unity Foundation, an unofficial body composed of members of the Episcopal Church, sought conferences with Presbyterians, Congregationalists, etc., with a view to considering whether they could be brought in any way into corporate union, the latter consented to meet them. But a similar invitation to leaders in the Reformed Episcopal Church was declined, on the very ground that it was not official, and that the Episcopal Church did not recognize their orders, and for this reason refuses to join the Federation of Churches. Even so one might think the invitation to a conference might have been accepted, particularly when it might be presumed that those who sent it did not represent the exclusive attitude of the Episcopal Church.

Here is yet another indication of an educational and religious movement which is bringing together various Christian bodies. Lombard College, at Galesburg, Ill., is under Universalist control, and has under its auspices a theological seminary. This Ryder Divinity School is moved to Chicago, and becomes affiliated with Chicago University, and President L. B. Fisher, of Lombard College, will become its dean. The students will get their general training in the regular divinity school classes of the university, while he will teach the special theology and history of the denomination. This plan gives breadth and sympathy between the ministers of different bodies.

Dr. Grenfell says dogs are fine for Arctic journeys, but they are half wild and he would have them exterminated

and reindeers take their place. The missionary dogs at Hopedale tore a boy to pieces. At Cartright Mr. Bird's dogs tore to pieces his boy of five years. At Battle Harbor Mr. Rumbolt's dogs turned on him and killed him. Mr. Lane's dogs at Bigbay ate their master. They are treacherous friends, says Dr. Grenfell. The Eskimo dog kills cattle and prevents civilization. It is better to have more vegetables, sheep and hens and fewer dogs. The lesson of fewer dogs applies to temperate zones. The higher the civilization the fewer the dogs.

Do our readers apprehend how closely the various denominations are now being affiliated, after the manner of the chief of them, the "Federal Council of Churches in America"? A conference of their representatives, to be held in June at Silver Lake, includes the Laymen's Missionary Movement, the Missionary Education Movement, the International Committee of the Y. M. C. A., the Sunday School Council, the International Sunday School Association, the denominational brotherhoods, the Gideons, and the Young People's Societies. For all these, and others, we presume, the Federal Council acts as clearing house.

In its number of communicants the Disciples are one of the very largest Protestant denominations in the country. They claim the greatest breadth, and have no formulated creed. But of their two leading journals, *The Christian Standard* is devoting its editorial strength to proving that *The Christian Evangelist* is recreant to the faith in that it does not sufficiently condemn those of that body—and one missionary in particular—who believe that it should be left to the member himself whether he should be immersed. Thus standing for "the Bible alone" becomes the slogan for formal ceremonialism, the letter for the spirit.

It will be remembered that a station master in Japan lately killed himself in atonement for the delay of a train which the Emperor was to take, altho himself not at all to blame for its being late.

We find in a French journal the statement that when it was proposed to erect a monument to the memory of the suicide, President Yamakawa, of the Kyushu University, protested against thus honoring the act, and popular indignation against him was so intense that he had to resign. He had further incurred disfavor because he had, on the occasion of a fire tried to save the life of a man before saving a portrait of the Emperor.

The suffrage parade on Fifth avenue last Saturday exceeded all expectations. Fully 10,000 women marched, and a very fine appearance they made. They clearly exemplified the best types of our womanhood, representing as they did all ages, classes and occupations. The crowd was plainly sympathetic. This shows a change of attitude since last year's parade, for then the marchers were jeered. It must now be apparent to all that this movement for liberty, equality and sorority will not end until all the women are enfranchised. We are proud that THE INDEPENDENT has supported the cause for over sixty years.

A writer in *The Spectator* discovered that the new "Concise Oxford Dictionary," published as an abridgment of the great dictionary edited by Dr. Murray, gives "idee" as the proper English pronunciation of *idea*. Thereupon a number of correspondents discuss the matter, mostly, we are glad to say, in criticism, but one writer, probably from the south of England, declares that this is the correct pronunciation, and that the final syllable of *idea* has exactly the same pronunciation as *dear*. This is sad.

So Russia will not participate in the Panama-Pacific Exposition at San Francisco. We are not surprised. It is a courteous way of expressing dissatisfaction with the action of our Government in terminating the treaty with Russia because of the exclusion by Russia of American citizens of Jewish faith who wish to visit that country. It may be said in extenuation that the sore famine in Russia makes a good reason for not

going to any expense beyond what is necessary for battleships.

In Great Britain the Post Office Department owns and runs all the telegraph lines. The United States is away behind the world in postal matters. Now the British Post Office has made a contract with the Marconi Company to send wireless messages from England to New York at the full rate of 16 cents a word, or, for deferred messages, 8 cents a word, which is 4 cents less than at present by cable. Perhaps the development of the work of the post office may be regarded as a measure of a country's civilization.

Mr. Roosevelt protests that there is no such thing as "tyranny of the majority" in America. Generally speaking, no; but what does he say to the case of Chester County, Pa., where the prosecuting attorneys have found it impossible to convict any of the Coatesville lynchers, so strong is public opinion on the side of murder by mob? Yet Chester County is, in the main, an orderly community; its citizenship is overwhelmingly Republican; the stock is Anglo-Saxon and to a large extent of Quaker ancestry.

To add to the pension bill an appropriation of fifteen to twenty million dollars for good roads is loading postal charges in an unusual way; but does not the rural free delivery service require good roads and will not the Congressmen be glad to turn over to the general government the expense, as far as possible, of meeting local charges? We might as well add a provision that inasmuch as mails are carried on the railroads the Government should buy the railroads.

It is not strange that on returning from a trip on an excursion steamer which sailed from New York to South American ports, about the Horn as far as Valparaiso, Chile, and return, where they saw at no port a single steam merchant vessel carrying the American flag—it is not strange, we say, that 101 Americans on their return to New York signed a protest against the law which forbids any but American-built vessels to carry the American flag.

Insurance

Ungraceful Losers

THE cable dispatches this week bring the interesting information that the Supreme Court of Austria has sustained the position assumed by the Austrian Phoenix Fire Insurance Company toward their San Francisco claimants for losses incurred in the conflagration of 1906. The aggregate sum involved in the suits is about \$40,000, judgment for which was awarded against the company by the California courts. As it had hurried out of the United States immediately after the San Francisco disaster, the judgment remained unsatisfied and the claimants were compelled to transfer their suits to the Austrian courts, with the unfavorable result mentioned. The highest Austrian tribunal holds that the California judgments are ineffective within its jurisdiction, and that, as no original action had been begun there within the one-year period provided for in the policies, the claims were proscribed.

How different in character and quality is this brand of justice from that which is dispensed under the laws governing English and American insurance companies! The California courts listened to evidence which went to the merits of the claims and pronounced the latter valid; the Austrian court hears no evidence respecting validity and throws out the claims on a technicality, ignoring the mighty fact that when confronted with its honest duty the insurance company shirked it.

As an underwriter, the Teuton of Europe appears to be a bad loser. The experience of American policyholders with some of them has been of a kind not calculated to inspire that feeling of attachment for them and their policy contracts, which is so highly valued by insurance companies generally. As well as we are able to recall the circumstances, there were at least two German companies involved in the San Francisco conflagration—the North German and the Transatlantic—that subjected their claimants to more inconvenience in the

matter of getting satisfactory settlements than should have been the case. In this connection it is necessary to say that the Hamburg-Bremen was a pleasing exception, in that it used every effort to facilitate the payment of claims to the satisfaction of its assured.

The fact remains, however, that the German companies, as a class, act most ungracefully in the face of extraordinary losses, and seem to take refuge behind every legal technicality that will aid them in making salvage. Unpleasant tho it may sound, the truth seems to be that the conduct of the Austrian Phoenix is characteristic.

✱

ACCORDING to the annual report of the Connecticut Insurance Department, just issued, the aggregate earned premiums during 1911 of the 133 stock fire insurance companies under its jurisdiction were \$257,330,050; losses incurred were \$145,979,390; the underwriting expenses were \$105,879,840; and the underwriting profit \$5,409,590. The losses equal 56.7 per cent. of the premiums; the underwriting expenses are 41.1 per cent., and the underwriting profit 2.2 per cent. Sixty-seven of the 133 companies lost money on last year's business.

✱

AT a recent meeting of the Association of Life Insurance Presidents a resolution was adopted indorsing the proposal to purchase the birthplace of Grover Cleveland, at Caldwell, N. J., as a memorial. Under the law, the association is powerless to subscribe to the fund, but its members are recommended to do so individually. Mr. Cleveland was the association's first chairman.

✱

IN his report on the Equitable Building fire to the New York Board of Fire Underwriters, Superintendent Stewart states that many safes which went thru that fire did not fully protect their contents, and he recommends that all office safes should be made of heavy iron shells filled with not less than five inches of cement.

Real Estate Mortgages

As an institutional investment the real estate mortgage is gaining in popularity. The head of a long-established bond house, in calling attention to this feature of the situation, stated that the allure-ment of the 5 per cent. mortgage had greatly increased in the past few years. Insurance companies and savings banks are slowly swinging over to this form of investment, prompted principally by the keenness of competition. From the pop-ular viewpoint this is an economic tend-ency which is distinctly in the right di-rection, as it affords the small borrower a better opportunity to obtain his money at a more uniform rate of interest than prevails when he deals with different in-dividuals.

It is estimated that between \$50,000,-000 and \$100,000,000 annually is wasted each year by borrowers on real estate, particularly by those who are endeavor-ing to pay for their homes on the "part cash and part payment on the mortgage" proposition. Specific instances can read-ily be cited where the prospective home owner is unable to meet his mortgage upon maturity and is compelled to pay large commission fees to secure another mortgage. The increasing willingness of life insurance companies and savings banks to invest their assets in this form of security is working toward the erad-ication of this economic evil.

The best method of providing for the needs of the borrower on real estate is exemplified in the French system, known as the *Credit Foncier* or mort-gage bank, and the officials of some of our most prominent and influential trust companies believe that the example started by our French cousins back in 1858 will ultimately be adopted in this country. According to the French sys-tem, the borrower is permitted to make payments which will liquidate his mort-gage in ten years, but liquidation, how-ever, is not required within that period. The time of liquidation can be selected in accordance with the borrower's earning capacity. This bank since its charter

was granted, has loaned over \$1,000,000,-000 and has outstanding mortgages of \$450,000,000, with interest rates at 4 per cent. Of course, it would be difficult to organize in this country a similar insti-tution that would be willing to loan its funds at such a low rate of interest, but already one of the larger trust compa-nies is offering borrowers a mortgage for ten years at $5\frac{1}{2}$ per cent. interest, with the stipulation that 1 per cent. per annum be paid on account of principal.

It is argued that our building and loan associations take the place of the French system. They do to a certain extent, but on account of their limited geograph-ical area they appeal to a comparatively small number of individuals. The latest figures show that these organizations have total assets of \$1,036,712,600 and over 2,000,000 shareholders, distributed for the most part in New York, Chicago, Philadelphia and Cincinnati and their suburbs.

At present the treasuries of the life insurance companies are among the chief sources of funds for loans on real estate. Security holdings of thirty such institu-tions reporting recently to Massachusetts authorities amounted to \$1,734,302,000, which, added to the \$298,839,000 owned by 192 savings banks, passes the \$2,000,-000,000 mark. These aggregates of \$1,-734,302,000 and \$298,839,000 are, re-spectively, 48.2 per cent. and 34.6 per cent. of total assets, and comparison with similar figures for 1906 shows that, with the insurance companies particularly, mortgage loans have run considerably ahead of additions to bond holdings. There is likewise a safe, tho not as large, lead in the case of the savings banks.

While the comparative worth, as in-vestments, of bonds and real estate mortgages is ever a fruitful subject of discussion, the advantage of quick con-vertibility into cash cannot be denied the former. Thus there is a certain point be-yond which these big institutional invest-ors may not go in lending on real estate, it being imperative that a reasonable proportion of assets be kept in liquid form.

The Independent

VOL. LXXII NEW YORK, THURSDAY, MAY 16, 1912

No. 3311

Survey of the World

National Politics In the canvass for the Presidential nomination, public interest was drawn, last week, to Ohio, where the President was making a series of speeches. At Portsmouth he said: "I'm up against the wall. I'm being hit below the belt, and I'm here to fight." When Mr. Roosevelt was asked to comment on this, he said: "When you hear me squealing because I'm hit, you'll notice it." Mr. Taft intended to spend eight days in speaking in his own State. The contest in Maryland was a very close one. Mr. Roosevelt had a small majority of the entire preferential vote, but the supporters of Mr. Taft controlled the State convention, where they decided to yield to Mr. Roosevelt because of the popular majority. It was charged by the Taft manager that a large sum of money had been used for Mr. Roosevelt in Baltimore, and Mr. Roosevelt's manager published a hot denial. In one of his speeches the President asserted that Mr. Roosevelt and the latter's friends in the Senate had emasculated the peace treaties. In a letter to the chairman of the Roosevelt committee in Minnesota, Mr. Roosevelt said there was just one candidate whom it was possible to nominate against the bosses, and that candidate was himself. A vote for Mr. Taft was a vote for the bosses.

"The contest has gone so far as to make it now evident that I certainly can be nominated against Mr. Taft, and that either I shall be nominated or else a reactionary will be nominated. It is also evident that not only every progressive Republican, but every man who believes in decency and honesty in politics, who is against boss rule and for the genuine rule of the people, and is for the elimination of special privilege and for efficient endeavor to secure social and industrial justice, can

achieve his purpose only by supporting my candidacy."

In Los Angeles, Cal., on the 9th, Secretary Knox defended Mr. Taft and attacked Mr. Roosevelt. He characterized the ex-President as a man of "whims, imperious ambitions, vanities and mysterious antipathies," who "would break the rule of his party and his country and his own solemn word to gain the seat of his friend." Mr. Roosevelt's comment was: "I could not expect Senator Penrose's representative in the Cabinet to take any other attitude." Whereupon Mr. Taft's friends pointed out that Mr. Knox had been in the cabinet of Mr. Roosevelt, who then had called him "a great Attorney General."—On the Democratic side there was little excitement, as candidates were not denouncing each other. Mr. Bryan was making speeches against Governor Harmon in Ohio. After he had said that it appeared or was reported that Mr. Underwood's delegates were really in favor of Harmon, Mr. Underwood replied emphatically that this was not true, and that he was making the race for himself. Mayor Gaynor expressed the opinion that Governor Baldwin, of Connecticut, was the best qualified of all who had been named. Governor Wilson was successful in Texas and Mr. Clark in Ohio. In Pennsylvania, at the Democratic convention, State Chairman Guffey and other officers associated with him were ousted by the "reorganizers." The new chairman is George W. Guthrie, formerly mayor of Pittsburgh.

Congress The substitute for the Sherwood pension bill, as agreed upon in conference, was passed last week in the Senate and the

House, and on the 11th it was signed by the President. It increases the annual expenditures for pensions by about \$25,000,000. The vote in the House was 175 to 51.—In a special message, the President has recommended the pensioning of civil employees of the Government, with compulsory retirement at the age of seventy years. Money for the payments would be supplied by compulsory contributions from employees, amounting to not more than 8 per cent. of the salaries, and also by contributions from the Government.—The House voted, last week, to abolish the new Commerce Court. The conclusive vote was 120 to 49, and the Republican Progressives joined the Democrats in opposition to the court. It was asserted by foes of the court that it had served railroad interests and throttled the work of the Interstate Commerce Commission; also that its decisions had been reversed by the Supreme Court. The investigation of Judge Archbald's conduct was not wholly ignored in the debate.—Complaint as to delay in submitting the committee reports in the Lorimer case having been made in the Senate by Mr. Bristow, it has been decided that they shall be filed on the 20th inst.—The Employers' Liability bill has been passed in the Senate, 64 to 15. It provides compensation for employees injured on interstate railroads, and is the fruit of inquiries made by a special commission. Mr. Taft had recommended the enactment of it. The opposition was manifested mainly by those who objected to the provision that employers should not be civilly liable beyond the payments specified in the statute.—In the Senate, last week, Mr. Cummins made a long speech concerning the pending bills for a revision of the tariff duties of the iron and steel schedule, pointing out in what respect, in his opinion, his own bill was better than the one sent over from the House. In the course of his remarks he criticised the President, alleging that the latter, by means of the Tariff Board and otherwise, was attempting to interfere with legislation. He also said that he opposed the recall of judges or of court decisions. Such recalls, however, in his judgment were not so revolution-

ary as executive usurpation of legislative authority by telling Congress what schedules should be revised and in what way the revision should be made. As Mr. Cummins is a candidate for the Presidential nomination, these references to two other candidates excited some interest. It appeared in the course of the debate that the Progressives and the Democrats intend to prevent adjournment or a recess until action upon the pending tariff bills shall have been taken.—In the Legislative Appropriation bill, passed by the House on the 11th, the Democrats have sought to get rid of the Tariff Board by providing for a Bureau of Foreign and Domestic Commerce in the Department of Commerce and Labor, and requiring this bureau to gather tariff information. Reports would be made in response to calls from Congress or the President, and not at the order of the President alone. Mr. Clark said the present board was a partisan body, whose work was done by clerks in the interest of the Republican party. Incidentally, the bill would abolish the State Department's Bureau of Trade Relations, with the offices of several chiefs of division who have had charge of important questions. Vigorous protest is made by Acting Secretary Wilson. It is asserted that the bureau has done work of great value for American manufacturers and exporters, and even that for every dollar paid for the maintenance of it \$1,000 in contracts or in additional sales of goods has been obtained.—The River and Harbor bill, passed last week, appropriates about \$34,000,000.—Mr. Taft, having in mind the recent Supreme Court decision, asks Congress to provide for the appointment of a commission which shall report as to a revision of the patent laws.—A story was published to the effect that the selection of Claudia Lyons, twelve years old, daughter of Cecil Lyons, chairman of the Texas Republican committee, to be sponsor at the launching and christening of the battleship "Texas," had offended Governor Colquitt and the Texas members of Congress, who would not be present at the ceremony. Whereupon the Secretary of the Navy gave to the public let-

ters showing that the appointment had been made at the suggestion and request of Governor Colquitt himself.

The Mississippi Floods At the beginning of last week large parts of fifteen parishes in Louisiana were under water, more than 100,000 persons had been driven from their homes, many were marooned in places where they could be rescued only with great difficulty, and there was much anxiety in New Orleans, where it was feared that new breaks in the levees would flood the city. There was hard work thruout the week upon the levees from Baton Rouge southward. Navy vessels assisted the army in rescue work. Governor Sanders estimated the State's loss at \$6,000,000, and urged that Congress should provide for conservation at the headwaters of the great river. Louisiana, he said, should not be obliged to defend herself against the surplus waters of a score of States. This flood, from Vicksburg southward, has reached a level of from 6 to 30 inches higher than that of any which has preceded it. The Governor says that not more than twenty lives have been lost on account of crevasses, but accidents in rescue work have caused the deaths of a considerable number. On the night of the 10th, a rainstorm, said to have been the heaviest ever known there, increased the anxiety in New Orleans. Six inches are said to have fallen in four hours. But there was no great additional crevasse, and on the 11th the water fell 2/10 of an inch. At the beginning of the present week there was a feeling of relief. The Federal Government has been feeding thousands of refugees. There will be much further loss, because there can be no crops of cotton, sugar or corn thruout a large area of submerged land.

Labor Disputes There has been great disorder at several of the anthracite collieries in Pennsylvania, where the union, which is voting this week on the terms offered for a settlement of the strike, has been unable to restrain many of the foreign miners. Mobs have attacked the few men who were doing necessary work and

have been dispersed by the State mounted police. On the 8th four rioters were shot, one of them mortally. Two days later, at the Lackawanna colliery, five were shot, but none of these has died. The mobs at some places were led by women. On the 11th, the troopers accidentally killed a boy who was not with the rioters.—It is estimated that the demands made by the railroad engineers and firemen, and soon to be considered by arbitrators, would add \$33,000,000 a year to the wage payments of the companies.—In Chicago, the newspapers are overcoming the difficulties caused by the strikes of pressmen and stereotypers. The charter of the stereotypers' union has been taken away because the men went on strike in violation of rules, breaking a contract. In support of the pressmen, however, strikes of pressmen employed on Mr. Hearst's papers in New York, San Francisco, Atlanta and Los Angeles have been ordered.—Recent increases of wages include those granted to 2,500 mill employees in Rockville, Conn.; to the street railway men in New York (\$230,000 a year), and to the paper mill workers in Holyoke, Mass. This last increase was accompanied by an advance in the price of writing paper.—The strike of all the stevedores and harbor engineers which paralyzed business at Havana was settled, it was thought, on the night of the 9th by an agreement providing for a joint commission to make a new wage schedule, but, a few hours after the men had returned to work, on the 10th, it was renewed. There were also sympathetic strikes at Santiago, Manzanillo and Cienfuegos.

Central and South America The pending conventions with Honduras and Nicaragua, relating to loans for the settlement of their foreign debts, were virtually rejected at Washington, on the 8th, when the Senate's Committee on Foreign Relations, by a tie vote, refused to recommend that they be ratified. Mr. Borah, of Idaho, voted with the Democrats in the negative. Mr. William Alden Smith, Republican, of Michigan, was absent. It is understood that he would have opposed the conventions, or treaties, if he had been present. It was proposed in these agreements,

which have been supported earnestly by Mr. Taft and Secretary Knox, that security for the loans should be customs revenue, collected and guarded by American officers, the selection of whom should be approved by our Government. To Honduras one of the loaning syndicates has already advanced \$500,000, and a larger sum has been advanced in Nicaragua, where Americans are engaged in the work which the agreements assigned to them.—It is understood that control of the railways in Guatemala has passed to Mr. Keith and his associates in the United Fruit Company, and that extensions will be built, connecting with the Mexican railway system at the boundary.—Hearing that Chili might ask for a loan of American sanitary experts to deal with an epidemic of yellow fever at one of her ports, our Government has told Chili's President that it would be glad to assist him with respect to this matter.

Mexico The long-delayed battle between Orozco's army and the Federal forces began, about 40 miles north of Torreon, on the 9th, and the troops sent forward by Orozco were defeated. There was hard fighting for two days and the Federals were successful, but President Madero said, on the 11th, that the main body of the revolutionists had not yet been whipped. He was confident that it would be, and the commander of his forces, General Huerta, promised to be in the city of Chihuahua within fifteen days. Orozco was at a disadvantage, fighting in a hot desert with a scant supply of food for his men. Besides, the Government's army used heavy field pieces, and his cannon were small and old. There was a report that a part of Orozco's army had been beaten in the vicinity of Piedras Negras (which is near Eagle Pass, Tex.) and that 600 rebels had been killed there. But this appears to have been untrue. General Salazar, with this part of the army, was able to join Orozco when the latter called for his aid. On Sunday, the 12th, the two main armies fought for twelve hours and at the end the rebels were driven back. They lost ten cannon. About 500 were killed or wounded. In the south the Zapatists made another unsuccessful attempt to capture Cuernavaca. Madero repeated to these bandit soldiers his offer

of amnesty.—Before the battle near Torreon, Emilio Vasquez Gomez, who had himself proclaimed Provisional President at Juarez, was severely snubbed by Orozco, who refused to recognize his new office. He would be glad, he said, to have Gomez enter Mexico and come to him for a conference, but the time for making Presidents had not arrived. Gomez sent to Orozco his "credentials," hoping for recognition. As this was still withheld, he left Juarez in disguise, and it was reported that he had returned to San Antonio.—The transport "Buford," which went down the west coast from San Francisco to rescue stranded or beleaguered Americans, did not find many who desired to leave Mexico. From Altata nineteen were taken on board. The ship's commander reported that he might find 100 passengers at Salina Cruz. From Mazatlan he took ninety and seventy from San Blas. As a rule, the Americans told him they had been well treated. From towns in Coahuila 300 Chinese fled across the boundary. Our Government will probably help them to reach China. A newspaper story from Colorado that our Government was hurriedly collecting cars there for the transportation of cavalry to the border was called untrue and ridiculous by General Wood.—Earthquake shocks, on the 8th and 10th, destroyed property and caused loss of life in Guadalajara, Tepic, Jalisco and elsewhere. Forty-five persons were killed. Guadalajara's cathedral was wrecked. The volcano of Colima was violently active.

Mr. Bryce and Canadian Reciprocity The publication of President Taft's letter to Mr. Roosevelt, referring to the proposed reciprocity agreement with Canada as likely to make Canada an "adjunct" of the United States, has been seized upon by British Unionists as a weapon to use in their party war. Thus on May 6 two members of Parliament, Messrs. Croft and Benn, denounced Mr. James Bryce, the British Ambassador to the United States, for the part he is said to have played in the reciprocity negotiations. Both Sir Edward Grey, the Foreign Secretary, and Mr. Asquith have defended Mr. Bryce against

charges of neglect of imperial interests. Mr. Bryce could have had no knowledge of the Taft-Roosevelt correspondence, they assert, since it was entirely private until published a fortnight ago. Moreover, the question of reciprocity was one for Canada, not for Great Britain, or her Ambassador, to decide upon. "Mr. Bryce had nothing to do with the views or the policy of the late [Laurier] Government in Canada," said Mr. Asquith. Sir Edward Grey stated that the Ambassador, who is now on his way to Australasia to study political and sociological conditions, would return to Washington early in September. —Mr. Foster, Canadian Minister of Trade and Commerce, hopes to arrange a treaty with Australia giving a preference of $33\frac{1}{3}$ per cent. to the goods of each country in the markets of the other, and wants to submit the treaty to the Dominion Parliament simultaneously with the agreement negotiated with the West Indies. —The direct exchange of parcels by post between Canada and France and between Canada and Algeria and Corsica via France went into operation on May 1.

The "Titanic" Case in England

When J. Bruce Ismay, general manager of the White Star Steamship Company, reached Liverpool on May 11, according to newspaper reports, he was cheered as he stepped down the gangplank. He will be examined by the Board of Trade's Commission of Inquiry, under the presidency of Lord Mersey. Witnesses before this commission have testified that more persons would have been placed in the "Titanic's" boats had the officers not feared they would collapse while being lowered. Had they been more fully manned, they might, however, have saved more persons floating in the sea after the ship had gone down. The first lifeboat launched carried less than half its capacity. One of the crew of this boat testified that Sir Cosmo Duff, one of the passengers, objected to picking up any of those struggling in the water, because it "might be dangerous." Lady Duff-Gordon, his wife, who keeps a hat shop in Paris under a *nom de guerre*, joined in the protest against saving the lives of fellow passengers. Subsequently the

Scottish peer gave £5 to each of the crew of the lifeboat. The want of discipline aboard the "Titanic" has been brought out in the British investigation. Fire broke out in one of the bunkers soon after the ship left Southampton, and this fire damaged one of the bulkheads. Apparently four bulkhead doors were opened by order of the chief engineer after they had been closed from the bridge, after collision with the iceberg. —The third steamer to search for bodies at the scene of the "Titanic" disaster is the "Montmagny." Most of those whose bodies were recovered by the "Minia" seem to have perished from exposure, not drowning. —The Peninsular and Oriental Steamship Company, having refused the demands of the Seafarers' Union in regard to lifeboat accommodations and extra men for manning the boats, the union now threatens a general strike.

The Home Rule Bill

The division in the House of Commons on the second reading of the Irish Home Rule bill brought out, on May 9, a vote of 372 for and 271 against this government measure. The majority of 101 votes included 81 votes of Irish Nationalists—the total representation of this party being 84, and 3 not voting. It will be noted that the vote was uncommonly large, but that the British majority of the Government was only twenty. —Two days before the vote on the second reading of the Irish Home Rule bill Mr. Austen Chamberlain (Unionist) argued that the measure involved possible military dangers. It conferred, he said, control over the Royal Irish Constabulary, a semi-military force, after only six years. —The drilling of the Unionist clubs in Ulster has drawn the serious attention of the Government, and the Lord Lieutenant has made a requisition for an immediate return of the names of all officers and non-commissioned officers, active or retired, who are drilling members of the clubs, of Orange lodges, etc.

British Labor

Another British coal strike is said to be threatened thru the dissatisfaction of miners with the awards of minimum wages by the district boards. The miners have demanded five

shillings (\$1.25) as the minimum; in South Wales the board has fixed the minimum wage at 4s. 6½d., or about \$1.13.—On May 11 the London tailors, who have been on strike, resolved by a majority of 25 to return to work.—Tom Mann, president of the Syndicalist Education League, was, on May 9, found guilty of having endeavored to influence British soldiers against the performance of their duty, and was sentenced to six months imprisonment. Mann was arrested on March 21 after the delivery of a speech in sympathy with the coal mine strikers. He urged the troops to refuse to shoot strikers or their sympathizers. Mann admitted his guilt, but pleaded justification. A part of the Liberal press deplores the sentence of the syndicalist, and attacks the law under which he was convicted as prohibiting freedom of speech.

Germany Baron Marschall von Bieberstein, German Ambassador at Constantinople, will replace Count Wolff-Metternich as his country's representative at London. Baron von Bieberstein is held to be the foremost German diplomat, is in his seventieth year, and has held his late office since 1897. It is prophesied that his appointment to the Court of St. James will mark the beginning of a new era in the relations of England and Germany. Curiously enough, it is said to be Von Bieberstein who drew up the Kaiser's telegram to Kruger in 1896, which so agitated the country which he is now ordered to placate. At Constantinople the German Ambassador won for his Government the high favor of the Porte; but the Young Turk revolution swept away all that and left Germany high and dry in Turkey.—The budget committee of the Reichstag adopted on May 11 a resolution, introduced by the Clerical party, asking the Imperial Chancellor to take steps to end dueling in the army, and particularly the practice of making it obligatory for an offended officer to challenge the offender or leave the service. An amendment to this resolution demands the obligatory dismissal of duelers from the army. The Clericals and Socialists supported the resolution, this being one of the very few questions upon

which Catholics and various types of liberals are agreed.—The Saxon coal strike, which lasted for five weeks, came to an end during the last week in April. The mine owners refused to advance wages.

Spain and Portugal The coldness manifested by the public at the recent meeting when Señor Iglesias, the leader of the Spanish Socialists, and other stalwarts joined forces with republican leaders and attacked the Riff war in Morocco, the Canalejas ministry and the monarchy, is regarded as a sign of the strength of the present Government. The King has gone to Tortosa to open an irrigation canal there.—A fresh attempt to restore Manoel to the Portuguese throne is said to include plans for seizing the northern provinces. Attacks have been made on the customs officers in the north and arms have been taken. Republican troops have been ordered north, and arms consigned to Portuguese royalists have been seized by the Government at Pontevedra. Striking textile workers have thrown bombs in Oporto, and the troops have fired upon the rioters. A loss of life resulted on both sides.—Along with other measures presented to Parliament with the view of reducing the country's expenses a proposal has been made to eliminate the clause in the law separating Church and State which grants pensions to the widows and children of priests. This has been well received by all Roman Catholics, as the grant of pensions was a direct attack upon the celibacy of the clergy, a fundamental principle of the Church. Only a small number of the clergy have accepted the law, and most of these belong to the lower ranks.

The Turks and the Italians

Excitement prevailed in Constantinople on May 8 over the receipt of a dispatch from Smyrna stating that the Italian forces in Rhodes had been defeated in a desperate battle, losing 1,000 killed and wounded and as many more prisoners. The Turkish loss also was said to be heavy. No confirmation has been made of this rumor, which is emphatically denied at Rome. It is said

there that the Turkish Governor of Rhodes is a prisoner and will be sent to Italy. Before the Italians occupied Rhodes the Turks released 300 convicts, who are now scattered thru the interior. Many have joined the disbanded garrison. Brigandage is feared.—The Italians have captured the Islet of Larki, west of Rhodes, and its garrison of fourteen men; also the islands of Scarpento, Caxo, Piscopi and Nicyra. The garrisons and civil officers are being transported to Italy. According to the Italian Premier, the Turks hold only five Italian prisoners in Tripoli. The total number of Italians killed since the beginning of the war is stated to be fifty-three officers and 549 men.—The report that Italy would occupy Chios, Charpathos and other islands in the Ægean is officially denied.—The Turkish Cabinet decided on May 8 to expel all Italians from Smyrna. On the same day the Finance Minister signed an agreement with the Ottoman Bank for a loan of \$75,000,000.—In the course of the debate upon a bill for electoral reform in the Italian Parliament the Premier admitted, on May 9, that the extension of the suffrage to women was reasonable, but declared that it would be impossible to enfranchise 6,000,000 women before the civil code had been modified to equalize the legal status of the sexes.

Is China a Volcano? The Chinese Minister of Finance has conceded to the representatives of the six-Power banks their right to know how their loans are to be spent. The immediate loan of \$50,000,000 has been arranged.—It is reported from Tien-tsin that in consequence of a disagreement among the international financiers, the United States and Germany are contemplating independent action.—It is said that Premier Tang Shao-yi will soon retire. The situation in China is far from reassuring. Troops near Chao-yang, Manchuria, have mutinied, and are looting the country. At Tien-tsin and Canton the soldiers may at any time follow this example. Near Canton the countryside teems with thieves and pirates, who, when arrested, are shot; and it is said that hundreds of bodies can be seen

floating in the West River. The famine has reduced natives of Kiangsu and Anhwei to cannibalism. An article contributed to the *Friedens-Warte* of Berlin, by Count Okuma, formerly the leader of the Japanese Progressive party, takes a gloomy view of the political situation:

"To all outside appearance the Chinese revolution has come to an end, but in reality neither in her internal administration nor in her diplomatic relations can we see much light ahead.

"Should the Powers, meantime, attempt to satisfy their territorial ambitions at China's cost and take action tending toward the dismemberment of that vast empire, complications and results which cannot be foreseen will ensue.

"China cannot be allotted among the Powers as Africa was. To attempt such a division would be an operation fraught with danger, because it would be certain to give rise to a general clash of conflicting interests.

"Even the preponderant position in Manchuria which Japan obtained as the result of the war with Russia gave rise at one time to various surmises and suspicions. . . . If such inauspicious suspicions and rumors can be started with respect to the relations of two powers [Japan and the United States] which for historic, economic and political reasons stand as close to each other as any two Powers formally allied to each other can stand, it can well be imagined what would result if the Powers were to take advantage of the present unsettled state of affairs in China. It can be easily calculated what would be the consequence of attempts to establish spheres of influence by intervening in China's domestic troubles or dispatching large bodies of troops.

"It therefore behooves Japan and Great Britain, which of all the Powers have the largest interests at stake in China, to take every possible measure for the preservation of the empire's territorial integrity. I hope for this reason that the Cabinets in Tokyo and London will meet the Chinese situation with the strongest determination to uphold the empire's integrity and maintain the status quo thruout the regions of the Far East.

"If the principles of the Anglo-Japanese alliance are energetically and unmistakably enforced, there will be no room left for engendering suspicions on the part of the Powers.

"The Government and people of the United States, which are so active in promoting all that makes for peace, will doubtless join cordially in the maintenance of the principles of the Anglo-Japanese alliance. The American people will then recognize how mistaken they were in harboring doubts regarding Japanese intentions toward China and Chinese territories.

"China is very much like a volcano on the eve of eruption. Should the eruption take place, the disaster will extend all over the world."

Japan Today.—III.

BY HAMILTON HOLT

[This concludes our series of articles on Japan by our Managing Editor, Mr. Holt. The two previous ones dealt with the people and the internal affairs of the Empire. This one gives some of Mr. Holt's impressions of Korea and Manchuria and discusses Japan's foreign policy, with especial reference to the United States.—EDITOR.]

I HAVE already stated that the key to the understanding of Japan's progress since the Restoration can be found in her two unswerving and highly ethical ambitions—1st, to maintain her national integrity, and 2d, to become the equal of any other nation in the arts of civilization. To realize these two purposes she had, among other things, to become a great commercial nation as well as an agricultural one. By the wealth thus obtained she built up a modern army and navy to preserve her integrity, and fostered education, art and science to secure her rank among civilized states.

Under this economic expansion the population has increased directly with the means of subsistence, so that now it is nearly three times what it was before the Restoration. It is in fact increasing at the rate of about 500,000 a year. Tho the population is now about half that of the United States, all Japan could be put within the State of California, while the arable land could be embraced almost within the State of Maryland. Inasmuch as emigration from Japan has been practically prohibited by America and Australasia, and as Europe is too far away, it is most fortunate that Formosa came to Japan as a result of the China war, and later Korea as an indirect result of the Russian war. Formosa is too hot and Korea too cold for the comfort of the average Japanese, yet already there are 83,329 Japanese in Formosa to 3,000,000 natives, and about 200,000 in Korea to 10,000,000 Koreans. Japan is making of both of these dependencies integral parts of the Japanese Empire, and not mere colonies.

Our trip thru Korea and Manchuria took us to the heart of the far Eastern problem and gave us some idea of the difficulties Japan will have to surmount in assimilating Korea and retaining her primacy in Manchuria.

When Japan took possession of Korea two years ago the "Land of the Morning Calm" was probably the most corrupt country in the world. Old Korea was the synonym for filth, ignorance, sickness and savagery. There were no schools, no courts, no sanitation, no just government. There were even no poetry, no novels, no drama, no story telling, no painting and no sculpture. The Court was a hotbed of intrigue, where 3,000 officials, attendants, eunuchs and sycophants vied with each other in currying favor with those above and oppressing those below. The people lived in filthy mud huts. They were taxed to the last limit of endurance. No merchant dared to keep more goods than would cover a table lest he be "squeezed" by the authorities.

Now all this is changing. Tho the Koreans are still years and years behind Japan, since Japan took charge the Court cliques have been dismissed, foreigners have been protected, Christianity encouraged, the judicial system reformed, the finances rehabilitated, taxation made uniform and regular, industry and agriculture fostered, and property and life protected. Now it is possible for a merchant, for the first time in Korean history, to prosper without being robbed of his wealth by the Government. A beginning has also been made of a modern educational system, while the work of

making the Korean cities sanitary is perhaps the most remarkable feat of Japan's occupancy. In fact, Japan's progress has been marvelous in all departments. Not even England or the United States could have done better.

Of course, there is still much bitter feeling toward Japan on the part of the Koreans, as there is against England in India or against us in the Philippines. The nationality of a nation cannot be extinguished without engendering bitterness that takes many years to die out. This clipping from the *Tarkan Mai Michi Shimpō*, of Seoul, published just after the annexation, will perhaps give an idea of the prevalent Korean temper at the time. The item reads:

"A mad dog in Seoul yesterday bit a Japanese. We should keep dogs of this kind in great numbers."

The hostile feelings, however, are gradually giving way, if one can trust the universal testimony of the foreign residents. The missionaries, some of whom were at first inclined to take Korea's part, are now, with practical unanimity, on the side of Japan, for it is quite evident that the Japanese authori-

ties are not oppressing the people but giving them the blessings of a stable and enlightened government.

For instance, in fourteen out of the seventeen provinces of Korea there is a Korean Vice-Governor serving with the Japanese Governor, and in the other three a Korean is the Governor-in-Chief. Last year \$8,500,000 was appropriated for each of the seventeen provinces. In each province was established a hospital with Japanese doctors and nurses. The Government has put so far some thirty-five primary teachers in the country districts, but the missionaries are still doing the most for education.

In Korea, unlike Japan, Christianity is flourishing. An American resident in Seoul (not a missionary), of exceptional means for knowing what he said, thought that Korea today was in about the same situation as were the Hawaiian Islands when the missionaries first went there and converted the entire people. There are now 205 foreign missionaries in Korea, mostly American Presbyterians and Methodists. There are 807 Christian churches and over 200,000 professing Christians. The churches have, beside

WASHING THE GINSENG IN KOREA

JAPANESE AGRICULTURAL EXPERIMENT FARM AT SEOUL
These pear trees are only four years old

the foreign missionaries, about 400 native pastors. They have also attached to them 350 schools, giving instruction to 15,000 Korean boys and girls; also fifteen hospitals.

The Japanese Government has been so impressed by the work of the Y. M. C. A. at Seoul that it has given it \$5,000 a year, the only sum it has thus far donated for any benevolent purpose.

Tho Korea has lost much of its picturesque-ness, owing to the fact that the mountains are denuded of trees as in China, the people are as interesting in their way as the Japanese. The men are tall, handsome and dignified. The boys and unmarried men look like girls with their long white dresses and braids down their backs. Indeed, the snow-white robes that the men and women all wear impress the Western visitor more than anything else he encounters in the country. A street scene in Seoul or Chemulpo suggests, as Henry Norman once said, the orthodox notion of the resurrection. If the garb of the men with their flowing white robes and little horse-hair, transparent stovepipe hats, tied under their chins by ribbons or a string of

amber beads, is startling to the traveler, the costume of the women is even more so. It suggests the Turkish dress with its curled up pointed straw shoes, its baggy trousers under a short skirt, and its long cloak, often pulled over the face. But in one respect it differs from all feminine dress known to history, for the skirt and jacket frequently do not meet, thus exposing the breasts.

Since the Japanese occupation both the foreign and domestic trade has received a vital quickening. Japan spends \$30,000,000 a year in Korea, of which \$20,000,000 is contributed from the Japanese treasury and \$10,000,000 from taxes on the Korean people. Japan has disbanded the Korean army, but she keeps 20,000 of her own troops in the peninsula.

The two chief claims made against Japan in Korea are that lands have been seized for alleged military necessities without compensation, and that the large inflow of the worst and most adventurous elements of the Japanese population has been followed by personal brutality against the Koreans. These charges are supported by the testimony of many Ko-

reans and foreigners. Just now there is much talk about the Korean Government persecuting native Christians supposed to be complicated in the recent attempt upon the life of Count Terauchi, the Resident-General of Korea. Japan has undertaken a difficult task in Korea, and no doubt excesses have been committed, as is apt to be the case under any strict military rule. But no one who knows Count Terauchi and his record, or is familiar with the policy of the Japanese Government, can think for a moment that their sanction has been given to any deliberate policy of injustice toward the Koreans or the persecution of Christianity.

Korea, as I have said, is an integral part of Japan. Manchuria, however, belongs to China. Japan's only rights in Manchuria consist in protecting, policing and running the South Manchuria Railway, and developing the landed concessions along the route.

Japan is naturally doing everything possible to improve her property. In-

deed, she is spending so much money that one wonders how China can ever pay her back when the various leases expire.

The way Japan can "do things" is exemplified in the two adjacent towns of Mukden, one of them Chinese, the other Japanese. The Japanese town looks like a progressive German city, with modern, substantial homes and office buildings, and brilliantly lighted, broad, macadamized and granite curbed streets. And the Chinese Mukden—dust, ruts, filth, squalor, crime and smallpox epidemics.

In Dairen, the old Russian Dalny, I found even greater evidences of Japanese progress. Tho the city has been under Japanese control only seven years, yet I doubt if there is a municipality in the whole world where such progress has been made in so short a time. The Chinese quarter, once filthy and ill smelling, is being cleaned up. The old Russian part of the city is left pretty much as it was—handsome and substantial. But by far the larger part of Dairen is Japanese

FISH MARKET AT FUSAN, KOREA
A Japanese colony across the bay in the background

MANCHURIA'S STAPLE PRODUCT

Open storing ground for beans and bean cakes on the wharves at Dairen

and has been built up since it came into Japanese possession. It has what no Japanese cities have—wide, asphalted streets, with granite sidewalks and curbs. The population is 37,000 Japanese and 70,000 Chinese. There is a splendid free public school system, with fine buildings and compulsory attendance for Japanese children. The Chinese have free schools for their children, but attendance is not compulsory. I saw a playground with all the most modern apparatus such as could not be excelled in Boston or Chicago. There was also a pretty park and a white pleasure city—a miniature Coney Island. I also visited an exceptionally fine Y. M. C. A. building, the gift, if I remember correctly, of Mr. John Wanamaker. There was likewise a theater, a public assembly hall and a well equipped trolley system, with side doors on the cars. I even noticed an automobile street sprinkler working on the streets, tho there is not another one in any city of Japan.

Thus it is wherever you go—Japan is improving, renovating, modernizing. The railroad itself is as fine as those in the United States. This is natural, since the rolling stock was made in this country. The gage is standard size. I would have thought I was traveling on any train from New York to Washington except for the fact that there were first, second and third class cars, and that many of the Japanese passengers climbed

up on the seats and sat on their heels. The railroad is double tracked for 288 miles, and all employees wear uniforms, even the crews of the freight trains. I was especially impressed by the large brick stations, which averaged, I should think, finer than those belonging to any railroad in the United States.

Japan has already spent \$35,000,000 for improvements at Dairen alone. She has spent altogether \$61,000,000 gold in Manchuria, supplied from England after the war.

Manchuria is larger than England, Germany, Holland, Belgium and Switzerland combined, and, whereas these European nations support a population of 118,000,000 people, Manchuria has only 18,000,000. The country is very much like Iowa in aspect and fertility. It is capable of producing fabulous crops. The treasure of Manchuria is now the bean crop. The prosperity of the whole country depends on it. Everybody in Manchuria "knows beans."

Russia now controls the railroad in the northern half, where naturally her influence predominates. Japan controls the southern half.

China, of course, could hardly be expected to relish the foothold of either Russia or Japan, and the whole situation has become complicated by the commercial entrance of England, France, Germany and the United States, who are straining every nerve to gain a trade

ascendency in the province. China is now apparently trying to play the European Powers against Japan. Japan's one great diplomatic failure has been her inability to placate China, so as to stop this.

Does Japan want to seize Manchuria? There are those who think so. There are likewise those who think she wants to seize Australia, the United States and South America. If Europe were not so far away she would doubtless be accused of having nefarious designs on the Old World.

There is unfortunately a small jingo element in Japan who wish to "lick all creation." There is likewise a small element—somewhat like our Boston Anti-Imperialists—who want Japan to get out of Formosa, Korea and Manchuria altogether. The great bulk of the Japanese people, however, have no desire for any national aggression. They look upon their advent in Korea and China as a solemn duty necessary to their own self-preservation. Of course, Japan is primarily on the mainland for her own good. But, as I have tried to show, she is no merciless exploiter or oppressor. She is, with honesty, courage and ability, developing the arts of peace and civilization wherever she goes, and at great cost to herself.

I can perhaps best explain my views of Japan's foreign policy by quoting the following letter that I wrote while in Japan to the secretary of the Australian peace society:

MR. E. B. DILLON,

Hon. Secretary of the Melbourne Peace Society.
